Chambers's Journal

SEVENTH SERIES

THE DAY OF WRATH.*

A STORY OF 1914.

By LOUIS TRACY, Author of *The Final War*, *Rainbow Island*, *The Terms of Surrender*, &c.

Gloster, 'tis true that we are in great danger;
The greater, therefore, should our courage be.—*King Henry V.*

CHAPTER I.—THE LAVA-STREAM.

'FOR God's sake, if you are an Englishman, help me!'

That cry of despair, so subdued, yet piercing in its intensity, reached Arthur Dalroy as he pressed close on the heels of an all-powerful escort in Lieutenant Karl von Halwig, of the Prussian Imperial Guard, at the ticket-barrier of the Friedrich-Strasse Station on the night of Monday, 3rd August 1914.

An officer's uniform is a *passe-partout* in Germany; the showy uniform of the Imperial Guard adds awe to authority. It may well be doubted if any other insignia of rank could have passed a companion in civilian attire so easily through the official cordon which barred the chief railway station at Berlin that night to all unauthorised persons.

Von Halwig was in front, impartially cursing and shoving aside the crowd of police and railwaymen. A gigantic ticket-inspector, catching sight of the Guardsman, bellowed an order to 'clear the way,' but a general officer created a momentary diversion by choosing that forbidden exit. Von Halwig's heels clicked, and his right hand was raised in a salute; so Dalroy was given a few seconds wherein to scrutinise the face of the terrified woman who had addressed him. He saw that she was young, an Englishwoman, and undoubtedly a lady by her speech and garb.

'What can I do for you?' he asked.

'Get me into a train for the Belgian frontier. I have plenty of money, but these idiots will not even allow me to enter the station.'

He had to decide in an instant. He had every reason to believe that a woman friendless and alone, especially a young and good-looking one, was far safer in Berlin—where some thousands of Britons and Americans had been caught in the lava-wave of red war now flowing unrestrained from the Danube to the North Sea—than in the train which would start for Belgium within half-an-hour. But the tearful indignation in the girl's voice—even her folly

in describing as 'idiots' the hectoring Jacks-in-office, any one of whom might have understood her—led impulse to triumph over saner judgment.

'Come along! quick!' he muttered. 'You're my cousin, Evelyn Fane!'

With a self-control that was highly creditable, the young lady thrust a hand through his arm. In the other hand she carried a reticule. The action surprised Dalroy, though feminine intuition had only displayed common-sense.

'Have you any luggage?' he said.

'Nothing beyond this tiny bag. It was hopeless to think of'—

Von Halwig turned at the barrier to ensure his English friend's safe passage.

'Hallo!' he cried. Evidently he was taken aback by the unexpected addition to the party.

'A fellow-countrywoman in distress,' smiled Dalroy, speaking in German. Then he added, in English, 'It's all right. As it happens, two places are reserved.'

Von Halwig laughed in a way which the Englishman would have resented at any other moment.

'Excellent!' he guffawed. 'Beautifully contrived, my friend.—Hi, there, sheep's-head!'—this to the ticket-inspector—'let that porter with the portmanteau pass!'

Thus did Captain Arthur Dalroy find himself inside the Friedrich-Strasse Station on the night when Germany was already at war with Russia and France. With him was the stout leather bag into which he had hurriedly thrown such few articles as were indispensable—an ironic distinction when viewed in the light of subsequent events; with him, too, was a charming and trustful and utterly unknown travelling companion.

Von Halwig was not only vastly amused, but intensely curious; his endeavours to scrutinise the face of a girl whom the Englishman had apparently conjured up out of the maelstrom of Berlin were almost rude. They failed, however, at the outset. Every woman knows exactly how to attract or repel a man's admiration;

this young lady was evidently determined that only the vaguest hint of her features should be vouchsafed to the Guardsman. A fairly large hat and a veil, assisted by the angle at which she held her head, defeated his intent. She still clung to Dalroy's arm, and relinquished it only when a perspiring platform-inspector, armed with a list, brought the party to a first-class carriage. There were no sleeping-cars on the train. Every *wagon-lit* in Berlin had been commandeered by the staff.

'I have had a not-to-be-described-in-words difficulty in retaining these corner places,' he said; whereupon Dalroy gave him a five-mark piece, and the girl was installed in the seat facing the engine.

The platform-inspector had not exaggerated his services. The train was literally besieged. Scores of important officials were storming at railway employes because accommodation could not be found. Dalroy, wishful at first that Von Halwig would take himself off instead of standing near the open door and peering at the girl, soon changed his mind. There could not be the slightest doubt that were it not for the presence of an officer of the Imperial Guard he and his 'cousin' would have been unceremoniously bundled out on to the platform to make room for some many-syllabled functionary who 'simply must get to the front.' As for the lady, she was the sole representative of her sex travelling west that night.

Meanwhile the two young men chatted amicably, using German and English with equal ease.

'I think you are making a mistake in going by this route,' said Von Halwig. 'The frontier lines will be horribly congested during the next few days. You see, we have to be in Paris in three weeks, so we must hurry.'

'You are very confident,' said the Englishman pleasantly.

He purposely avoided any discussion of his reasons for choosing the Cologne-Brussels-Ostend line. As an officer of the British army, he was particularly anxious to watch the vaunted German mobilisation in its early phases.

'Confident! Why not? Those wretched little *piou-pious*'—a slang term for the French infantry—'will run long before they see the whites of our eyes.'

'I haven't met any French regiments since I was a youngster; but I believe France is far better organised now than in 1870,' was the non-committal reply.

Von Halwig threw out his right arm in a wide sweep. 'We shall brush them aside—so,' he cried. 'The German army was strong in those days; now it is irresistible. You are a soldier. You know. To-night's papers say England is wavering between peace and war. But I have no doubt she will be wise. That Channel is a great asset, a great safeguard, eh?'

Again Dalroy changed the subject. 'If it is a fair question, when do you start for the front?'

'To-morrow, at six in the morning.'

'How very kind of you to spare such valuable time now!'

'Not at all! Everything is ready. Germany is always ready. The Emperor says "Mobilise," and, behold, we cross the frontier within the hour!'

'War is a rotten business,' commented Dalroy thoughtfully. 'I've seen something of it in India, where, when all is said and done, a scrap in the hills brings the fighting-men alone into line. But I'm sorry for the unfortunate peasants and townspeople who will suffer. What of Belgium, for instance?'

'Ha! *Les braves Belges!*' laughed the other. 'They will do as we tell them. What else is possible? To adapt one of your own proverbs: "Needs must when the German drives!"'

Dalroy understood quite well that Von Halwig's bumptious tone was not assumed. The Prussian Junker could hardly think otherwise. But the glances cast by the Guardsman at the silent figure seated near the window showed that some part of his vapouring was meant to impress the feminine heart. A gallant figure he cut, too, as he stood there, caressing his Kaiser-fashioned moustaches with one hand, while the other rested on the hilt of his sword. He was tall, fully six feet, and, according to Dalroy's standard of physical fitness, at least a stone too heavy. The personification of Nietzsche's Teutonic 'overman,' the 'big blonde brute' who is the German military ideal, Dalroy classed him, in the expressive phrase of the regimental mess, as 'a good bit of a boulder.' Yet he was a patrician by birth, or he could not hold a commission in the Imperial Guard, and he had been most helpful and painstaking that night, so perforce one must be civil to him.

Dalroy himself, nearly as tall, was lean and lithe, hard as nails, yet intellectual, a cavalry officer who had passed through the Oxford mint.

By this time four other occupants of the compartment were in evidence, and a ticket-examiner came along. Dalroy produced a number of vouchers. The girl, who obviously spoke German, leaned out, purse in hand, and was about to explain that the crush in the booking-hall had prevented her from obtaining a ticket.

But Dalroy intervened. 'I have your ticket,' he said, announcing a singular fact in the most casual manner he could command.

'Thank you,' she said instantly, trying to conceal her own surprise. But her eyes met Von Halwig's bold stare, and read therein not only a ready appraisal of her good looks, but a perplexed half-recognition.

The railwayman raised a question. Contrary to the general custom, the vouchers bore names, which he compared with a list.

'These tickets are for Herren Fane and Dalroy, and I find a lady here,' he said suspiciously.

'Fräulein Evelyn Fane, my cousin,' explained Dalroy. 'A mistake of the issuing office.'

'But'——

'Ach, was!' broke in Von Halwig impatiently. 'You hear. Some fool has blundered. It is sufficient.'

At any rate, his word sufficed. Dalroy entered the carriage, and the door was closed and locked.

'Never say I haven't done you a good turn,' grinned the Prussian. 'A pleasant journey, though it may be a slow one. Don't be surprised if I am in Aachen before you.'

Then he coloured. He had said too much. One of the men in the compartment gave him a sharp glance. Aachen, better known to travelling Britons as Aix-la-Chapelle, lay on the road to Belgium, not to France.

'Well, to our next meeting!' he went on boisterously. 'Run across to Paris during the occupation.'

'Good-bye! And accept my very grateful thanks,' said Dalroy; and the train started.

'I cannot tell you how much obliged I am,' said a sweet voice as he settled down into his seat. 'Please, may I pay you now for the ticket which you supplied so miraculously?'

'No miracle, but a piece of rare good-luck,' he said. 'One of the attachés at our Embassy arranged to travel to England to-night, or I should never have got away, even with the support of the State Councillor who requested Lieutenant von Halwig to befriend me. Then, at the last moment, Fane couldn't come. I meant asking Von Halwig to send a messenger to the Embassy with the spare ticket.'

'So you will forward the money to Mr Fane with my compliments,' said the girl, opening her purse.

Dalroy agreed. There was no other way out of the difficulty. Incidentally, he could not help noticing that the lady was well supplied with gold and notes.

As they were fellow-travellers by force of circumstances, Dalroy took a card from the pocket-book in which he was securing a one-hundred-mark note.

'We have a long journey before us, and may as well get to know each other by name,' he said.

The girl smiled acquiescence. She read: 'Captain Arthur Dalroy, 2nd Bengal Lancers, Junior United Service Club.'

'I haven't a card in my bag, she said simply, 'but my name is Beresford—Irene Beresford—Miss Beresford; and she coloured prettily. 'I have made an effort of the explanation,' she went on; 'but I think it is stupid of women not to let people know at once whether they are married or single.'

'I'll be equally candid,' he replied. 'I'm not married, nor likely to be.'

'Is that defiance, or merely self-defence?'

'Neither. A bald fact. I hold with Kitchener that a soldier should devote himself exclusively to his profession.'

'It would certainly be well for many a heart-broken woman in Europe to-day if all soldiers shared your opinion,' was the answer; and Dalroy knew that his *vis-à-vis* had deftly guided their chatter on to a more sedate plane.

The train halted an unconscionable time at a suburban station, and again at Charlottenburg. The four Germans in the compartment, all Prussian officers, commented on the delay, and one of them made a joke of it.

'The signals must be against us at Liège,' he laughed.

'Perhaps England has sent a regiment of Territorials across by the Ostend boat,' chimed in another. Then he turned to Dalroy, and said civilly, 'You are English. Your country will not be so mad as to join in this adventure, will she?'

'This is a war of diplomats,' said Dalroy, resolved to keep a guard on his tongue. 'I am quite sure that no one in England wants war.'

'But will England fight if Germany invades Belgium?'

'Surely Germany will do no such thing. The integrity of Belgium is guaranteed by treaty.'

'Your friend the lieutenant, then, did not tell you that our army crossed the frontier to-day?'

'Is that possible?'

'Yes. It is no secret now. Didn't you realise what he meant when he said his regiment was going to Aachen? But what does it matter? Belgium cannot resist. She must give free passage to our troops. She will protest, of course, just to save her face.'

The talk became general among the men. At the moment there was a fixed belief in Germany that Britain would stand aloof from the quarrel. So convinced was Austria of the British attitude that the Viennese mob gathered outside the British ambassador's residence that same evening, and cheered enthusiastically.

During another long wait Dalroy took advantage of the clamour and bustle of a crowded platform to say to Miss Beresford in a low tone, 'Are you well advised to proceed *via* Brussels? Why not branch off at Oberhausen, and go home by way of Flushing?'

'I must meet my sister in Brussels,' said the girl. 'She is younger than I, and at school there. I am not afraid—now. They will not interfere with any one in this train, especially a woman. But how about you? You have the unmistakable look of a British officer.'

'Have I?' he said, smiling. 'That is just why I am going through, I suppose.'

Neither could guess the immense significance of those few words. There was a reasonable chance of escape through Holland during the next day. By remaining in the Belgium-bound

train they were, all unknowing, entering the crater of a volcano.

The ten-hours' run to Cologne was drawn out to twenty. Time and again they were shunted into sidings to make way for troop-trains and supplies. At a wayside station a bright moon enabled Dalroy to take stock of two monster howitzers mounted on specially constructed bogie trucks. He estimated their bore at sixteen or seventeen inches; the fittings and accessories of each gun filled nine or ten trucks. How prepared Germany was! How thorough her organisation! Yet the hurrying forward of these giant siege-guns was premature, to put it mildly. Or were the German generals really convinced that they would sweep every obstacle from their path, and hammer their way into Paris on a fixed date? Dalroy thought of England, and sighed, because his mind turned first to the army—barely one hundred thousand trained men. Then he remembered the British fleet, and the outlook was more reassuring.

After a night of fitful sleep, dawn found the travellers not yet half-way. The four Germans were furious. They held staff appointments, and had been assured in Berlin that the clock-work regularity of mobilisation arrangements would permit this particular train to cover the journey according to schedule. Meals were irregular and scanty. At one small town, in the early morning, Dalroy secured a quantity of rolls and fruit, and all benefited later by his forethought.

Newspapers bought *en route* contained dark forebodings of Britain's growing hostility. A special edition of a Hanover journal spoke of an ultimatum, a word which evoked harsh denunciations of 'British treachery' from the Germans. The comparative friendliness induced by Dalroy's prevision as a caterer vanished at once. When the train rolled wearily across the Rhine into Cologne, ten hours late, both Dalroy and the girl were fully aware that their fellow-passengers regarded them as potential enemies.

It was then about six o'clock on the Tuesday evening, and a loud-voiced official announced that the train would not proceed to Aix-la-Chapelle until eight. The German officers went out, no doubt to seek a meal; but they took the precaution of asking an officer in charge of some Bavarian troops on the platform to station a sentry at the carriage-door. Probably they had no other intent, and merely wished to safeguard their places; but Dalroy realised now the imprudence of talking English, and signed to the girl that she was to come with him into the corridor on the opposite side of the carriage.

There they held counsel. Miss Beresford was firmly resolved to reach Brussels, and flinched from no difficulties. It must be remembered that war was not formally declared between Great Britain and Germany until that evening. Indeed, the tremendous decision was made while

the pair so curiously allied by fate were discussing their programme. Had they even quitted the train at Cologne they would have had a fair prospect of reaching neutral territory by hook or by crook. But they knew nothing of Liège, and the imperishable laurels which that gallant city was about to gather. They elected to go on!

A station employé brought them some unpalatable food, which they made a pretence of eating. Irene Beresford's Hanoverian German was perfect, so Dalroy did not air his less accurate accent, and the presence of the sentry was helpful at this crisis. Though sharp-eyed and rabbit-eared, the man was quite civil.

At last the Prussian officers returned. He who had been chatty overnight was now brusque, even overbearing. 'You have no right here!' he vociferated to Dalroy. 'Why should a damned Englishman travel with Germans? Your country is perfidious as ever. How do I know that you are not a spy?'

'Spies are not vouched for by Councillors of State,' was the calm reply. 'I have in my pocket a letter from his Excellency Staatsrath von Auschenbaum authorising my journey, and you yourself must perceive that I am escorting a lady to her home.'

The other snorted, but subsided into his seat. Not yet had Teutonic hatred of all things British burst its barriers. But the pressure was increasing. Soon it would leap forth like the pent-up flood of some mighty reservoir whose retaining wall had crumbled into ruin.

'Is there any news?' went on Dalroy civilly. At any hazard, he was determined, for the sake of the girl, to maintain the semblance of good-fellowship. She, he saw, was cool and collected. Evidently she had complete trust in him.

For a little while no one answered. Ultimately the officer who regarded Liège as a joke said shortly, 'Your Sir Grey has made some impudent suggestions. I suppose it is what the Americans call "bluff," but bluffing Germany is a dangerous game.'

'Newspapers exaggerate such matters,' said Dalroy.

'It may be so. Still, you'll be lucky if you get beyond Aachen,' was the ungracious retort. The speaker refused to give the town its French name.

An hour passed, the third in Cologne, before the train rumbled away into the darkness. The girl pretended to sleep. Indeed, she may have dozed fitfully. Dalroy did not attempt to engage her in talk. The Germans gossiped in low tones. They knew that their nation had spied on the whole world. Naturally they held every foreigner in their midst as tainted in the same vile way.

From Cologne to Aix-la-Chapelle is only a two hours' run. That night the journey consumed four. Dalroy no longer dared look out

when the train stood in a siding. He knew by the sounds that all the dread paraphernalia of war was speeding toward the frontier; but any display of interest on his part would be positively dangerous now; so he, too, closed his eyes.

By this time he was well aware that his real trials would begin at Aix; but he had the philosopher's temperament, and never leaped fences till he reached them.

At one in the morning they entered the station of the last important town in Germany. Holland lay barely three miles away, Belgium a little farther. The goal was near. Dalroy felt that by calmness and quiet determination he and his charming protégée might win through. He was very much taken by Irene Beresford. He had never met any girl who attracted him so strongly. He found himself wondering whether he might contrive to cultivate this strangely formed friendship when they reached England. In a word, the self-denying ordinance popularly attributed to Lord Kitchener was weakening in Captain Arthur Dalroy.

Then his sky dropped, dropped with a bang.

The train had not quite halted when the door was torn open, and a bespectacled, red-faced officer glared in.

'It is reported from Cologne that there are English in this carriage,' he shouted.

'Correct, my friend. There they are!' said the man who had snarled at Dalroy earlier.

'You must descend,' commanded the newcomer. 'You are both under arrest.'

'On what charge?' inquired Dalroy, bitterly conscious of a gasp of terror which came involuntarily from the girl's lips.

'You are spies. A sentry heard you talking English, and saw you examining troop-trains from the carriage window.'

So that Bavarian lout had listened to the Prussian officer's taunt, and made a story of his discovery to prove his diligence.

'We are not spies, nor have we done anything to warrant suspicion,' said Dalroy quietly. 'I have letters'—

'No talk. Out you come!' and he was dragged forth by a bloated fellow whom he could have broken with his hands. It would have been folly to resist, so he merely contrived to keep on his feet, whereas the fat bully meant to trip him ignominiously on to the platform.

'Now you!' was the order to Irene, and she followed. Half-a-dozen soldiers closed around. There could be no doubting that preparations had been made for their reception.

'May I have my portmanteau?' said Dalroy. 'You are acting in error, as I shall prove when given an opportunity.'

'Shut your mouth, you damned Englishman!'—that was a favourite phrase on German lips, apparently. 'Would you dare to argue with me?—Here, one of you, take his bag. Has the

woman any baggage? No. Then march them to the'—

A tall young lieutenant, in the uniform of the Prussian Imperial Guard, dashed up breathlessly.

'Ah, I was told the train had arrived!' he cried. 'Yes, I am in search of those two'—

'Thank goodness you are here, Von Halwig!' began Dalroy.

The Guardsman turned on him a face aflame with fury. 'Silence!' he bellowed. 'I'll soon settle *your* affair.—Take his papers and money, and put him in a waiting-room till I return,' he added, speaking to the officer of reserves who had effected the arrest. 'Place the lady in another waiting-room, and lock her in. I'll see that she is not molested. As for this English *schwein-hund*, shoot him at the least sign of resistance.'

'But, Herr Lieutenant,' began the other, whose heavy paunch was a measure of his self-importance, 'I have orders'—

'Ach, was! I know! This Englishman is not an ordinary spy. He is a cavalry captain, and speaks our language fluently. Do as I tell you. I shall come back in half-an-hour.—Fräulein, you are in safer hands. You, I fancy, will be well treated.'

Dalroy said not a word. He saw at once that some virus had changed Von Halwig's urbanity to bitter hatred. He was sure the Guardsman had been drinking, but that fact alone would not account for such an amazing *volte-face*. Could it be that Britain had thrown in her lot with France? In his heart of hearts he hoped passionately that the rumour was true. And he blazed, too, into a fierce, if silent, resentment of the Prussian's satyr-like smile at Irene Beresford. But what could he do? Protest was worse than useless. He felt that he would be shot or bayoneted on the slightest pretext.

Von Halwig evidently resented the presence of a crowd of gaping onlookers.

'No more talk!' he ordered sharply. 'Do as I bid you, Herr Lieutenant of Reserves!'

'Captain Dalroy,' cried the girl in a voice of utter dismay, 'don't let them part us!'

Von Halwig pointed to a door. 'In there with him!' he growled, and Dalroy was hustled away. Irene screamed, and tried to avoid the Prussian's outstretched hand. He grasped her determinedly.

'Don't be a fool!' he hissed in English. 'I can save you. He is done with. A firing-party or a rope will account for him at daybreak. Ah! calm yourself, *gnädige Fräulein*. There are consolations, even in war.'

Dalroy contrived, out of the tail of his eye, to see that the distraught girl was led toward a ladies' waiting-room two doors from the apartment into which he was thrust. There he was searched by the lieutenant of reserves, not

skilfully, because the man missed nearly the whole of his money, which he carried in a pocket in the lining of his waistcoat. All else was taken—tickets, papers, loose cash, even a cigarette-case and favourite pipe.

The instructions to the sentry were emphatic :

'Don't close the door! Admit no one without sending for me! Shoot or stab the prisoner if he moves!' And the fat man bustled away. The station was swarming with military big-wigs. He must remain in evidence.

(Continued on page 19.)

EFFICIENCY.

By GERALDINE R. GLASGOW.

THERE are many useful and efficient women—neat-fingered, well trained, organised, and thorough. They are the pick of the basket, but they are in the minority. When the war broke out they made no fuss, and did not clamour for unsuitable duties. They knew what they could do, and they did it, quietly and competently. The country needed them, and it accepted their services. The clamour and the fuss came from the inefficient.

The only real test of efficiency is work done; but, unfortunately, when work is most needed the time is past for training. We have learned the lesson in our most bitter need; stacks of useless garments testify to it; wasted time, wasted temper, wasted material, speak of enthusiasm, patriotism, and generosity which have ended in smoke.

When war was declared we women sailed, smiling, to the front. Shirts to make? Any one can sew a shirt. Stockings, mufflers, mittens to be made—why not? Every one can knit—it only needs yarn and needles! Many of us laughed at the idea of any special training being necessary to cope with pins and scissors and a paper pattern. The results lie hidden in piles of wasted material, or in the patient unravelling by the competent of the hopeless work of the inefficient.

There is a light-hearted conceit which clothes the ignorant like a garment. They cannot see that, if you make a pair of socks, they should be alike and *both* should fit. I have seen socks with the legs six inches long and the feet twelve! I have seen 'helpless' shirts with tape ties every three inches down the back, and with lace insertion and baby ribbon at the neck. I have seen flannel helmets made like Dutch baby bonnets, and tied with tape under the chin, that no self-respecting soldier could use for anything but a sponge-bag, and which the Church Army generously takes over by the hundred, and cuts up into clothing for the very poor, to whom it is a matter of Hobson's choice. Many of the poor in London earned a living wage last winter by unpicking and remaking the work of the useless and untrained. I know, too, of a wounded man in a temporary hospital in the country who humorously complained to the sister in charge that a zealous and strenuous worker had washed one of his feet, and *dried the other!*

And yet two weeks' teaching snatched from the first nine months of warfare would have made most of these willing workers really efficient. Careful consideration of the wearer and the conditions, even a little common-sense, would have shown that a man badly enough wounded to wear a 'helpless' shirt would not enjoy lying on little knots of hard tape, and would be annoyed by tags of pale-blue ribbon round his neck; that a helmet shape passed by the War Office, and approved by the proper official, must have something in it that an ordinary girl could not evolve out of her inner consciousness 'by the light of nature,' as I heard one flushed and indignant worker express it; and that therefore the proper patterns should be used, and the cutting-out studied as an art. Shirts so full in the skirt and so grotesquely inadequate at the shoulders that they make one smile are waste pure and simple; sometimes, when the need is great and the number of workers limited, it is more of a tragedy than a comedy.

It was the same in every department. Girls who could not roll a bandage, and had never made even an ordinary bed, were angry, rebellious, indignant because they were not accepted as nurses for the sick and wounded. They vaguely felt that devotion and enthusiasm ought to take the place of long, rigorous, careful training, and said openly, 'If I can't do what I like, in the way I like, I shall just do nothing. They can get on without me.'

And yet every one was wanted then as now—every spark of enthusiasm, every breath of kindness and goodwill; patience, tenderness, courage; all the thousand and one manifestations of the youth and strength of the country; and surely and slowly the net has been cast abroad, and the harvest has been gathered in. Girls are learning that sympathy and kindness do not take the place of practical dexterity and trained intelligence—they only add to its value; that the 'light of nature' is a will-o'-the-wisp compared with the most rudimentary knowledge in the making of a shirt; that from sheer want of training there has been a tremendous waste in time and material and in temper; and that the only useful people at a crisis are those who can do a thing well. So, whilst we have had to make an army of soldiers with the enemy knocking at our gates,

we have also had to train an ignorant but willing army of helpers into an efficiency of which they had never even dreamed. We have, to a certain extent, learned the slow and difficult lesson, but we have learned it in tears and blood. At any rate, we have gauged the depths of our own ignorance. If we had been asked a year ago to write down what we could do, I am afraid a great many of us would have put down, 'Anything we are asked,' or words to that effect; now I hope we should more humbly and more usefully find one little act of service in which we were proficient. No amount of willingness can make up for lack of training, and probably experience is the best teacher, but it is a costly one. Amateur work is only permissible when no other is available, or when it can, at any rate, hurt no one but the doer; in the making of clothes, the nursing of the wounded, even the scrubbing of a floor, the expert will always be accepted before the amateur.

'Something of everything, and everything of something,' is a very good motto to start with;

but now, at this very minute, it would be a wise thing if we all made one of those good resolves which so often come—and go—with New Year's Day, to set to work and learn to be efficient in one single thing, if it is only in the making of buttonholes. We have, most of us, muddled through the duties which the war has thrust upon us, because they had to be done, ill or well; but we have not been so thorough as we might have been, and the muddlers never enjoy work as the specialists do. But to be thorough means always a certain amount of dullness and drudgery to begin with, and the young are impatient, and are apt to think that imperfect work will 'do,' or that, at any rate, it will pass amongst hundreds of samples equally bad. They like to plunge into the fray dramatically, with high spirits and untempered weapons, and a khaki uniform, and think more of affixing a label to their work, with 'God bless the soldier who wears this shirt' written upon it, than of making it button and unbutton comfortably.

THE BRAVEST OF THEM ALL

By A. M'L. CLELAND.

CHAPTER I.

'WELL, good-bye, sonny! Sorry, you know; but it can't be helped. Discipline! discipline!' And Uncle Tom gave a kindly pat to the thin left shoulder of the slim little figure standing so stiffly to attention, framed in the dark shadow of the hall door. Then he passed down the steps to the waiting car, where Aunt Christine and Cousin Madge were already seated.

Then the car, having cleared its throat once or twice, began its merry hum, and rolled away across the dry moat where the drawbridge had once been, and so down the short drive to the highroad.

It was a pathetic-looking little figure that stood there so uprightly in the bright sunshine; and perhaps it was that, or the look in the hazel eyes, or a shadow on the earnest face, that made Aunt Christine call out, as they turned away, 'Remember, you are the Guard of the Tower till our return, Jackie!' And then, just before the car finally disappeared in the dip of the road, Aunt Christine looked back, and smiled and waved her hand. For she was not altogether satisfied at Jackie being left behind.

The Guard of the Tower stood motionless, waiting till the car should reappear and begin its long, slow climb up and over Mallam Moor. It crawled along, growing smaller and smaller, till it reached the top. It seemed to steady itself there, a white handkerchief flashed out for a second—that was Aunt Christine, of course—and next moment the car had dropped behind

the hill. And at that Jackie really did feel alone.

Of course it was a fine thing to think he was Guard of the Tower. But if he hadn't—well, if something hadn't happened yesterday, Jackie would not have been left behind whilst Uncle Tom, Aunt Christine, and Cousin Madge drove up, and down, and across the beautiful breezy moors to Stalling Foss, thirty miles away.

And cook and the housemaid, with Fred—who acted as chauffeur-valet-gardener—had been allowed to take a 'long-day' at Minsterton, the spire of whose church you could see from the roof of the Tower. There was a fair at Minsterton, and the servants were not expected back till after dark. Even Grip was away, having been unlucky enough to put his right paw in a rat-trap three days before. He was then enjoying enforced leisure at the house of the Minsterton vet., but was to return that night with the servants.

Well, there was no help for it. Discipline, as Uncle Tom said, was discipline. And, at any rate, Jackie was Guard of the Tower.

Now a guard, of course, has to patrol whatever he is guarding, whether tower, fortress, or castle. So Jackie, after swallowing once or twice something which seemed to stick in his throat, turned round and entered the Tower to make his first patrol.

Then a brilliant idea struck him. He would keep a record of his patrols. A thin black mark on the front step for every quarter of an hour,

with a thick one for the hours, would do very well. Black chalk, he knew, could be found in the studio, so he sped up the steep, twisty stone steps of the Tower to the very top room; and whilst he stands panting at the door for a moment, let me tell you something of Jackie and the Tower.

The Tower was not Jackie's real home. That was in far-away Manchester, a place where you must put up with many very undesirable things, such as electric tramcars, noise, and ever so much black smoke. The Tower really belonged to W. Markham, R.A., Uncle Tom's dearest chum. Jackie had met 'Markham, R.A.,' and had been much impressed by him. He had a great flowing beard, and an almost equally flowing hat, with a brown velvet coat and an orange scarf, such as made even the Manchester people stare when he occasionally summoned up enough courage to pay that smoke-pestered place a visit.

But, being Uncle Tom's dearest chum, it was only natural that when 'Markham, R.A.,' decided to take his velvet coat, his flowing beard, and large hat to the Norwegian fiords, and so give the natives the time of their lives, it was only natural, I say, that he should ask Uncle Tom to leave murky Manchester for a while in exchange for the breezy moors of Northumberland. In other words, 'Markham, R.A.,' offered Uncle Tom the use of his house and home—to wit, Mallam Tower—for a period of six weeks.

By this time Jackie has recovered his breath, after his run up the steep steps of the Tower, and we can now accompany him in his tour round the studio, searching for black chalk.

On the whole he didn't think much of the works of 'Markham, R.A.,' many of whose pictures were hung round the walls of the studio. There were no soldiers in any of them, for one thing; and only a horse or a dog here and there, and even they looked as if they had tumbled into the picture by accident. But, to make up for these deficiencies, many though they were, there was one picture, standing on an easel by itself, that was the joy of Jackie's life. It was the picture of a girl with glad eyes—sweet, gentle gray eyes. There was not much of her, just her head and shoulders. But her glad eyes seemed to look encouragement to Jackie; and her beautiful lips seemed made for—no, I am not going to write the word you are expecting—her lips, I say, seemed as if they could never form themselves to anything but loving curves, or tender quiverings, or smiles of heartfelt sympathy and understanding. They were the kind of lips—though, of course, Jackie did not know anything of this—that a little baby turns to instinctively; the kind, it seemed to Jackie, he had always dreamed about.

So the Girl-on-the-Canvas and Jackie were great chums. Indeed, she ran a very close race in his affections with another girl, not on canvas, but very much in the flesh indeed—to wit,

happy-go-lucky Cousin Madge, at that moment thoroughly enjoying herself in the car, and not thinking of Jackie one tiny bit.

It was to the Girl-on-the-Canvas that Jackie went whenever he felt 'funky' (the word is Jackie's, not mine); and, for I must tell you the whole truth, Jackie very often did feel 'funky.' In fact, it was this general tendency toward 'funkiness' that caused Uncle Tom and Aunt Christine, just before they left Manchester for the moors, to have a very serious talk regarding Jackie.

'He doesn't seem to put on any meat,' said Uncle Tom, who certainly could not be charged with that lack.

'And yet,' Aunt Christine replied, 'he always seems to enjoy his food, and is very healthy.'

You see, Aunt Christine kept a specially warm corner in her heart for Jackie, for reasons which you will understand as we go on. 'Do you think Mr Thompson would let him join the Boy Scouts?'

'He might, if I asked him; though Jackie is terribly small and slight for the Scouts. However, I'll speak to Thompson about it tomorrow.'

'Jackie,' he said next day, 'would you like to be a Boy Scout?'

Jackie doubted if he had heard aright. To be a Scout was the dearest and most secret wish of his whole life.

'You would, eh!' as Uncle Tom noticed how the boy's eyes blazed. 'Then come along with me, and we'll see the scoutmaster.'

The scoutmaster seemed to live in a large room in the upper floor of a tall building in a lane off Deansgate. The stairs leading to it rather tried Uncle Tom, who had, as I have already hinted, a good deal of meat to carry. There were some scores of Boy Scouts there, though Jackie hardly noticed them, all his attention being fixed on the scoutmaster. This gentleman was a resplendent being, very tall, whose moustache could be almost seen if looked for in a good strong sidelight; and he had cultivated a deep gruff voice, the product of much painful effort and trouble. And words fail me to describe his uniform. This magnificent creature Uncle Tom drew aside (and quite familiarly, by a button-hole), and conversed with in a low tone for some moments. Both of them glanced occasionally at Jackie, standing stiff as a ramrod by the door.

The scoutmaster approached him with easy strides, Uncle Tom by his side. Jackie's heart beat high. What would the decision be?

'So this is the boy who wishes to join? He certainly looks small.—You think you can stand it, Jackie?'

'Yes, sir!' the words coming out in the one-millionth part of a second.

The scoutmaster looked at him a moment or two, resting his chin on his right hand.

All of heaven (at least Jackie's heaven) trembled in the balance.

'Very well,' in his gruffest voice, 'let him join next week.'

And no scoutmaster ever was or ever will be rewarded with such a look of whole-hearted devotion as Jackie then gave.

But before next week came Uncle Tom and all the family had been whisked off to Mallam Tower, ere Jackie had even had time to get his Scout uniform.

Nevertheless, he was now a Boy Scout; though, as he honestly explained to various kind friends, he was 'only just' one.

Now when Jackie had made ten rounds of the Tower his thoughts began to turn longingly toward lunch. The sun by this time had grown so hot that he had removed the camp-stool he used as a seat to the cool shelter of a laurel-bush growing near the door, and sat there in great content reading the last number of *The Modern Boy*.

So absorbed was he that he never heard stealthy steps approach from the rear of the laurel-bush, and had no idea anybody was near till two strong and dirty hands gripped his arms from behind, and a raspy voice, breathing hotly, whispered in his ear, 'Give a single squeak, an' I'll bash yer 'ead off!'

Jackie turned his startled eyes upward, whilst his heart went beat-two-skip-one as fast as ever it could. He saw an evil-looking face bending over him, the forehead surmounted by a ragged fur cap. Beneath the forehead were two bleared eyes, rather close-set, and below them a twisted nose; while underneath the nose was a cruel-looking, thin-lipped mouth.

Jackie's reading had been extensive enough to convince him at once that here was a burglar. But somehow the actual thing was not exactly what the editor of *The Modern Boy* had led him to expect.

'Get up!' the burglar commanded, giving Jackie a jerk from the camp-stool.

But when he had stood the small, slightly built boy in front of him, still keeping a strong grip on one of his arms, whilst he sat himself down on the stool, 'W'y,' he exclaimed, 'cipher me if it isn't on'y a nipper!'

He stared hard at Jackie, who stared just as hard back again, with never the move of an eyelash.

'W'ere's yer dad?' the burglar rasped out.

'My father is dead,' Jackie quietly replied.

'Who's 'im as went off in the car, then?'

'That was Uncle Tom.'

'An' w'ere's yer ma?'

But to this question Jackie gave no answer, for no one ever mentioned his mother, not even kind Aunt Christine. And, young as he was, Jackie somehow knew that he must not talk of his mother. Other boys might talk of their mothers, and refer to them in various terms,

according to the immediate circumstance that happened to prompt them, but not Jackie.

'I live with Uncle Tom and Aunt Christine,' he said when the burglar had repeated his question.

'An' w'en will they be back?'

'Not till the evening.'

'An' the servants?'

'They've gone to the fair at Minsterton; they won't be back till night.'

'But ye've a dawg! W'ere's the dawg? No gammon, mind!'

'He's at Minsterton too,' Jackie replied, quite steadily. He was standing all this time upright as a lath; no stammering; and, strange to say, not the least sign of 'funkiness.'

'Cipher me!' the burglar exclaimed again. 'On'y a nipper!' And the thin lips half smiled. 'Come out o' this blawsted 'eat, sonny!' he said, almost kindly, as he rose from the camp-stool; and, pushing Jackie in front of him, he led the way up to the entrance-door.

But when he entered the cool and shady hall he started back suddenly, and his hand gripped Jackie's shoulder painfully. 'Didn't yer say, sonny,' he whispered hoarsely, 'there was no one 'ere but yerself?'

'Yes, sir; no one.'

'Then w'at's yon?' and the burglar pointed to a dim figure in a far corner.

'That's a knight,' said Jackie. 'His armour.' Then, as the burglar still seemed puzzled, he added, 'Only his clothes, sir.'

'So!' said the burglar. He loosened his grip on Jackie's shoulder and walked cautiously toward the figure, with his fists closed and his arms partly raised.

'Cipher me!' he said, when he had come near enough to take in the details of helmet, visor, breastplate, and other pieces of armour.

'He lived a very long time ago,' Jackie explained.

The burglar examined the gentleman attentively and with great interest. 'Say, sonny, 'ow did 'e drink or smoke?'

This was a puzzle to Jackie. It presented a point of view that was new to him. But he grappled with it, though perhaps not quite successfully. 'I—I—don't think they drank or smoked in those days.'

'Pore beggars!' said the burglar feelingly. Then he wagged an arm of the knight, and tapped his metallic chestpiece as if he were a doctor sounding a patient. 'Tin-pot Tommies!' he exclaimed. 'Cipher me!'

Just then he caught sight of the drawing-room through the open door of the hall.

I call it drawing-room, but the man who built it called it the banquet-hall. How ever, that was a long time ago—in fact, in the days when good King Hal was having such a jolly time with his domestic quick-change farces.

Now 'Markham, R.A.' had travelled a great deal. Jackie, who was deplorably weak in geography, used to have bad headaches when he tried to remember the many places 'Markham, R.A.' had visited in his rambles. And in the drawing-room, hanging on the walls, lying on the tables, or snugly ensconced in various cases, were scores and scores of his travelling souvenirs.

Bows and arrows, spears, shields, cunningly made twisty knives for giving an enemy an extra squirm, swords, and daggers hung on the walls. Beautiful things in copper and bronze were on the tables, or stood in the deeply mullioned window recesses; and on one table in the centre of the room were dozens of articles in most delicate Indian silver.

This table at once attracted the burglar's attention. He looked at the articles and sighed; took them up and fingered them lovingly; then glanced at Jackie, and put them down again.

'Cipher my eyes!' he muttered. 'On'y a nipper!' His mouth seemed to water as he gazed at the beautiful things. In a fit of abstraction, or perhaps from mere force of habit, he quietly slipped one small box into the side-pocket of his greatcoat. Not too quietly, though, for the Guard to observe the action. Then he sighed again, and turned to look at some other things.

A short, heavy stick, with a very bulgy end-bit, caught his eye. He took it from its place on the wall and examined it with great care. 'W'at's this, sonny?' he asked, as he balanced the stick in his hand and made passes in the air with it.

'That's a knobkerrie,' the Guard explained. 'The natives of Fiji use it to fight with.'

'Ah! I should think so! Ye could crack nuts with this—eh?'

'Oh, yes!'

'Coco-nuts perhaps?' said the burglar, with a grin.

'Oh, yes; the Fijians have lots of coco-nuts,' said Jackie doubtfully.

'W'ere's that place, nipper—that Fusee you talked off?'

'Oh, it's—it's—it's in South America.' Remember, please, Jackie was weak in geography.

Having made a tour of the drawing-room, the burglar crossed the hall into the dining-room.

'W'at!' he exclaimed, as soon as he entered; 'more tinned Tommies!' For there were several suits of armour ranged round the walls of the dining-room, like so many dumb-waiters.

Here again I must explain that when the Tower was built the room Jackie and the burglar now stood in had been the guard-room of the Tower. It had a vaulted stone ceiling and a huge fireplace, up the chimney of which the flames used to roar when the winter north winds blew across the moor.

But the burglar's attention was distracted

from the knights by the sight of a meal spread out on the table in the middle of the room.

'Take your lunch, Jackie dear, at two o'clock,' Aunt Christine had said on leaving. 'I have left it all ready for you.' And certainly it was a very nice-looking lunch—some tempting slices of beef, balanced by a crusty little loaf on a wooden trencher, strawberries and a small jug of cream, and a slab of cake.

Perhaps there were rather too many strawberries and too much thick cream for a boy who was being 'disciplined.' But that was just Aunt Christine all over. She never forgot for one moment that Jackie's father was dead; that his mother must not be spoken about.

The burglar's eyes glittered when they lighted on the beef. He dragged a chair across the stone floor to the table, sat down, and then tore the loaf in two, and to Jackie's quiet, watchful eyes seemed to throw the beef into his mouth as if it were so much coal.

'Got no pickles?' he asked, looking about the table, with his mouth full of beef.

'I don't like pickles,' Jackie replied. 'They make my stom— I mean,' he stammered, 'I don't think pickles are good for me. But,' he added, seeing the burglar looked disappointed, 'I think I can get you some;' and he rose and walked toward the door.

A heavy hand was laid on his shoulder as he passed the end of the table. 'No, you don't, sonny! Fraction my eyes if you do!' the burglar growled. 'We will look for them pickles together. See?'

So Jackie led him to the kitchen, and there they found a full bottle of pickles, to the burglar's great joy. On their return to the dining-room the Guard was fascinated as he watched the way the burglar crunched up the pickles with every evidence of satisfaction. Jackie wondered, though, what kind of a pain his stom— or rather, I should say, he doubted if so many pickles were good even for a hairy-capped burglar.

There was silence for a few moments, except for the noise, the very great noise, the burglar made when eating. He ground up beef, crusty bread, and pickles in a marvellously loud way.

'What about drink, sonny?' he next asked thickly, his mouth being full of pickles and beef.

'There is some milk,' Jackie replied, pushing a jug across to him.

'Milk! Me!' the burglar said, disgusted. 'Not much! I'm not a baby cub. W'at about beer?'

'There is beer in the cellar.'

'Come along, then, and we'll draw some. You keep the milk. Cut ahead, sonny.'

So Jackie led the way to the kitchen again, and so to the cellar, which was entered by a little stone-flagged passage off the kitchen.

(Continued on page 27.)

TORPEDO-BOATS AT WORK.

WAR had been in progress about a month, bringing nothing of excitement to the torpedo-boats of the patrol flotillas working from a certain port on the East Coast.

Occasionally a porpoise would break surface near the ship, causing us to conjure up visions of D.S.O.'s and V.C.'s before we realised that it was only a fish and not a submarine. On two occasions we had narrowly missed ramming a certain buoy in the early morning twilight, thinking that we had caught 'Fritz' at last sunning himself on the surface. But small excitements such as these are soon forgotten, and we were one and all bemoaning our luck in being in the 'oily wads,' more correctly termed 'coastal torpedo-boats,' where we seemed to have all the work and very little chance of any real excitement or danger.

Oh yes! I have forgotten one real excitement that we had, but as it turned out to be a 'busted flush,' I will not dwell upon it.

We were passing a certain defended port where there were some very strong searchlights. Being about five miles out from the shore, we knew that the local 'grabbies' would not see us, although their lights made us plainly visible to one another as they switched by us. Occasionally, when they dwelt on us for possibly ten or fifteen seconds, which seemed like an equal number of minutes, we could easily read a signal, find the sugar that the sub. had brought up for the cocoa and dropped on the deck as he arrived, or see the time by the deck watch, which was always at hand, lying on the chart-table.

Five times had these lights switched on to us, paused, and then passed on to search for a possible, though very improbable, enemy vessel, without giving the 'grabbies' or us any cause for palpitation of the heart. The sixth time, however, produced unexpected results. The lights had passed the first three boats, and by chance had dwelt on the fourth and last boat. Suddenly a crash, a sheet of flame, and her foremost gun sent a projectile hurtling out to sea. At the same time we could see her heel over as her helm was put 'hard aport,' black smoke belched forth from her funnels, and in next to no time she had disappeared to seaward. We, the other three boats, all followed her, and with every one at his fighting station and feeling supremely happy, we crashed through the water at twenty-five knots in pursuit of the unknown enemy.

Our excitement grew intense when a wireless message was brought up saying that it was a German destroyer that had been seen, and, as though to remind us that it was not a dream, every now and then we heard the leading boat firing her gun. After a further two or three minutes, during which time we had been steaming directly away from the shore and the searchlights, we got the news that the enemy had now

disappeared, but that when last seen he was steering south-east, apparently at full speed, as he rapidly drew away from our twenty-five-knot confrère. We continued the chase for some two hours, when we were ordered to return to our previous duty, and with that awful feeling of dejection that follows upon excitement disappointed, we retraced our path. However, we afterwards unanimously agreed that we had had all the excitement that was to be had from nothing, as it was then conclusively proved that the last boat had fired at and chased—her shadow.

Life consisted of routine, hard work, sleeping, and eating, with no leave and not always too much fresh food, if we stayed at sea longer than had been expected. It must be explained that a torpedo-boat's work is done almost entirely at night, and that her strength lies in being absolutely invisible and instantly ready for action; so that our lives had been turned upside-down, and we worked at night—say from six P.M. till six A.M.—and filled up with fuel, water, &c., and slept during the day, trusting that when we woke up the daily allowance of fresh provisions would be found on the upper deck like manna from heaven; only they came from the paymaster of our parent ship instead of from above.

It was about five A.M. on a beautiful September morning when the same four 'oily wads' were steaming slowly and independently toward an appointed rendezvous, whence they would return to their base. By some mischance our fresh provisions of the day before had failed to turn up, and so it was with much smacking of lips that we steamed close up to a trawler that was on her way into port and suggested an exchange of baccy for fresh fish. However, the captain seemed bad-tempered, ill-disposed to trade, and would not stop his ship; so we reluctantly turned away and continued our course. Before we had gone more than half a mile we heard the trawler's siren sounding, and on looking round saw that she had stopped.

Congratulating ourselves that the skipper must have found his tobacco-pouch empty after all, we turned round once more, sent down to tell the steward to be ready to take some of the fish for the ward-room as soon as it should be on board, and then stopped close alongside the trawler, with all hands getting out the dinghy. Our hopes of fish were short-lived, for, before the dinghy had been lifted out of her crutches, we were hailed by the captain of the trawler and asked whether we carried a doctor, as he had five wounded men on board. Then followed a long yarn of how, during the night, four trawlers with gear down had unsuspectingly steamed into a minefield, and, ere any of them realised their danger, three vessels had been blown up; and how he, having cut his gear adrift,

had picked up all the survivors he could find, and had steamed back for port, the only one left to tell the tale. Having no doctor on board, we offered to take over our 'medicine-chest' and do what we could to relieve the wounded; but after a good deal of shouting we thought that it would be best for him to make for harbour, whilst we asked by wireless that doctors might come out in a tug to meet him.

So he crawled on into harbour; and we, still without the fish, resumed our course, increasing speed to make up for lost time, and made the request for doctors as soon as we had briefly reported by wireless all we knew to the senior officer at our base.

We reached our rendezvous, joined up with the other three boats, and steamed back into harbour to the accompaniment of much flag-wagging and shouting through megaphones from the people who wanted to hear all the latest news.

We filled up our oil-tanks, had a splendid breakfast of corned beef and cocoa, and were on the point of casting off from the oil-tank to go up to our moorings, when up came the signal, 'Torpedo-boats proceed and endeavour to locate minefield. Warn merchant-ships of the danger. Mine-sweepers will follow.'

All our visions of going to bed disappeared in a flash. We turned round, formed single line ahead, and were soon steaming twenty-five knots toward the supposed position of the minefield. I think it must have been seven A.M. when we passed through the harbour-entrance, and by eight-thirty we were very near the scene of last night's tragedy, by dead reckoning. We spread out till we were about three miles apart, our boat being the southernmost one, with orders to prevent any ship entering the dangerous area, and to keep a sharp lookout for mines. We steamed slowly up and down and round about without seeing anything of interest excepting one suspicious-looking black thing under water, which we at once reported.

Coming to the conclusion that mines were as dull as everything else that we had experienced, we turned the conversation gradually to general subjects; and one seaman, standing below the bridge, was heard betting another his 'tot' that in the event of our hitting a mine, his (the speaker's) lower jaw would go higher than any part of the other man. The bet was duly agreed to, but luckily still remains undecided.

At ten-thirty, nothing more having been seen, I went down to the ward-room to wash, shave, and smoke.

I had partially completed my 'cleaning,' and was still stripped to the waist, when I heard a terrific roar, immediately followed by a sensation as though we were being lifted out of the water, and a horrible hissing noise like water being sprayed against the ship's side. Convinced at once that we had struck a mine near the bow, I rushed up the ladder expecting to find the forepart of the ship missing altogether, but instead

found every one on the bridge looking aft at me. Apparently they had felt exactly the same sensation as I had, and jumped to the conclusion that the stern had gone. On looking round we discovered a column of water some two hundred feet high and about four hundred yards distant. Why that mine exploded we never knew, but from later experience I think that two must have dragged together and then exploded, as no subsequent explosion that I heard was anything like so severe.

Well, we had accomplished part of our work. We had located the minefield. The next thing was to prevent any merchant-ship from 'trespassing,' and, of course, to keep out of trouble ourselves.

One mine does not make a minefield any more than one tree makes a forest, and the question was, where were the remainder of the mines? We knew where another was, or, rather, had been, almost immediately, as a second boom came from the northward, and shortly afterwards the northernmost boat reported that a mine had exploded near her, and that she had seen another floating on the surface. This cheered us up considerably, as we were now convinced that we were on or near the southern end of the field, and so we steamed cautiously to the southward for about another mile, then turned west and proceeded to a steamer that was standing into the zone of danger. Having given her the necessary directions, we continued our patrol, and seeing no prospects of further excitement, I again retired to the ward-room to complete my toilet. The best manservant in the world would probably have been rather neglectful of his duties under such conditions, but a brand-new third-class domestic—straight from the barracks at Portsmouth, frightened to death of the cook (who is 'hot-water king' in a ship), and very excited about the mines—was next to impossible. I struggled for nearly three-quarters of an hour before I was dressed, and then, with a big pipe in my mouth, I wandered up to the bridge to survey the ocean round.

There was nothing going on. A big three-masted sailing-ship was in sight right away to the southward and steering east, and the nearest torpedo-boat had, for some unknown reason, come down our way, and was about two miles to the north-east of us. The wind had fallen away to nothing, so that there was hardly a ripple on the sea, and we basked in the sun and watched the antics of our friend the torpedo-boat with all thoughts of war banished from our minds.

There was a distant boom, and I was just wondering who had been scared by *that* mine, when the sub. shouted, 'By God! the sailing-ship!' I looked round to where a minute previously she had been sailing along. There was the ship, seen as plainly as ever, only cut clean in two just abaft the foremast. Masts, yards, and

rigging were hanging in hopeless confusion, and in less time than it takes to tell the bows rose up in the air and disappeared, leaving only the after-part of the ship in view. Telegraphs were put to 'Full speed ahead,' and the helm put over so as to bring the wreck right ahead; but before we were turned round there was no sign of the ship at all. We had some four miles to go to her rescue, which gave us time to hoist out the dinghy, &c.; and we were also having an exciting race with the other torpedo-boat.

Some one on the bridge murmured that he thought we should probably be able to settle the bet about the lower jaw at any moment; but just then there was a shout of 'There she is, sir,' and away on our port bow we saw masses of wreckage. It was hard luck that she was on that side, as it meant that the other torpedo-boat would get there first; but though such things flash through one's mind, they don't stay to worry one, and by now we had altered our course and were practically there—second. 'Full speed astern both,' and the dinghy was in the water and pulling away amongst the wreckage almost before you could say 'Knife.'

Of the picking up of the survivors little can be said. The ship was the *Gaea* of Svenborg, with a cargo of coke and coal, and a crew of seven men. Four, including the captain, were saved, the remaining three having, in all probability, been blown to bits.

Floating on the water, and covering an area of about an acre, was an indescribable mixture of wreckage; cans, wood, masts, sails, and boats, all covered with bits of coke and coal, strewed the surface; and a little farther off floated a large, spherical, spiky-looking object—a mine. Having thoroughly examined all the wreckage to make sure there were no more survivors, we picked up two life-buoys as mementos, hoisted in the dinghy, and then sank the mine with rifle-fire.

About an hour had now elapsed since the explosion, and all events having been reported to

the senior officer at our base, we already had our orders. One torpedo-boat was to remain in the vicinity of the wreck, and another was to find the mine-sweepers and inform them of the extent of the field as far as was known, and then return to harbour.

The other torpedo-boat elected to remain behind, and so we went off to find the mine-sweepers. After consideration, we came to the conclusion that our safest course, so as to keep clear of the mines, was to go by the route the sailing-ship had come, as we knew there were mines to the northward. So we proceeded west at slow speed, with lots of 'lookouts' up aloft, the mast looking more like a Christmas-tree than anything else. After going about a quarter of a mile there was a cry from aloft of, 'Mine ahead, sir;' and there, sure enough, we could make out the prickles just showing above the surface. So we altered to the north-west, a course, as it turned out, which led us into the thickest part of the field.

Things began to move rapidly now. There was a constant stream of reports coming from aloft—'Mine ahead, sir;' 'Mine on the port bow, sir;' 'There is one, sir, right alongside;' and on looking over the bridge I saw a mine about two feet below the surface, and so close that we could have touched it with a boat-hook. Under these circumstances it was quite impossible to steer a straight course; so we always turned away from the last mine seen, and steered between north and west when possible.

After an hour we at last sighted the mine-sweepers, which had already started work; and a quarter of an hour later we were behind them, and consequently in clear water.

While we were making our report to the senior officer of the mine-sweepers, several mines were exploded by them, and it was without any sort of regret that, at last, we headed for port, and heard the horrible 'bomb' and 'swish' of the exploding mines becoming more and more indistinct.

SEAWEED AND ITS USES.

By F. A. DOUGLAS.

THERE is romance and beauty as well as utility in seaweed; its capture often leads to high adventure, and its harvesting is reminiscent of fresh salt breezes, wild and lonely shores, and many strange, decaying, but interesting industries.

Most wonderful of all is the Sargasso Sea, where the weed grows in such rich abundance that Columbus was entangled and involved in it for about a fortnight. Humboldt the traveller refers to it as 'that great bank of weeds which so vividly occupied the imagination of Christopher Columbus, and which Oviedo calls the seaweed meadows.' These particular seaweeds are called

'gulf-weed,' and are used in the East for pickling and as salads. Quite recently a writer referred to this store of food, and maintained that in these seaweeds were to be found as much proteid as in all the big American wheatfields.

Of course the seaweed dishes are the birds'-nest dishes prepared by the Chinese. These may be had in various Chinese restaurants in London, and are decidedly expensive. In the Indian Archipelago the sea-birds build their nests of a very fine white seaweed. The nests are perched high up in caverns and on cliffs. Experienced cliff-climbers go up long bamboo ladders and bring them down, and explore the

darker caverns by torchlight. The best nests are those ready for, but unused by, the birdlings, for, of course, they are the cleanest; and so, to gratify the fancies of gourmets, the dainty little homes prepared by the parents for their nestlings are stolen from them.

A seaweed that had a high reputation a generation or more ago is Irish or Carrageen moss. A Dublin doctor loudly proclaimed its value as a food for consumptives, and it certainly made a very nutritious and digestible jelly. An ounce of it was soaked in a pint of water for four hours, and a pint of milk was added. It was then boiled, sweetened, and flavoured, and set to cool. Combined with sugar, treacle, ginger, and hops, Irish moss was also used to make beer. There is an article on 'Carrageen,' with recipes, in this *Journal* for 1907. The 'moss' is found plentifully on the Irish coast, in lesser quantities on the west coast of Ross-shire and the Hebrides, and in many parts of northern Europe.

A very considerable seaweed industry is the gathering of laver on the coast of Pembrokeshire. The laver-gatherers camp out in huts made of driftwood and thatched with coarse grass from the dunes. They collect and dry the laver, and send it to the Swansea market. It is sold in the west end of London as a delicacy in winter. It is purple when fresh, but black when you buy it, and something like thin liquorice to look at. It can be made into little rolls, dusted with oatmeal, and fried. Pickled with pepper and vinegar and oil, or with lemon-juice, it is excellent. It is akin to Irish moss, and is good for scrofulous people; both owe their virtues to the iodine they contain. Southey loved laver, and was greatly pleased when he got a present of it.

Very familiar to all Scots people are dulse and tangle—two of the best-known edible seaweeds. Dulse and sandhoppers (a species of small shrimp) are a special joy, and the more recent the decease of the sandhoppers the better the dish. Roasted dulse is considered equal to oysters. Dulse has really been found a very valuable food in the North, and the Icelanders boil it in milk, and salt it down in casks for winter use. In the 'Isles of Greece' it is considered a delicacy, and in Kamchatka people ferment it and make a drink of it.

Tangle, or 'tankle,' is a well-known old-fashioned Edinburgh dainty. The young stalks are very gelatinous and nutritious, and the old stalks make very good knife-handles. Stick the blade of the knife in the stalk when it is wet, and when dry it is quite hard and firm.

The quality of gelatinousness runs through many seaweeds, and quite a variety of foreign species are used to make jellies. *Gracilaria* is pickled and preserved, and Badderlocks is a weed whose midribs form a useful food on the Norwegian and Danish coasts.

The main chemical products of seaweeds, manufactured as kelp, are iodine and potash.

It was on the wild shores of Bœotia that shipwrecked mariners, burning seaweed, first discovered kelp; and from kelp are got valuable alkalines, such as potash. It takes twenty tons of seaweed to produce one ton of kelp, and from a ton of kelp eight pounds of iodine can be obtained. Brittany and Guernsey produce more kelp than Britain. Iodine was only discovered in 1811 by a French chemist.

From a pamphlet issued by the Imperial Institute on 'The World's Supply of Potash,' we obtain interesting particulars of the ancient Scottish kelp industry. Its home lay chiefly in the Orkneys and the Outer Hebrides, and it owed its virtue to the storms that beat about their shores. At first the kelp was extracted from two species of *Fucus* and one of *Ascophyllum*, easily gathered at low tide. These, however, were found to be deficient in iodine; and, later, weeds of the deeper sea, *Laminaria digitata* and *stenophylla*, were discovered to be much richer in results. In wild and stormy weather these are cast upon the shore in great abundance, and the industry continued to thrive and improve. Singularly enough, the *Laminarias* are most easily obtained in summer, and a certain business is done in the more easily gathered and less valuable weeds in winter. The weed is carted from the shore to the machairs of the farm and laid out to dry. In favourable weather it dries in two days, and is ready in three days to burn in open shallow kilns, with brick or stonework sides. The decay of this industry was owing to the increasing imports of German potash salts, particularly from the Stassfurt mines, and now that they are cut off it seems an excellent time to revive and increase this homely old native industry.

In the United States for some time past considerable attention has been paid to obtaining potash from seaweeds. It was recently announced that the kelp-crop of the Pacific Ocean is to be harvested by a powder company to obtain an ingredient used in making ammunition for the warring nations of Europe. One of the largest manufacturers of powder in the United States has decided to spend a large sum in this enterprise in order to obtain potassium chloride required to fill war orders, as it can no longer be obtained from Germany. It has been long known that kelp, such as is to be found along the shores of the Californian coast, is rich in potash. A submarine reaper has been designed which will cut the kelp in six-inch lengths. These will be sucked by a pump into a big wire basket. The pieces of kelp are then to be taken ashore and placed in roasting-vats, the needed chemical substances being afterwards extracted.

In Ireland, under the superintendence and advice of the very active Board of Agriculture there, steps have been taken to encourage the growth of seaweeds on the shores. Additional rocks and stones are placed upon the sands, and

these catch and retain the weeds cast up by the tides. Stones are even taken out in boats and thrown into shallow water. Sometimes the stones are placed in regular lines and enclose rectangular beds where seaweeds may grow. The weed is cut every second year and used as manure by the farmers. If the stones sink into the mud or sand, they are raised again by means of crowbars.

As a manure seaweed is indeed immensely valuable, and every seaside farmer should have a seaweed farm. *Fucus*, weight for weight, is considered quite equal to farmyard manure. It is particularly good for enabling light and sandy soils to endure prolonged drought. Cabbages and mangolds benefit by sea-manure; and in this connection we may remind our readers that many of our most valuable vegetables have been developed from maritime plants.

The Japanese, a very enterprising and wide-awake people, have also realised the value of seaweed, and have set to work to cultivate it. They, like the Chinese, are very fond of the birds'-nest seaweed dishes.

A curious and interesting use of seaweed came to light a few years ago through the exposure of a local squabble in a London news-

paper. It appeared that on the Kentish shores of the Thames estuary a very fine white seaweed was collected and sold to London and Paris milliners as a trimming for ladies' hats. Essex trawlers, however, discovering this, attached barbed wire to their trawls and carried away much of this weed in an immature and less valuable condition, and sold it to German agents at a low figure. The Kentish seaweed-gatherers were indignant, for, owing to this rough method of collection, the seaweed was being destroyed altogether. Their industry, we are pleased to say, finally obtained protection; but it was curious to find the trail of the underselling German even here.

A very interesting seaweed is coralline, which has hard tips containing lime. With these tips and other lime obtained from sea-shells, mixed with gravel, St Columba formed a strong cement with which he welded the walls of the famous cathedral of Iona.

So in Scotland valuable seaweeds fringe the shores, feed the people, manure their lands, and supply them with means of earning a living; and it is, above all, built into the most interesting monument of olden times that they possess.

LYNCH-LAW.

IN *Chambers's Journal* of May last Mr A. G. Bradley gives a current American version of the origin of the phrase 'lynch-law,' and notes one common American variant, but he ignores the older and more romantic story to which the term is sometimes traced. This goes back to the year 1493, and belongs, as does, indirectly, Mr Bradley's, to the city of Galway.

Although three hundred years and as many thousand miles divide the two stories, there are some curious coincidences between them. In each we find 'the degenerate son of a worthy sire,' the attempt to defraud justice of its due by friends of the prisoner, and the family name of Lynch of Galway. In the Irish story, as we shall see, we are concerned with a legal, if irregular, execution; with a defiance of the mob and not a humouring of its passions.

In Mr Bradley's narrative the connection between an honoured family name and capital punishment inflicted by mob-law is the merest accident, due to the fact that the victim was taken to his doom from a Virginian court-house jail, used a century before by a Judge Charles Lynch, a Galway Quaker who had settled in Virginia. Judge Lynch in person had nothing to do with the case, which, according to Mr Bradley's version, gave the judge's name to the law. This in itself throws some doubt upon his explanation, as it does not seem likely that the name 'lynch-law' would be applied to the

removal of a prisoner from a jail once connected with a famous judge and his execution by the mob. Other American versions which connect the act more immediately with the man are inherently more probable.

The old traditional Galway story is a story of father and son. Hardiman, the Galway annalist, narrates it in order, as he says, to prove 'the unsullied honour, the strict adherence to truth, and love of impartial justice' which proverbially distinguish the fortunate inhabitants of Galway. As will be seen from the story which follows, Hardiman's heart is more generous than his head is logical, for what he calls 'an appalling instance of inflexible justice' occurred in opposition to the wishes of the townsfolk whose love of justice he praises.

The mayor of Galway in 1493 was one James Lynch Fitz-Stephen, a worthy representative of the Tribes of Galway, as the descendants of the first Anglo-Norman settlers have ever since been called. The mayor's only son, Walter, was wild and dissipated. In those days Galway was not as it is to-day, a city of memories, but one of the chief ports of the three kingdoms, possessing an extensive trade, especially with Spain. So important was Galway in those golden days that, as the old historian Heylin tells us, a foreigner once asked an Irishman to tell him in what part of Galway Ireland was situated.

Fitz-Stephen, the mayor, had made a fortune

by trading with Spain, and going there in person to consolidate this trade, he was entertained most hospitably at the house of a rich merchant of Cadiz, named Gomez. On leaving he offered in return to take back with him to Galway to finish his education the nineteen-year-old son of his Spanish host. This boy, so the story goes, was of a most lovable disposition, and Fitz-Stephen may perhaps have hoped that companionship with this young Gomez might do something toward reclaiming his own wild son Walter. At all events, young Gomez in an evil hour sailed back with the mayor of Galway, and was lodged safely in the mayoral house.

Walter, to the father's delight, was now apparently beginning to settle down, as a result of his falling in love with Agnes, the daughter of a neighbour. The two young men had struck up a warm friendship, and Walter took the young Spaniard everywhere. As Galway has been famous for its hospitality all the world over, we may be sure that Gomez received a royal welcome on all sides. In any case, a distinguished young foreigner with plenty of money, and handsome to boot, the guest of the chief-magistrate, has rarely had to complain in any city at any age of the coldness of heads of houses. Galway took its Gomez to its bosom. Walter rejoiced at this, until he fancied that Agnes was prepared to follow the example of her native city. This may have been only his jealous fancy, or rather, knowing Irish ladies as we do, must have been; but whatever the truth of the matter might be, he could not control his fury, and falling suddenly upon his Spanish rival, he poniarded him and threw his body into the sea.

Evidence was quickly forthcoming as to the perpetrator of the deed. The son was promptly arrested and brought before his own father, who, like Lucius Junius Brutus of old, condemned him as promptly to death.

The ancient city of Galway has always been famous for its sympathy with the unfortunate. Like Portia, it has ever thought it best when mercy seasons justice. To-day even there is a proverb that the safest place in Galway is the prisoners' dock. The ancient city then was stirred to its depths by the horror of a father's sentencing his only son to death. Walter, the son, was widely popular, as are so often the scapegrace sons of grave and reverend seigniors. The victim, though otherwise a good man, did not belong to Galway. Walter's mother, a lady of the house of Blake, having in vain, we may suppose, appealed to her stern husband for mercy, stirred up her powerful kinsmen to rescue her son from his fate. Soon a mob assembled round the mayor's house, bent on rescuing the son from the father. But it had not reckoned with the proverbial determination of a Lynch.

The father, so runs the tradition, went down to his son's cell and warned him to prepare for

death. Then, putting a rope round the boy's neck, he led him up to a large first-storey window of his house. Here he made taut the rope to a stanchion, and hurled his son's body from the window into the faces of an infuriated mob.

Such is the Galway story of the origin of 'lynch-law.' The window is shown to this day—which ought to be proof enough to the most sceptical—and under the lintel you will find this legend: 'This memorial of the stern and unbending justice of the chief-magistrate of the city, James Lynch Fitz-Stephen, elected mayor A.D. 1493, who condemned and executed his own guilty son, Walter, on this spot, has been restored to its ancient site.' Underneath this is a stone with skull and cross-bones, and the inscription:

1524.

REMEMBER DEATHE. VANITI OF VANITIS.

AND AL IS BUT VANITI.

The Irish story is more romantic than the American, yet there is little doubt that the verb 'to lynch' and the phrase 'lynch-law' come from across the Atlantic.

In the first place, the victim in the Galway story was not 'lynched,' but executed legally by a judge, whereas the term 'to lynch' has always been applied to mob-law. As an old man in Galway put it, 'The father saved the boy from rescue by an infuriated mob by hanging him himself.' In the second place, the use of the word in this special sense is modern, and sprang up originally in America to meet a want in the language, although the thing itself is, of course, universal. We may suspect, I think with reason, the various American stories, which profess to derive the word from some Judge Lynch, if we remember that there is a good English provincialism, 'to lynch, linse, or lynch,' meaning 'to beat,' and that the phrase 'club-law' means much the same as 'lynch-law.' 'To lynch' would not be the first English provincialism to survive with an extended meaning amongst our American cousins.

SONNET.

THERE is an hour, late in the silent night,
When every bond of day may loose its hold,
And thou, my heart, mayst tremblingly unfold
Long-fettered pinions for a stolen flight.
Oh weary one, they are not all so bright,
The lands thou seek'st, the memories of old;
Yet is there never one so dark and cold
That has no star to cheer thee with its light.
Fly back at will, the eyes of some dear friend
Shall welcome thee. My heart, ah, let us own
Our debt to Heaven for the deep strength they
lend,
The noble, good, and true that we have known.
And is there one, dearer than all, more fair?
To think of her, be that our purest prayer.

NEIL E. MACLEOD.

Chambers's Journal

SEVENTH SERIES

THE RUSSIAN PARLIAMENT.

By ROBERT MACHRAY.

RUSSIA, which has been defined, paradoxically yet more or less accurately, by the *Almanach de Gotha* as 'a constitutional monarchy under an autocracy,' began to have a Parliament only some ten years ago, the Duma being brought into existence by the fiat of the present Czar in 1905. In other lands it is rather the custom nowadays to speak of the Duma as if it were the sole Russian parliamentary body; but in reality it is the Lower House, the Upper consisting of the Council of the Empire. The Duma, however, is by far the more popularly representative institution, as all its members are elected; and this fact has given it a prestige, particularly outside Russia, not possessed by the Council, half of which is nominated by the Throne, and therefore it does not reflect the independent opinion of the country in an equal degree. The Council is nearly a century older than the Duma, but was not accorded a parliamentary status till 1906, the year in which the first Duma met. Both chambers have much the same rank; legislation can be initiated in either, and all measures must be passed by both before they can be sent up to the Czar for his sanction or the reverse. As might be expected from its composition, it is the Duma that takes the lead; and, though its brief history has been chequered, its power is undoubtedly increasing, thus opening up a prospect that the ideal of a free Russia, under a genuinely constitutional régime, may before long be realised.

Before long! Yes, but not too soon. Russia is developing politically, but her circumstances are such that that development cannot with advantage be rapid. A great many people seem to think of Russian political life, past and present, in a way which recalls to me one of Robert Louis Stevenson's inimitable passages. That which I have in mind occurs in *Weir of Hermiston*. Describing the judge's wife's idea of the Covenanters and their opponents, he wrote: 'Her view of history was wholly artless, a design in snow and ink: upon the one side, tender innocents with psalms upon their lips; upon the other, the persecutors, booted, bloody-minded, flushed with wine—a suffering Christ, a raging Beelzebub.' Similarly, those to whom I refer put the Czar, his Ministers, and the Russian officials on one side, and place on the

other the vast masses of the Russian people, the former being represented as cruel and tyrannical, and the latter as down-trodden and oppressed. Whether this picture was ever absolutely true to life in the past may be questioned; but it certainly is not justified to-day. The truth is that the political problem of Russia is a difficult one, which can be solved but slowly. The empire has a population of nearly one hundred and eighty millions, scattered over a perfectly enormous area, and embraces upwards of twenty different nations and races, among whom are many millions of Mohammedans. The great majority of Russians are peasants, and about 80 per cent. of the whole people are illiterate. An instructed and fairly rich middle-class is of recent growth, as are the working-classes, a large proportion of whom are educated only a little better than the tillers of the soil, the rest being quite as ignorant. Such facts go to show that there is nothing simple, nothing easy, in this problem, and that its solution can come about only gradually, if the interests of the country generally are duly taken into account. It is essentially a matter for wise statesmanship—which, however, has not, it must be confessed, always been exercised, periods of reaction alternating with periods of progress; yet a decided advance has been made.

It was in a time of stress, internal as well as external, that the Duma was born. While Russia's disastrous war with Japan was still going on in Manchuria there arose within Russia a violent political agitation—engineered by revolutionists, most of whom were university students and workmen—which was marked by serious strikes in Petrograd and other cities, riots in several towns, disturbances in the country districts, and seditious movements among the soldiers. So threatening was the aspect of affairs that it looked as if the czardom and the Government might be swept away; but the more moderate elements, dissatisfied, yet not prepared to support so thorough a revolution, called for the convocation of a Constituent Assembly, to which the Government should be responsible. The Government, which proved to be much less weak than it seemed, acted with vigour, ended the strikes by force, and obtained control of the situation. Public opinion, how-

ever, continued urgently to demand a Parliament, and the Czar agreed to the establishment of a consultative Chamber of Deputies, to which the name Duma was given. On 19th August 1905 he issued a manifesto to his people, in which he ordained the formation of this institution, declaring it was to be representative, and that its function was to 'take a constant and active share in the elaboration of laws.' This did not satisfy the malcontents; the revolutionary agitation broke out afresh and with increased virulence; the Government bent before the storm, and on 30th October 1905 the Czar signed a Constitution. One of the two strongest parties in the Duma of to-day takes its name from the date of this document, and the platform of the 'Octobrists' rests upon the principles enunciated therein. Besides granting liberty of conscience, speech, assembly, and association, the Constitution provided that no law should come into force without the approval of the Duma, which also was given a real participation in the supervision of the acts of the authorities appointed by the Czar.

In a word, the Constitution 'Liberalised' Russia, but, as events subsequently showed, more in seeming than in reality; for, though it survives as an inspiration and as an ideal which one day will be attained, its provisions still remain unfulfilled. A calm, unprejudiced observer of the Russia of that time can hardly help taking the view that the country was not ripe for the successful operation of this Constitution. The many millions of peasants were certainly not ready for anything of the sort, nor were the working-classes sufficiently educated to make good use of it. The working-classes, the phrase being employed in its general Western signification, were almost a new feature of Russia. It was only toward the close of last century that, thanks to the efforts of Count Witte and the influx of French capital, the empire enjoyed any considerable industrial development. Of course, as various industries sprang up and grew they gathered around them the necessary 'hands,' who in the aggregate were a large number. Naturally the working-classes were concentrated in the towns; they were less passive than the peasants, and much more open to Socialist and other revolutionary suggestion, but comparatively few of them were advanced enough in knowledge to have any real understanding of politics. It must be remembered that, apart from the aristocracy, bureaucracy, the professional classes, the captains of industry, and the great merchants, the Russian people as a whole were nearly in as backward a state as they had been a hundred years before. Several months passed between the promulgation of the Constitution and the assembling of the Duma, which took place on 10th May 1906. In the interval political parties took shape, their complexion not differing very greatly from that

found in other countries—extremists on the wings, so to speak, and all shades of moderate opinion in between.

In the first Duma the party called the Constitutional Democrats or 'Cadets' had a large majority. The name cadets came from the party initials K—Russia spells constitution with a k—and D. The programme of the party, which was composed of Radicals rather than revolutionists, was far too extensive and contentious to be practical politics at such a time. It included universal suffrage, a purely parliamentary Government, the expropriation of the landlords, and the abolition of capital punishment. It also demanded the suppression of the Council of the Empire, which shortly before had been transformed into the Upper House of Parliament, doubtless with the object of providing a check on the Duma. The mere recitation of these items of its programme, one or two of which might well have occupied successive Dumas for a considerable period, is almost enough to explain the short life of the first Duma. The Cadets pressed their proposals with the utmost vehemence, and would entertain no others, with the result that the Czar dissolved the Duma on 7th July, after it had sat for not quite sixty days. The Cadet leaders withdrew to Finland, whence they issued a manifesto to the Russian people, exhorting them to refuse to perform military service or to pay taxes; but this appeal failed. The second Duma, whose term lasted about a week longer than that of the first, met on 5th March 1907; but the same party, which continued to have a majority, put forward a programme more impossible than before, and the Czar closed this Duma on 16th June of the same year. He did more. To render his Parliament not quite so progressive, he cut down the number of deputies from five hundred and twenty-four to four hundred and forty-two, and ordered that they should be elected by delegates chosen by the zemstvos, or local elective assemblies. The third Duma assembled on 1st November 1907; and, though the party of the Right and Conservatives generally preponderated, there was a sufficient representation of other political elements to make this Parliament fairly good. It established peasant proprietorships, did something toward securing religious freedom, and enacted other useful measures during the five years of its existence.

It is of the fourth Duma, which was elected in September 1912, and which has been sitting, with intervals of adjournment, like the third Duma, for some three years, that we read in our papers at the present time. It is composed of about a dozen parties or political groups, the most numerous of which are the Nationalists (or party of the 'country gentlemen') and the Octobrists, each of these having some ninety members; the Cadets number about sixty; and

the Progressives forty; the Poles count fourteen votes; the extreme Right, the party identified with reaction, is much stronger than the extreme Left, which is Socialist, ultra-democratic, and opposed to the czarism; the remaining groups are insignificant.

Before the war broke out in 1914 there was considerable friction between the Government, which is appointed by the Czar and is responsible to him alone, and the Duma. The latter in 1913 passed a motion to the effect that the Government and the legislative assemblies should co-operate to realise the principles of the Czar's manifesto of October 1905, and resolutions were adopted condemning the Minister of the Interior, and adversely criticising the educational policy of the Minister of Public Instruction.

The war changed everything, at any rate for a time. When the struggle was beginning the Czar issued a manifesto in which he said: 'In the dread hour of trial let intestine dissensions be forgotten in order that the union of the Czar and his people may be more fully consolidated, and that Russia, rising as one man, may repulse the insolent attack of the enemy.' On 8th August 1914 he received the members of the two Houses at the Winter Palace, and in an eloquent speech declared he was confident that every one of them, irrespective of party, would support him in carrying on the war to a victorious conclusion. His moving words did not fail of their purpose. In a scene of patriotic fervour the leaders of the various parties announced that they would do everything in their power to help him. The occasion was most memorable, for in that hour political enmities and jealousies absolutely disappeared, and when the Duma reassembled it worked with a unanimity which had never characterised it before.

But the Duma had really very little to do with the conduct of the war; that was almost entirely in the hands of the Government and Government officials of various kinds—in other

words, the bureaucrats, the majority of whom have no love for the Duma, and would like to see it abolished. So long as things went well for Russia in the field the bureaucrats had it all their own way; but when the Russian armies in May 1915 were driven by the Austro-Germans under Mackensen from the Dunajec to the San, had to retire from the Carpathians, and withdrew east of the Nida, it was a very different matter. The Duma was not sitting at the time; but all Russia asked what was the secret of the failure of their armies in Galicia, and then it came out that the bureaucrats were guilty of not having maintained an adequate supply of munitions. Instantly there was a perfect explosion of angry opinion among the professional and commercial classes throughout the empire, and an urgent demand for a change in the management of the war was made on all hands. So tremendous was the outcry that several obnoxious Ministers were replaced by others who favoured reform, the most notable change being that of General Polivanoff, a Progressive, for General Sukhomlinoff, at the head of the Ministry of War. The Duma resumed in August, passed a Bill for the formation of a Board of Munitions, on which it and the Council were each to have nine representatives, and demanded that legal proceedings should be taken forthwith against all, irrespective of position in the State, who were responsible for the shortage of guns and shells that had brought about the disasters in Galicia and Poland. It spoke with conspicuous freedom of the shortcomings of the Government in various departments; but its voice was unanimous for prosecuting the war to a triumphant finish. The politicians, however, were not content until they introduced some of the old highly controversial matters. The Czar, saying it was not a suitable time for such discussions, exhorted them to lay aside every preoccupation and concentrate all their thoughts on the war. He then adjourned his Parliament to November.

THE DAY OF WRATH.

CHAPTER I.—*continued.*

DURING five long minutes Dalroy reviewed the situation. Probably he would be executed as a spy. At best, he could not avoid internment in a fortress till the end of the war. He preferred to die in a struggle for life and liberty. Men had escaped in conditions quite as desperate. Why not he? The surge of impotent anger subsided in his veins, and he took thought.

Outside the open door stood the sentry, holding his rifle, with fixed bayonet, in the attitude of a sportsman who expects a covey of partridges to rise from the stubble. A window

of plain glass gave on to the platform. Seemingly it had not been opened since the station was built. Three windows of frosted glass in the opposite wall were, to all appearance, practicable. Judging by the sounds, the station square lay without. Was there a lock and key on the door? Or a bolt? He could not tell from his present position. The sentry had orders to kill him if he moved. Perhaps the man would not interpret the command literally. At any rate, that was a risk he must take. With head sunk and hands behind his back, obviously in a state of deep dejection, he began to stroll to and fro.

Well, he had a fighting chance. He was not shot forthwith.

A slight commotion on the platform caught his eye, the sentry's as well. A tall young officer, wearing a silver helmet, and accompanied by a glittering staff, clanked past; with him the lieutenant of reserves, gesticulating. Dalroy recognised one of the Emperor's sons; but the sentry had probably never seen the princeling before, and was agape. And there was not only a key but a bolt!

With three noiseless strides Dalroy was at the door and had slammed it. The key turned easily, and the bolt shot home. Then he raced to the middle window, unfastened the hasp, and raised the lower sash. He counted on the thick-headed sentry wasting some precious seconds in trying to force the door, and he was right. As it happened, before the man thought of looking in through the platform window Dalroy had not only lowered the other window behind him, but dropped from the sill to the pavement between the wall and a covered van which stood there.

Now he was free—free as any Briton could be deemed free in Aix-la-Chapelle at that hour, one man among three army corps, an unarmed Englishman among a bitterly hostile population which recked naught of France or Belgium or Russia, but hated Britain already with an almost maniacal malevolence.

And Irene Beresford, that sweet-voiced, sweet-faced English girl, was a prisoner at the mercy of a 'big blonde brute,' a half-drunken, wholly enraged Prussian Junker. The thought rankled and stung. It was not to be borne. For the first time that night Dalroy knew what fear was, and in a girl's behalf, not in his own.

Could he save her? Heaven had befriended him thus far; would a kindly Providence clear his brain and nerve his spirit to achieve an almost impossible rescue?

The prayer was formless and unspoken, yet it was answered. He had barely gathered his wits after that long drop of nearly twelve feet into the station yard before he was given a vague glimpse of a means of delivering the girl from her immediate peril.

CHAPTER II.—IN THE VORTEX.

THE van, one among a score of similar vehicles, was backed against the kerb of a raised path. At the instant Dalroy quitted the window-ledge a railway employé appeared from behind another van on the left, and was clearly bewildered by seeing a well-dressed man springing from such an unusual and precarious perch.

The new-comer, a big, burly fellow, who wore a peaked and lettered cap, a blouse, baggy breeches, and sabots, and carried a lighted hand-lamp, looked what, in fact, he was—an engine-cleaner. In all likelihood he guessed that any one choosing such a curious exit from a waiting-

room was avoiding official scrutiny. He hurried forward at once, holding the lamp above his head, because it was dark behind the row of vans.

'Hi, there!' he cried. 'A word with you, *Freiherr!*' The title, of course, was a bit of German humour. Obviously he was bent on investigating matters. Dalroy did not run. In the street without he heard the tramp of marching troops, the jolting of wagons, the clatter of horses. He knew that a hue and cry could have only one result—he would be pulled down by a score of hands. Moreover, with the sight of that suspicious Teuton face, its customary boorish leer now replaced by a surly inquisitiveness, came the first glimmer of a fantastically daring way of rescuing Irene Beresford.

He advanced, smiling pleasantly. 'It's all right, Heinrich,' he said. 'I've arrived by train from Berlin, and the station was crowded. Being an acrobat, I took a bounce. What?'

The engine-cleaner was not a quick-witted person. He scowled, but allowed Dalroy to come near—too near.

'I believe you're a *verdammte Engl!*'—he began.

But the popular German description of a Briton died on his lips, because Dalroy put a good deal of science and no small leaven of brute force into a straight punch which reached that cluster of nerves known to pugilism as 'the point.' The German fell as though he had been pole-axed, and his thick skull rattled on the pavement.

Dalroy grabbed the lamp before the oil could gush out, placed it upright on the ground, and divested the man of blouse, baggy breeches, and sabots. Luckily, since every second was precious, he found that he was able to wedge his boots into the sabots, which he could not have kept on his feet otherwise. His training as a soldier had taught him the exceeding value of our Fifth Henry's advice to the English army gathered before Harfleur:

In peace there's nothing so becomes a man
As modest stillness and humility;
But when the blast of war blows in our ears,
Then imitate the action of the tiger.

The warring tiger does not move slowly. Half-a-minute after his would-be captor had crashed headlong to the hard cobbles of Aix-la-Chapelle, Dalroy was creeping between two wagons, completing a hasty toilet by tearing off collar and tie, and smearing his face and hands with oil and grease from lamp and cap. Even as he went he heard a window of the waiting-room being flung open, and the excited cries which announced the discovery of a half-naked body lying beneath in the gloom.

He saw now that to every van was harnessed a pair of horses, their heads deep in nose-bags, while men in the uniform of the Commissariat Corps were grouped around an officer who

was reading orders. The vans were sheeted in black tarpaulins. With German attention to detail, their destination, contents, and particular allotment were stencilled on the covers in white paint: 'Liège, baggage and fodder, cavalry division, 7th Army Corps.' He learnt subsequently that this definite legend appeared on front and rear and on both sides.

Thinking quickly, he decided that the burly person whose outer garments he was now wearing had probably been taking a short cut to the station entrance when he received the surprise of his life. Somewhat higher up on the right, therefore, Dalroy went back to the narrow pavement close to the wall, and saw some soldiers coming through a doorway a little ahead. He made for this, growled a husky 'Good-morning' to a sentry stationed there, entered, and mounted a staircase. Soon he found himself on the main platform; he actually passed a sergeant and some Bavarian soldiers, bent on recapturing the escaped prisoner, rushing wildly for the same stairs.

None paid heed to him as he lumbered along, swinging the lamp.

A small crowd of officers, among them the youthful prince in the silver *Pickel-haube*, had collected near the broken window and now open door of the waiting-room from which the 'spy' had vanished. Within was the fat lieutenant of reserves, gesticulating violently at a pallid sentry.

The prince was laughing. 'He can't get away,' he was saying. 'A bold rascal. He must be quieted with a bayonet-thrust. That's the best way to inoculate an Englishman with German *Kultur*.'

Of course this stroke of rare wit evoked much mirth. Meanwhile Dalroy was turning the key in the lock which held Irene Beresford in safe keeping until Von Halwig had discharged certain pressing duties as a staff officer.

The girl, who was seated, gave him a terrified glance when he entered, but dropped her eyes immediately until she became aware that this rough-looking visitor was altering the key. Dalroy then realised by her startled movement that his appearance had brought fresh terror to an already overburdened heart. Hitherto, so absorbed was he in his project, he had not given a thought to the fact that he would offer a sinister apparition.

'Don't scream or change your position, Miss Beresford,' he said quietly in English. 'It is I, Captain Dalroy. We have a chance of escape. Will you take the risk?'

The answer came, brokenly it is true, but with the girl's very soul in the words. 'Thank God!' she murmured. 'Risk? I would sacrifice ten lives, if I had them, rather than remain here.'

Somehow, that was the sort of answer Dalroy expected from her. She sought no explanation

of his bizarre and extraordinary garb. It was all-sufficient for her that he should have come back. She trusted him implicitly, and the low, earnest words thrilled him to the core.

He saw through the window that no one was paying any attention to this apartment. Possibly the only people who knew that it contained an Englishwoman as a prisoner were Von Halwig and the infuriated lieutenant of reserves.

Jumping on to a chair, Dalroy promptly twisted an electric bulb out of its socket, and plunged the room in semi-darkness, which he increased by hiding the hand-lamp in the folds of his blouse. Given time, no doubt, a dim light would be borrowed from the platform and the windows overlooking the square; in the sudden gloom, however, the two could hardly distinguish each other.

'I have contrived to escape, in a sense,' said Dalroy; 'but I could not bear the notion of leaving you to your fate. You can either stop here and take your chance, or come with me. If we are caught together a second time these brutes will show you no mercy. On the other hand, by remaining, you may be fairly well treated, and even sent home soon.'

He deemed himself in honour bound to put what seemed then a reasonable alternative before her. He did truly believe, in that hour, that Germany might, indeed, wage war inflexibly, but with clean hands, as befitted a nation which prided itself on its ideals and warrior spirit. He was destined soon to be enlightened as to the true significance of the *Kultur* which a jack-boot philosophy offers to the rest of the world.

But Irene Beresford's womanly intuition did not err. One baleful gleam from Von Halwig's eyes had given her a glimpse of infernal depths to which Dalroy was blind as yet. 'Not only will I come with you; but, if you have a pistol or a knife, I implore you to kill me before I am captured again,' she said.

Here, then, was no waste of words, but rather the ring of finely tempered steel. Dalroy unlocked the door and looked out. To the right and in front the platform was nearly empty. On the left the group of officers was crowding into the waiting-room, since some hint of unfathomable mystery had been wafted up from the Bavarians in the courtyard, and the slim young prince, curious as a street loungeur, had gone to the window to investigate.

Dalroy stood in the doorway. 'Pull down your veil, turn to the right, and keep close to the wall,' he said. 'Don't run! Don't even hurry! If I seem to lag behind, speak sharply to me in German.'

She obeyed without hesitation. They had reached the end of the covered-in portion of the station, when a sentry barred the way. He brought his rifle with fixed bayonet to the 'engage.'

'It is forbidden,' he said.

'What is forbidden?' grinned Dalroy amiably, clipping his syllables, and speaking in the roughest voice he could assume.

'You cannot pass this way.'

'Good! Then I can go home to bed. That will be better than cleaning engines.'

Fortunately a Bavarian regiment was detailed for duty at Aix-la-Chapelle that night; the sentry knew where the engine-sheds were situated no more than Dalroy. Further, he was not familiar with the Aachen accent.

'Oh, is that it?' he inquired.

'Yes. Look at my cap!'

Dalroy held up the lantern. The official lettering was evidently convincing.

'But what about the lady?'

'She's my wife. If you're here in half-an-hour she'll bring you some coffee. One doesn't leave a young wife at home with so many soldiers about.'

'If you both stand chattering here neither of you will get any coffee,' put in Irene emphatically.

The Bavarian lowered his rifle. 'I'm relieved at two o'clock,' he said with a laugh. 'Lose no time, *schöne Frau*. There won't be much coffee on the road to Liège.'

The girl passed on, but Dalroy lingered. 'Is that where you're going?' he asked.

'Yes. We're due in Paris in three weeks.'

'Lucky dog!'

'Hans, are you coming, or shall I go on alone?' demanded Irene.

'Farewell, comrade, for a little ten minutes,' growled Dalroy, and he followed.

An empty train stood in a bay on the right, and Dalroy espied a window-cleaner's ladder in a corner. 'Where are you going, woman?' he cried.

His 'wife' was walking down the main platform, which ended against the wall of a signal-cabin, and there might be insuperable difficulties in that direction.

'Isn't this the easiest way?' she snapped.

'Yes, if you want to get run over.'

Without waiting for her, he turned, shouldered the ladder, and made for a platform on the inner side of the bay. A ten-foot wall indicated the station's boundary. Irene ran after him. Within a few yards they were hidden by the train from the sentry's sight.

'That was clever of you!' she whispered breathlessly.

'Speak German, even when you think we are alone,' he commanded.

The platform curved sharply, and the train was a long one. When they neared the engine they saw three men standing there. Dalroy at once wrapped the lamp in a fold of his blouse, and leaped into the black shadow cast by the wall, which lay athwart the flood of moonlight pouring into the open part of the station. Quick to take the cue, it being suicidal to think of bamboozling local railway officials, Irene followed.

Kicking off the clumsy sabots, Dalroy bade his companion pick them up, ran back some thirty yards, and placed the ladder against the wall. Mounting swiftly, he found, to his great relief, that some sheds with low-pitched roofs were ranged beneath; otherwise the height of the wall, if added to the elevation of the station generally above the external ground-level, might well have proved disastrous.

'Up you come,' he said, seating himself astride the coping-stones, and holding the top of the ladder.

Irene was soon perched there too. He pulled up the ladder, and lowered it to a roof.

'Now, you grab hard in case it slips,' he said.

Disdaining the rungs, he slid down. He had hardly gathered his poise before the girl tumbled into his arms, one of the heavy wooden shoes she was carrying giving him a smart tap on the head.

'These men!' she gasped. 'They saw me, and shouted.'

Dalroy imagined that the trio near the engine must have noted the swinging lantern and its sudden disappearance. With the instant decision born of polo and pig-sticking in India, he elected now not to essay the slanting roof just where they stood. Shouldering the ladder again, he made off toward a strip of shadow which seemed to indicate the end of a somewhat higher shed. He was right. Irene followed, and they crouched there in panting silence.

Nearly every German is a gymnast, and it was no surprise to Dalroy when one of their pursuers mounted on the shoulders of a friend and gained the top of the wall.

'There's nothing to be seen here,' he announced after a brief survey.

The pair beneath must have answered, because he went on, evidently in reply, 'Oh, I saw it myself. And I'm sure there was some one up here. There's a sentry on No. 5. Run, Fritz, and ask him if a man with a lantern has passed recently. I'll mount guard till you return.'

Happily a train approached, and in the resultant din Dalroy was enabled to scramble down the roof unheard.

The ladder just reached the ground; so, before Fritz and the sentry began to suspect that some trickery was afoot in that part of the station, the two fugitives were speeding through a dark lane hemmed in by warehouses. At the first opportunity Dalroy extinguished the lantern. Then he bethought him of his companion's appearance. He halted suddenly ere they entered a lighted thoroughfare.

'I had better put on these clogs again,' he said. 'But what about you? It will never do for a lady in smart attire to be seen walking through the streets with a ruffian like me at one o'clock in the morning.'

For answer, the girl took off her hat and tore

away a cluster of roses and a coquettish bow of ribbon. Then she discarded her jacket, which she adjusted loosely across her shoulders.

'Now I ought to look raffish enough for anything,' she said cheerfully.

Singularly enough, her confidence raised again in Dalroy's mind a lurking doubt which the success thus far achieved had not wholly stilled.

'My candid advice to you now, Miss Beresford, is that you leave me,' he said. 'You will come to no harm in the main streets, and you speak German so well that you should have little difficulty in reaching the Dutch frontier. Once in Holland, you can travel to Brussels by way of Antwerp. I believe Britain has declared war against Germany. The behaviour of Von Halwig and those other Prussians is most convincing on that point. If so'——

'Does my presence imperil you, Captain Dalroy?' she broke in. She could have said

nothing more unwise, nothing so subtly calculated to stir a man's pride.

'No,' he answered shortly.

'Why, then, are you so anxious to get rid of me, after risking your life to save me a few minutes ago?'

'I am going straight into Belgium. I deem it my duty. I may pick up information of the utmost military value.'

'Then I go into Belgium too, unless you positively refuse to be bothered with my company. I simply must reach my sister without a moment of unnecessary delay. And is it really sensible to stand here arguing, so close to the station?'

They went on without another word. Dalroy was ruffled by the suggestion that he might be seeking his own safety. Trust any woman to find the joint in any man's armour when it suits her purpose.

(Continued on page 35.)

A E R O P L A N E S.

By S. MACNAUGHTAN, Author of *The Fortune of Christina M'Nab*, *A Woman's Diary of the War*, &c.

LEONARDO DA VINCI, painting angels and flights of heavenly beings five hundred years ago, is not perhaps generally connected in the public mind with the notion of modern aerial flight. Yet while painting his winged cherubim he had definite ideas on the subject, and made designs for a very early type of flying-machine, which were published three centuries later.

It has been said that Art is the prophecy of Science; and there are few more striking instances of this than in the case of the painter of long ago, with his skyward vision, writing in terms which were hardly comprehended by his contemporaries, and were mocked at by those to whom he confided his schemes.

Leonardo, the distinguished sculptor, architect, and musician, was also one of the greatest mechanicians of his day, or of any day. An account of him adds that he was an engineer, an anatomist, an astronomer, a chemist, a geologist, and a geographer, as well as an insatiable and successful explorer. It is idle to speculate what he might have accomplished had he possessed merely one talent. It is as a maker of aeroplanes that we salute him, and then pass on through a list of distinguished names and with the shortest possible histories of the men who had the same end in view as had Da Vinci.

It is a long flight from the days of the magic painter to the vigorous man of modern mark, harnessing force and experimenting, patiently observing, daring even the birds to equal him in his poised flights, and finally completing contracts and taking up patents on a commercial basis. But very much farther is it from the days of Archytas, the philosopher of Tarentum, who lived in 400 B.C., and had a marvellous wooden pigeon

which was suspended in the air by balancing, and animated by an 'occult and enclosed spirit.' But whether visionary, occult, or practical, the aim of these men has been the same; and from the child who looks up into the sky and says, 'I wish I were a bird, and could fly,' to the scientific discoverer poring over drawings and plans, mankind has set himself from the dimmest ages of history upon the conquest of the air.

The conquest, of course, was not won without sacrifice; and in saying this it is inconceivable that it can mean only that there have been lamentable effects of experiments, or that the toll which must be paid by the pioneers of aviation has been heavy. We must go beyond this—past Da Vinci, who, had he flown in the fifteenth century, would no doubt just as easily have been 'brought down' as aeroplanes are brought down in modern warfare, although by means very different—and past the old philosopher with his occult wooden pigeon, until we find ourselves, in the seventeenth century, in a lonely cell inhabited by a Jesuit monk, who is imbued with the idea that copper globes in which a vacuum has been formed will lift, and who tries from his solitude to gain enough credence for his idea to tempt the world of men outside the walls of the monastery to place sufficient faith in his discovery to finance the matter which he has in hand. Then, laying aside the ideas so dear to him, and the all-absorbing conceptions which he had formed of flight, he offers them as one lonely man's sacrifice to a vow. The Jesuit Order, which forbids any one of its Order from acquiring money, debarred Francis Lana, filled with his visions, from putting them into practice. In his coarse habit, and seated in

his lonely cell, the monk wrestled with his ideas; saw them with the eye of vision maturing and carried into effect; felt within him the triumph of the man of science, bringing the elements to do his bidding; and then quietly and unostentatiously, perhaps before some shrine or in front of a simple crucifix in his cell, laid down not only earthly ambitions but knowledge itself, as it has often been laid down before for the sake of an ideal.

To one man sacrifice, and to another attainment! It seems to be the rule of life. In the East we have seen a buttressed wall of enormous length and thickness, built by an all-powerful monarch, and we learned that at regular intervals, following the line of the beautiful architecture of the design, there had been a human being buried alive in order to give life to the wall. Old buildings were, as we know, thus 'consecrated'; and there is no doubt that the very ancient superstition of not walking underneath a ladder is a survival of the days when a ladder against a wall suggested an unfinished building, and that the shadow of a man was intimately connected with the early ideas that life might be imprisoned within the walls and the soul of the man might be sacrificed to the life of the edifice. The story of the buried Burmese underneath a wall seems at first sight merely a tale of cruelty and torture, or a madman's caprice; but undoubtedly there is the same spirit of sacrifice running throughout history, invisible but always present.

In later days the idea has come to be connected more sanely, perhaps more wholesomely, with the notion of work as the only laudable and legitimate test of sincerity and accomplishment. We have come to know that

The heights by great men reached and kept
Were not attained by sudden flight;
But they, while their companions slept,
Were toiling upward in the night.

We have almost altogether eliminated from all fine endeavour the element of luck. We know that toil, honestly expended, and unfalteringly tireless attention to duty are the only royal road to the right sort of fame; but an earlier people, visioning the idea of sacrifice sometimes cruelly, sometimes in all the beauty of a definite faith, have this in common with all those who have worked—that some measure of suffering is necessary to attainment.

Now the evolution of the aeroplane, modern as we conceive it to be, inextricably associated in our mind with the very latest developments of warfare, has demanded from its early pioneers the tribute of almost unbelievable industry, of courage, and of daring, combined with a very sober sense of daily duty.

Francis Lana, laying down his experiments before the crucifix in his cell, was perhaps so filled with the highest ideals that the sacrifice itself counted for very little with him. Or, like

his brother monk, the inimitable artist, who burst into tears as he threw his paints and brushes out of the window of his mountain cell into the roaring torrent that ran below the walls, he may have felt that a vow demanded of him almost more than the human spirit could bear. Be that as it may, the idea of flight died and was buried, as men died and were buried under the long wall in Burma, and the notion of flight for human beings, with their earthbound motions regulated by the mysterious law of gravitation, slept for a time, and perhaps—in some manner little known to us—matured and grew.

In 1648 John Wilkins, then Bishop of Chester, suggested that a flying chariot with wings operated by springs would be successful.

Besnier published a crude design for a flying-machine in 1678.

Henry Cavendish discovered hydrogen in 1766, and Dr Black of Edinburgh conceived the idea of lifting things with it. Cavallo, in 1782, successfully tried it in bubbles.

Stephen Montgolfier then began to experiment with balloons, and in 1783 was able to send up a large balloon one thousand feet. Later on in the same year a balloon went up six thousand feet, and covered one mile before landing. These balloons had been sent up empty; no one had yet ventured to go in them. The first man to make the experiment was Monsieur Pilâtre de Rozier, who went up eighty-four feet in a balloon held by ropes. Toward the end of the same year he went up again with the Marquis d'Arlandes, and they went for a short cross-country flight.

After this Mr Blanchard made several free ascents, twice with Dr Jeffries as passenger, in hydrogen, or rather coal-gas, balloons. The second time they were blown across the Channel; and as Dr Jeffries was under agreement to pay all expenses and jump out if required, he must have had a nervous time, for it was with the greatest difficulty—and then only by throwing everything, even their coats, overboard—that they remained above earth until the French coast was reached.

Sir George Cayley was the first known man to conceive the actual modern aeroplane. In 1809 he made some gliders; in these he induced his gardener and coachman to make ascents, and obtained very good results—for the aeroplane. It was he who realised that some engine was necessary as a propulsive power, and it must have been for this reason that he discontinued his gliding experiments, little knowing how near he was to the point reached by Lilienthal a hundred years later.

In 1842 Henson filed a patent specification for an aerial steam carriage monoplane, and a Bill was actually brought before Parliament dealing with the Aerial Transit Company. Perhaps it is needless to say that Henson eventually had to take his model to America;

and it was not until 1866 that the Aeronautical Society of Great Britain was formed.

The whole history of aeroplanes is one of surprising successes and surprising failures and disappointments.

Horatio Philips started building a helicopter, which he imagined was going to electrify the world; but he found this a much more difficult task than he had supposed. Nevertheless he contributed to a difficult task an immense amount of technical knowledge in construction.

We must pass very briefly in rotation the names of others who contributed, here a little and there a little, toward the final success of a finished flying-machine.

Pénaud introduced elastic-driven toy aeroplanes, which were popular for the moment; and Renard built a balloon called *La France*, which was driven by an electrically operated propeller. In 1890 Ader built a remarkable-looking monoplane, in which he claimed, on 9th October 1890, to have flown fifty yards. The French Government assisted him, and he built two more machines, but failed in 1897 to fly round a circular course before a military commission, although he flew three hundred metres in a straight direction. In 1893 Lawrence Hargrave drew attention to the box-kite formation; and in 1891 the Smithsonian Institute at Washington published the result of Professor Langley's experiments on inclined planes, and gave to the world at large the first real treatise on aerodynamics. This work became a standard reference, and Langley went on to prove his theories by building a tandem-surfaced model monoplane, which was highly successful. No doubt about this time the pursuit of knowledge and the nearness of the final conquest of the difficulties made the whole subject of aeroplanes one of favourite interest to the engineers who made them, and to the world which looked on and waited.

It is difficult now to realise what changes in history might have been witnessed had the final discoveries been attained a little earlier. It is inconceivable, for instance, to imagine that the Boer war could possibly have continued three years had aeroplanes been in use. One well remembers the surprises that the war had for soldiers and civilians alike. A kopje was found, perhaps, to be bristling with men where the presence of the foe was unsuspected or the position of a gun was unknown. It is, indeed, almost impossible to realise that only a very few years ago information was so difficult to collect that the 'fog of war' hung over every operation. Strategy never changes, and has not done so since the days of Hannibal; but tactics have been entirely altered by the presence of the aeroplane. And one can imagine the puzzled bewilderment of some soldier, who perished perhaps only a few years ago, returning to earth and hearing of attacks made far in the rear

of the enemy's fighting-line, bridges destroyed behind an advancing foe, and ammunition stores set on fire by some bomb dropped from overhead.

It is, however, anticipating the history of the final success of aeroplane-building even to hint at these things. The Wright Brothers have not been mentioned yet, and until the Wright Brothers come into the lists the whole story of the successful building of aircraft remains unfinished and almost untold. Their discoveries have about them the mystery and the real dramatic excitement of some finely told story. In Europe the Voisin Brothers were working, as were also Chanute, Professor J. J. Montgomery, and many others, and their work was for the most part before the eyes of the world; but over the doings of the brothers Wright there hung always a veil of mystery pleasantly baffling, and a silence to which the Press itself conformed. Very scanty information came through the American papers as to the doings of the two brothers. But in the summer of 1908 Mr Wilbur Wright came to Europe, leaving his brother in America to attend to a machine they were building for the American army. The state of suppressed excitement in Europe is difficult to imagine or describe when Mr Wright settled down at Le Mans to make his preparations. Slowly and methodically, in a way that had characterised all the brothers' experiments, he made his preparations, and on 8th August he flew for exactly one minute forty-seven seconds. Three days later he made another short flight of four minutes, but did figures-of-eight and executed such manœuvres as proved he had absolute control of the machine. The general opinion is summed up in the words of Delegrange, who was there: '*Eh bien. Nous n'existons pas. Nous sommes battus.*'

Wilbur Wright now changed the scene of his operations to Auvours, and seemed to be making slow progress. Few people knew, nor is it even generally known to-day, that Wilbur Wright was himself, to all intents and purposes, learning on his own machine. Although surpassing all others in his experience of riding the air, nevertheless it happened that he was strange to the precise system of control embodied on his own aeroplane. When, after their gliding experiments, the two brothers built their motor-driven aeroplane, they arrived at a point at which their opinions differed. Each preferred a different arrangement of levers for manipulating the same system of control; and just before Wilbur Wright packed up his machine, which thereafter remained in its crate during the long period of negotiations in foreign countries, he had introduced the universally pivoted warping and rudder lever that characterised all the early Wright biplanes. This control he considered to be best suited to his requirements; but he had not had time to become expert in its use—which very

simple explanation accounts for a great deal that was often mystifying to the good spectators of Le Mans. Every day he flew a little longer, but by 5th September had only reached twenty minutes in the air at a time, when suddenly the news came that Orville Wright had flown for over an hour at Fort Myer, in America, marred by the news of his accident a few days later, which resulted in the death of Lieutenant Selfridge, his passenger. Wilbur had only been waiting for his brother to make the first flight of an hour, so that America should have this honour, and he on 21st September flew for an hour and a half. This was followed by other flights on 6th and 11th October of over an hour each, with a passenger, thus completing his contract with the Weiller Syndicate, which was to take up his patents in France on a commercial basis.

In the meanwhile Farman and Delegrange continued on their machines, and on 29th September Farman remained forty-three minutes in the air.

Louis Blériot and Esnault Pelterie were working hard on monoplanes and achieving some successes.

There were some large prizes offered about this time, and Wilbur Wright won the first Michelin prize for duration with a flight of one hour fifty-four minutes. He then moved his headquarters to Pau, where he began to teach pupils to fly his machine.

Early in 1909 Mr Moore Brabazon made some short flights on a Voisin biplane at Châlons. He brought a Voisin machine over to England, and settled down at the Aero Club's ground on the Isle of Sheppey to master his machine.

Cody also put up a four hundred yards flight at Aldershot on an army biplane.

In March of that year the Aero Club de France issued its first pilots' certificates to Delegrange, Santos Dumont, R. Esnault Pelterie, H. Farman, Wilbur and Orville Wright, Captain Ferber, and L. Blériot.

Santos Dumont about this time built a tiny miniature monoplane called *The Demoiselle*, and, to everybody's surprise, succeeded in flying two and a half kilometres across country in it.

In March 1909 the First British Aviation Exhibition took place; and in April the *Daily Mail* offered one thousand pounds for the first circular mile flight by a British subject, to take place in Britain on a British machine. This was the third prize offered by the *Daily Mail*, the other two being ten thousand pounds for a flight from London to Manchester, and one thousand pounds for a cross-Channel flight; and by the end of April there were over a hundred prizes, if not all of four figures, of sufficient inducement to make people spend money and take the risks necessary to obtain them.

On 19th July Hubert Latham made an attempt to cross the Channel on a new type monoplane

called an Antoinette, on which in future days he was to win himself a name to go down to posterity. After going six or eight miles his engine failed, and he was obliged to descend in the water. Fortunately his machine floated, and he was picked up (smoking his inevitable cigarette) by a torpedo-boat. On the 25th Blériot succeeded in crossing in forty minutes, winning the *Daily Mail* prize. Latham made another attempt; but his engine again let him down, this time only a few miles from the English shore.

In July also we find a young mechanic called Louis Paulhan learning to fly a Voisin at Issy-les-Moulineaux. By the end of the month he had learnt enough to fly from Douai to Arras, a distance of thirteen miles, as a result of which he formally entered for the London to Manchester flight, which he won.

September of this famous year finished with sensational flights by Santos Dumont and Captain Ferber.

On 21st May 1910 Count Jacques de Lesseps crossed the Channel, and on 2nd June Mr Rolls made the double trip across and back without alighting.

The progress of aeroplane-making from this time onwards contains scores of famous names, and we find they are far too numerous to mention.

Chavez crossed the Alps on a Blériot machine in September, and was killed within thirty feet of the ground. Messrs Grahame White, Radley, and Ogilvie left for America to compete for the Gordon Bennett Cup, which had been won by Mr Curtis the preceding year, the trophy being successfully claimed by Mr Grahame White.

Up to this time there were in Europe only two or three recognised types of aeroplanes—the Farman, the Blériot, and the Antoinette. The last-named dropped into disfavour, as it was a very difficult machine to fly, and several accidents occurred owing to the wings breaking in the air.

Monsieur Pelterie built his monoplane of steel, and the matter caused as much sensation as the first steel ships had done. An immense stride was made by the Nieuport monoplane, which signalled the first real attempt to cut down head-resistance by eliminating all unnecessary wires, and enclosing the pilot and passenger as far as possible in a stream line body. Head-resistance is, of course, considered almost more than anything else at present; but the Nieuport monoplane made a very distinct advance.

The year of big races for large prizes was 1911. Captain Bellenger flew from Paris to Bordeaux in five hours ten minutes. Prier flew from Hendon to Paris without a stop. Vedrines won the Paris-Madrid race; and Lieutenant Conneau—or Beaumont, as he is more generally called—won the Paris-Rome, circuit of Europe, and of Great Britain, on a Blériot. Fourny did a non-stop flight of seven hundred and twenty kilometres in eleven hours on a Maurice Farman,

and Garros reached a height of thirteen thousand nine hundred and forty-three feet.

In October the French Government held a military competition, for which most of the large French firms entered. This competition called for a weight-lifting machine and more powerful motor, and was won by a Nieuport with a one hundred horse-power Gnome engine; while a Deperdussin and Breguet with similar engines were respectively second and third.

In 1912 flights from London to Paris became common. The British military trials took place on Salisbury Plain, and were won by Cody on a biplane of his own construction, a Deperdussin monoplane being second. Neither of these machines, however, proved as efficient as the B.E. 2 type biplane constructed by the Army Aircraft Factory.

The hydro-aeroplane began to be developed, some of the leading firms attaching floats to their standard machines, and others building a special type.

Harnel flew from Dover to Cologne with a passenger on a Blériot. With the name of this distinguished man it seemed almost as though the last word in flying had been said. His premature death was more than a national calamity. As a matter of fact, the whole business of aircraft is probably only in its infancy, and already we hear that aeroplanes can be built to lift four people with ease, while within the next few years we may confidently hope to see big touring aeroplanes, which will be looked upon as the normal means of conveyance, and not a sensational way of committing suicide, as some people seem to regard it at present.

The whole subject is intensely interesting, even from a lay point of view; but most of all

it is a sight far beyond any imaginings that one may have had to see the actual action of aircraft in war. We remember well in Flanders seeing Taube and other aerial craft coming daily out of a clear sky. But nothing ever impressed us more than seeing five aeroplanes, like beautiful birds of prey, wheeling and circling around each other in the air. No flight of eagle ever seemed more graceful than theirs as they planed down from far away with a rush of wings! It was always out of a blue sky that they came! Flying is no use in murky weather; and so, in spite of their destructive mission, the memory of their appearance is always connected in our mind with the sunny days. Far away in the arch of heaven a little speck would be seen, and then, as it came nearer, one heard the sound of guns, and all around it was seen bursting shrapnel and tufts of smoke hanging for long up there in the still air.

The pity of it is that these wonders of our age should only be made to be destroyed; and that the patient work of the far-seeing old saint in his cell, the conception of the heavenly painter, and the patient work of modern science, when it has reached perfection, should merely be a target for bullets. But the thing itself persists, and honour is due to the men who have worked patiently at it and died unsung. They asked to sweep the stars down from the sky, and to match their strength with the eagle or the hawk, as they lean against the wind; but they died in obscurity, earthbound, like most of the rest of us! That which they sought was only a dream or a vision; but we, whose eye can now pierce the defences of the enemy and discover his most secret doings, may well send a thought back to the workers who never saw the fruit of their most earnest toil, the strivers who never reached a goal, the failures who made success possible.

THE BRAVEST OF THEM ALL.

CHAPTER II.

NOW Jackie was a brainy little chap (indeed, I've met with few boys whose brains worked more quickly), and as he went to the kitchen and looked for the key his brain matter was buzzing in his head like a bee in a bottle.

Suppose, while the burglar was drawing the beer, he (Jackie) pulled to the door and locked it before the burglar had time to stop him! Then he would be caught like a rat in a trap, because the cellar window was strongly barred.

'This the key, sonny? All right;' and the burglar took the key, fitted it in the lock, and threw open the cellar door.

'You first, sir,' he then said, with a mock bow, for he also was pretty brainy, and was not going to take any chances. So Jackie's plan failed.

The burglar carried a generous quantity of

beer back to the dining-room. He seemed to be prodigiously thirsty.

'Decimal fractions!' he exclaimed when he had taken a huge draught of beer, wiping his mouth with the back of his hand. 'Whew! but I'm 'ot!' And indeed he looked it. His face was red and covered with little beads of perspiration, whether due to the beer, the pickles, or the beer I cannot say. Perhaps a combination of the three.

He threw his fur cap and heavy coat on the floor, and sat with his waistcoat open.

Opposite him the boy with the quiet hazel eyes was regarding him attentively, and behind the eyes Jackie's brain was humming like an electric motor.

'W-would you like a bath?' he suddenly asked.

'A bath! Is there a bath 'ere?' the burglar inquired with much interest.

'Yes,' said Jackie eagerly, 'there is. At least,' he added, correcting himself, 'it's not really a bath. It's a well.'

'A well!' exclaimed the burglar with disappointment. 'No, sir. Ye don't catch this chicken bathin' in a well.'

Jackie's face fell. Was this plan going to fail also?

'It's not exactly a well,' he explained, with beating heart. 'The well was filled up nearly to the top, and the top part is used as a bath.'

'Let's 'ave a look at it, sonny,' said the burglar, gathering up his coat and cap. 'Go 'ead!'

This was just what clever Jackie wanted, so he led the way with suppressed eagerness.

Now, in the days of long ago, when gentlemen went about dressed in tin canisters and coal-scuttles, the man who built the Tower very wisely covered in the spring which gave the garrison water. He had built over it a kind of offshoot of the guard-room, which, as I have already explained, was now used as the dining-room by 'Markham, R.A.' To reach it you passed out of the guard-dining-room into a narrow, dimly lighted passage formed in the thick main wall of the Tower. At the end, seven steep steps led down to an oaken door opening into the room over the well.

'Markham, R.A.,' as Jackie had already explained to the burglar, had filled up the well to within a few inches of the top, and used the space left for his morning douche. Water was led in from the modern cistern in the courtyard, and run off by a pipe passing through the wall and emptying itself into the dry moat or fosse outside—the moat that had been made into a beautiful rock-garden, and was the envy of four counties.

The bathroom (for I must call it by that name) had one little window high up near the ceiling, facing south, so that the room was well lighted. But 'Markham, R.A.,' would allow no furniture to be put in, because, he said, furniture would be an anachronism. (Look that word up in the dictionary. I haven't time to explain it.)

There was another thing, also, 'Markham, R.A.,' wouldn't do. He refused to remove a large bolt fastened to the outside of the door. It was there when he bought the Tower, and there it should remain. It was just a big bar of iron which shot into a hole in the stone post against which the oak door closed. He did, however, put an old-fashioned lock on the inside of the door. And he had also suspended from the stone ceiling a sort of roughly made shower-bath.

Now it was this bolt that wise Jackie had thought of when he suggested that the perspiring burglar might like a bath.

If he could only persuade him to enter the

bathroom, and then, when he was well in, shoot forward that big bolt, why, he would be as safe as safe (than which nothing is safer) till Uncle Tom and Aunt Christine returned.

The bathroom both looked and smelled cool when the burglar entered it that hot day. The bath happened to be full, and a trickle of water from the tap was dripping into it very musically.

Jackie had gone down the steps first, and stood outside against the partly opened door, hoping the burglar had not noticed the bolt.

'Cipher me!' the burglar sighed, as he dropped his cap and coat on the floor. Then he unfastened his waistcoat and threw that on top of the coat.

Then, 'W-w-won't you close the door?' asked Jackie. It seemed improper, even for a burglar—

'You leave that door alone, sonny!' shouted the burglar. 'You can draw it to a bit if you're over modest, an' stand behind it. But, mind you, yell whenever I call out.'

So with trembling fingers and fluttering heart Jackie began to draw the door toward him. 'That'll do!' the bather called out when the door was still a long way from being closed.

Jackie paused, and you would have heard his heart beating had you been standing by him.

'Yell!' commanded the burglar.

'Y-y-yes!' answered Jackie.

Two thuds followed: that would be the bather kicking off his boots; then one or two softer sounds, which were perhaps caused by the dropping of his various other garments.

'Are you there?'

'Yes, sir!' came the quick answer, in a thin, high-pitched voice.

Splash! hoch! ah! splash!

'Cipher my eyes!'

Hoch! splash! splash! and other sounds very like those made by an elephant when bathing. The burglar was evidently enjoying himself.

'Yell, sonny—yell!' he commanded.

'I'm here, sir!'

Splash! hoch! ah! spl—

CLANG! CLICK! and it was done, the bolt shot home, and Jackie on the top of the steep steps waiting for developments!

These soon came, the hollow clang of the door as it closed smartly against the stone post bringing the burglar out of the bath with a burst of fractions, both vulgar and decimal, that exhausted the limits of any arithmetic book ever published.

'Open the door!' he yelled. 'Open the door! I'll flay ye alive when I catch ye!'

Bang! bang! bang! and at the third bang Jackie fled into the courtyard.

Now this small boy, who was 'only just' a Scout, knew all about the science of hydraulics, because the man from Minsterton had taught him. This professor, a gentleman with one eye and a breath, had spent a day at the Tower

diagnosing some slight disorder the water-taps and other apparatus were suffering from. He had explained why a pump pumps, and imparted to Jackie a most useful amount of knowledge concerning clack-valves, cup-leathers, sumps, &c. He also showed him how you could only enjoy a shower-bath so long as you pulled the chain in the bathroom down tightly. No pull, no shower. And of course the thing was very simple when once you knew it. The other end of the chain was tied to a plug in the bottom of the cistern, and the plug was held down by a weight. Pull the chain, up came the weighted plug, and, splash! out rushed the water, giving you delightful shivers all down your back.

So when Jackie had run into the courtyard to get away from the burglar's banging and his mathematical language, he thought—and his brain fairly whizzed as he did so—that if he could only keep the plug up and the chain fast the water would rush out of the cistern, fill the bathroom, and keep the burglar quiet and cool till Uncle Tom's return.

He looked up at the cistern, which had been erected in the courtyard, and was carried on a wooden framework. The one-eyed professor had brought a ladder with him, so that it was quite easy to enter the cistern then. But Jackie had no ladder, and climbing the framework was a physical impossibility, especially for one who was 'only just.' The cistern was near the room over the well, the chain passing from it to the shower being plainly visible, but, alas! quite out of reach.

'I have it!' exclaimed the Guard, as a bright idea occurred to him.

He flew into the Tower, and soon returned with a ball of twine. Tying a stone to one end of the twine, he tried to throw it over the chain.

At the first attempt the stone went too low for the chain, but not low enough to miss the kitchen window, one pane of which it broke.

The next attempt succeeded, the twine was over the chain, and no sailor ever pulled more heartily on a rope than Jackie pulled on that twine. Down came the chain, up went the plug, and at once he heard the rush of water from the cistern.

The Guard fairly danced with joy, especially as the hammering on the door of the bathroom increased in violence.

'Stop that water! Stop that water!' the burglar yelled. 'It's over my feet!'

For answer, Jackie, in a glow of excitement, dashed round to the edge of the moat, and to the point at which the pipe draining the bath projected from the wall. This pipe he plugged as well as he could with earth, grass, and stones. Then he rushed back to the courtyard, seized the handle of the pump, which was fitted close to the cistern, and, *clickety-clack! clickety-clack! clickety-clack!* went to work with a will. He

had often let his daily kind deed take the form of a turn at the pump, so relieving Fred; but he never pumped then as he pumped now.

When his arms were tired he ran round to the bathroom to inspect progress. Hurrah! the water was half up the first step.

Back to the handle again. *Clickety-clack! clickety-clack! clickety-clack!* till his arms fairly ached. Pause for a minute's rest, then at it again, with panting chest and streaming with perspiration. And all the time he could hear the water rushing through the shower-bath!

Once more to the bathroom door. Glory! the water was half up the steps!

'Help! help!' the burglar was now yelling, and with something like real terror in his voice. 'Let me out, sonny! Let me out!'

A wild half-hysterical laugh came from Jackie's parched throat, and once more he flew to the pump-handle.

But with the best will in the world you cannot pump at express speed for ever. The time soon came when the pump-handle slipped from his grasp, and Jackie fell panting on the gravel of the courtyard.

He lay there for a time, wondering what the burglar was doing now, as his shouts had ceased and all was quiet. He also wondered if the ache would ever leave his arms. And as he lay he suddenly realised that the shower had stopped, and that the cistern must have emptied itself. Could he pump any more? Certainly he couldn't fill the cistern again.

He would look through the bathroom window first, and see how the burglar was getting on. Perhaps—— Here a horrid fear struck a chill to the heart of the Guard.

He ran as fast as he could to the bottom of the garden where there was a short, heavy ladder, and this he dragged to the outside of the wall of the bathroom, and with great trouble reared it against the little window looking down into the well.

Peering through, he saw the burglar at the far end of the room. With arms outstretched, he seemed to be trying to climb up the wall with his finger-nails; his head was thrown well back, and the water just lapped his chin.

Jackie crept down the ladder again, a tremendous 'brain-storm' seething in his head. What would happen to him if he 'drowned' a burglar who hadn't really burgled? True, there was the silver box, absent-mindedly slipped into his pocket, and the fit of abstraction during which he ate Jackie's lunch. But were these really acts of burglary? The burglar's life hung in the balance, though he didn't know it.

Whilst still in doubt, he suddenly bethought himself of his lapsed patrols. So he made the tour of the Tower, partly to gain time for thought, partly to draw encouragement, or otherwise, from the Girl-on-the-Canvas. Should he go on pumping and drown the burglar out-

right, or should he let him stay stretched out along the wall of the bathroom, with the water just bobbing against his chin?

The Girl-on-the-Canvas seemed to say, 'Pump away, Jackie!' I really don't think she did. I believe some trick of the light made Jackie imagine that was what her eyes said. But her lips were far too gentle, I am sure, to allow her to have art, part, or lot in the drowning of any hairy-capped burglar.

Still in doubt, he extended his patrol to the very roof of the Tower. From here you could see the country for miles and miles around. The moors rolled away from the Tower, billow beyond billow, all lighted up by the bright sunshine, save toward the west, where some black-looking rain-clouds cast a deep shadow. There was hardly a sign of any human habitation near, unless the spire of Minsterton church could be reckoned as such. Jackie and the burglar seemed to have the whole world to themselves. And yet the thought never once entered his head that he might leave the burglar in the bath, desert his post, walk to Minsterton, and so find Fred and assistance. Was he not the Guard of the Tower?

Jackie went down the winding stone staircase again, still sorely puzzled as to what was the right thing to do.

He took another peep through the window. To his surprise, he saw the water was now only reaching to the burglar's waist! What had happened?

He ran round to the moat, and there found that his earth-and-stone plug had been forced away by the water behind it, which was now gushing out in a stream as thick as his arm, and running away down into the rock-garden. He knew he could never stop that stream; he knew he could never fill the cistern again. The burglar's life was saved, and on the whole Jackie was glad of it.

He mounted the ladder again. The water was now level with the burglar's knees, and he seemed very cold, for he was shivering in a most distressing manner.

Looking up, the burglar caught sight of Jackie's anxious face at the window. 'S-s-sonny,' he said, with chattering teeth, 'you've b-b-bested me!'

'Are you cold?' Jackie asked with feeling.

'C-c-cold isn't the w-w-word for it!' chattered the miserable-looking burglar. 'Let me out, s-s-sonny! You've d-d-drowned me!'

But Jackie shook his head.

'Then, for the l-l-love o' 'eaven, gi'e me s-s-summatt to drink, s-s-summatt 'ot, as 'ot as ye l-l-like!'

'Shall I bring you some coffee?' Jackie asked.

'Ay! d-d-do!'

So Jackie slipped down the ladder again and ran to the kitchen. It was easy to make coffee.

He had often seen cook do it. All you needed was some ground berries at the bottom of a jug, with boiling water poured on them. He raked together what was left of the kitchen fire, added a few dry sticks, and soon had the kettle humming. Coffee he found already ground in the canister (perhaps he used rather more than was strictly necessary), and in a very short time a steaming jug of coffee was being lowered by a piece of string to the shivering and expectant burglar.

Everything went off splendidly, except that at one point of the jug's descent the burglar gave a howl and skipped to the middle of the bathroom floor. That would be when some of the scalding contents of the jug splashed over and on to his bare shoulder.

'I'll bring you a rug, if you like,' Jackie suggested, when the burglar had had a few sips of coffee and his shiverings seemed rather less violent.

'Thanks, sonny. Yer a good sort!' the burglar replied very mildly indeed.

So Jackie hunted for one of Uncle Tom's rugs, and dropped it through the window.

Then he suggested that the burglar should tie his clothes, one at a time, to the string, and he would haul them up and take them to the kitchen and put them to dry.

The burglar was quite willing to agree to this, or indeed anything else. All his spirit seemed to have been washed or chilled out of him.

But when he reached the kitchen with the greatcoat, Jackie thought he would take the precaution of securing the little silver box. As well as the box he found a pistol, and a strange assortment of curious bars of steel or iron, with various cunningly made tools. All these, with the contents of all the other pockets, he carefully laid on the kitchen dresser, where they made quite a pretty and interesting display.

Now I want to remind you of one or two things about Jackie, so that you won't be too hard on him on account of what follows.

Remember, then, that he was alone in the Tower; that the burglar had eaten the greater part of his lunch; that he had worked fearfully hard in his endeavours, first of all, to drown the burglar, and then to make his shivering body comfortable till Uncle Tom's return. Will you also call to remembrance, very kindly, that Jackie had no father, that his mother was never talked about, that he was subject to violent attacks of 'funk,' and that, finally, he was 'only just' a Boy Scout?

Bearing all these things in mind, you will not be surprised to learn that a sudden flash of lightning, followed by a rolling peal of thunder, brought Jackie's heart to his mouth as he was standing by the kitchen window (not the one of which he had broken the pane, but the opposite one), examining the 'implements of his trade' he had abstracted from the burglar's pockets.

The black clouds he had seen from the roof of the Tower had crept up from the west, and with the next flash of lightning big drops of rain fell in the courtyard, making splashes on the gravel as big as shilling-pieces.

The rooms in the Tower grew darker and darker; and with each flash and peal the Guard grew more and more 'funky.' He felt his way along the dim passage and down the seven wetted steps to the door of the bathroom, and there listened. Not a sound could he hear.

He knocked timidly. No reply came. He knocked again more loudly. Still no reply.

Then a chill fear sent him with flying feet to the far corner of the dining-room. There he sat, his hands pressed close to his eyes to shut out the blinding flashes, whilst his hair rose and the skin of his back crinkled; and all the time the thunder crashed and pealed in one continuous roll from end to end of the moors.

(Continued on page 42.)

A VILLAGE IN THE NIVERNAIS—JULY 1915.

By LILIAN MARTIN.

IT lies in a land of woods and wooded slopes, with meadow valleys in between. Everywhere—in the hedgerows, towering up in the midst of the fields of potatoes and *betteraves*, and even amongst the corn and oats—are spreading walnut-trees loaded with nuts. In the early autumn the fruit will be beaten down with long poles, and then carefully sorted for grinding to furnish the delicious nut-oil with which the peasants flavour their salad and mayonnaise. Herds of white cattle, of the special Nivernais breed, feed in the pasture-land. Ducks (for which there seem to be no ponds), geese, turkeys, and fowls wander about outside the farmyards and round the doors of the cottages. Shaggy goats climb high up on the wayside banks for the tufts of thick grass that the cows cannot reach.

In the gardens that slope to the sun, peasant, farmer, and landlord are alike making preparation for the winter, when meat will be very dear, and perhaps even the bread scarce. Long rows of potatoes, peas, and beans rival each other in fruitfulness. Beds of lettuce, onions, carrots, radishes, and winter cabbage follow each other with only the smallest space between. Espaliers frame the oblong garden-beds, and the fruitful *oseille* invariably borders the grass paths. A vine, its leaves splashed with milky green sulphate, usually clings to the house wall. The loaded cherry-trees and currant-bushes are red as blood in the July sunshine. Pear-trees and plum-trees overhang the road. The peasants have no room for all the flowers that grow in an English cottage garden. Grocery-vans and bakers' carts do not rattle through the village every day, and if they did would find but few customers, for the people contrive to grow food for themselves and their cattle on their own plot of land. They grow their own corn, bake their own bread, save their own seed; and the endless cycle of sowing and reaping goes on from one generation to another on the same paternal fields. One finds lavender-bushes, and now and again the old-fashioned tall white lilies, flowering in the garden-beds; but even these

have very practical uses. The lavender not only scents the linen, but, steeped in alcohol, is applied to rheumatic joints and aching backs; while the lily-leaves are carefully preserved in case of cuts and bruises. The one extravagance is the carefully guarded rose-tree that grows by the door, covered over with wire-netting to save it from the depredations of inquisitive donkeys and hungry cows. In a few more pretentious cottages there are pots of pink and red geraniums; but these are the exception. Paint is a luxury almost unknown; the rough doors and window-frames and plain wooden shutters of the houses are a parched gray colour. One longs to paint their thirsty boards.

Lumbering oxen, their white flanks black with the teasing flies, draw the mowing-machines, and bring home at leisurely pace the loads of hay to the farms. Donkeys, borrowed, and harnessed in a line as many as five at a time, draw the peasant's load of hay, on the top of which often rides the grandmother in her white cotton cap. Horses are rare. The farmer's wife drives to town in a donkey-cart, and it is merely a very fiery ass that caracoles between the shafts of the phaeton from the château.

Clothes cost little, and wear very long. Sabots for the field and garden, made in the village, help to keep off rheumatism, and are not so expensive as leather. Men and boys walk about with only sabots on their bare feet in the summer, but the women wear home-knitted stockings all the year round. Short cotton skirts, with a bodice of some description worn loose over the top of them, and broad-brimmed straw hats are worn by the women for work in the fields. The skirts are patched indefinitely, and present a variety of hues, but a touch of French coquetry is seen in the careful dressing of the hair. Every one makes some attempt at a coiffure becoming to her age.

From the west there often comes the dull boom of the cannon from the artillery park at Bourges. Its regular beat brings joy to the few women who know their husbands are safe in the town. To the others, whose men are away

somewhere in that vague *là bas*, by which the peasants designate the long front that stretches across France, it brings a thrill of dread.

How every one works in the village! It is no empty boast that is sent to the husband in the trenches that the harvest will be gathered in, the cattle fed, and the soil worked for the coming year. The wife and often the grandmother are at work at four o'clock in the morning hoeing the roots and potatoes, or working in the hayfields. In the early morning, too, the sour, white cheese is made in the outhouse which is half-stable, half-dairy. Food must also be gathered for the rabbits (which nearly every one keeps for food), and an appetising mash of roots and bran and scraps made for the pigs. In the middle of the day, when the sun beats down fiercely, little groups of neighbours sit outside in the shade mending and knitting, while the babies lie on the grass beside them. Evening sends them back to the fields again, or to cut the grass by the wayside, which they take home for the cow in rough wheelbarrows.

For the most part there is tragedy and sorrow without rebellion. The days when their souls could be heard in the village, mingled with the barking of the dogs and the crowing of cocks, are over. They will tell you that the war is *bien triste, bien longue*, and that one often waits long, weary weeks between the coming of each treasured post-card; but they invariably end with, '*Madame, que voulez-vous?*' and with an all-expressive gesture turn to pick up the fallen fork or hoe. The saddest women are those whose husbands and sons are prisoners of war, or who have officially 'disappeared'; they know nothing and they fear everything; their days pass in alternate gleams of hope and despair.

The village is not without its heroes. There are steady, middle-aged *poilus* who have been promoted corporals. Not one or two proud fiancées can boast of lovers cited by *l'ordre de l'armée* for bravery, and there are mothers, alas! whose young heroes are dead on the field of honour. In the happy days to come, when the war is over, there will be a monument erected to these on the Place, under the trees, and once every year the children will crown it with wreaths, to the memory of those that fell for France and freedom.

There are strangers, too, in the commune. Some are soldiers sent to help to gather in the harvest. They receive much mute admiration from all the small boys, and the tales they tell in the evening as they sit round the table outside the farmhouse door enjoying the soup, the salad, and the cheese are eagerly passed from mouth to mouth. But these will soon be gone again; the others are poor exiles to whom return seems long delayed. In their hurried journey along the grand routes of northern France, they have seen the planted avenues on either side ruthlessly cut down to line the trenches. Some

have fled from burning villages, and the few bundles of clothes and bedding, and the one or two kitchen utensils, carried for miles, are all that is left to them of what was once their home. Standing on the rough stone floor of their temporary lodging, they will describe, with tears in their eyes, the red and black tiles in the kitchen they have left, the cupboard with the store of linen that took so many years to get, the clock that stood in the corner. The neighbours are very kind to them, and the children are already quite happy among their new friends. They remember most the cakes and wine given to them by some French officers one night that they passed under the shelter of a wall. But the mothers think day and night of their sons and husbands left behind, working at this moment for the hated Boches, and their one longing is to get back to find out what is left to them.

The church stands in the hollow of the village, and before the war was too big for its congregation. Most of the peasants believed in going to Mass even when they did not go. There were few children who did not learn their catechism, and every one knew that Mademoiselle Alice, who never missed a service, was a real saint. But anti-clericalism had its advocates, and Monsieur le Curé's *soutane* was suspected by more than the village dogs. But many old feuds are forgotten now. The curé gave many patriotic exhortations from the pulpit in those first dark days of the war, and was not ashamed of the tears that rolled down his face one memorable Sunday as he told the story of a young hero of eighteen known to all the village. When the bell sounds for evening prayer, many women troop into the church straight from the fields, walking noisily up the aisles in their mud-clogged sabots. The church is dark save for the glimmering candles around the high altar. The women kneel in silence, their eyes fixed on the swaying priest and his assistants, who stand and kneel, pray and chant. One can guess of whom they think in these quiet minutes snatched from the busy day.

The children do their part. One meets them in the lanes after school, their hands and arms protected by an old stocking, gathering nettles to be boiled and mixed with bran for the pigs. Others, more enterprising, collect snails, which they sell for fivepence the hundred. Quite tiny girls are often in charge of browsing cattle, which they belabour in no uncertain fashion with their stout cudgels. To-day shouts of laughter rent the air as rival barefooted climbers stripped the cherry-tree on the Place, and tired mothers looked up and smiled. It is for these same happy children that fathers, brothers, and lovers will go on killing and being killed until the victorious end. Meantime the village waits for their return, and works and prays as it has never done before in the years of plenty and of peace.

Chambers's Journal

SEVENTH SERIES

THE 'NEW LANDING' AT SUVLA BAY.

PICTURESQUE NOTES ON THE BEACH.

By AUGUSTUS MUIR.

A PITILESS, impartial sun, and a blue, cloudless sky; a long, gray, rambling horizon; hill and dale, plateau and hollow, clad in ragged stretches of sun-parched scrub; an island nine miles off, with its purple hills, like an isle of the homeland shore; a strip of sea, blue and serene as the changeless sky; and in the centre of all this a bay. It was in such a spot that the 'new landing' took place. To the west the bay is rock-bound; the land rears up in stony promontories, fretted with fiords which the sea has filled, where 'Tommy' loves to bathe. This changes to a strip of golden sand which runs up to meet the rocks and scrub of the hill ridge above, and then sweeps in a great curve south till it merges into a green cultivated plain coming down between the mountains.

The bay is dotted with craft of all descriptions: cruisers, destroyers, hospital ships, Atlantic liners, tramp steamers, transports, store ships, tugs, tenders, barges, launches, dinghies—a vast, variegated collection, all lying at anchor, or (if they be near the shore) slowly moving to and fro, so that they give no stationary mark for the enemy's guns. And they are there, in these hitherto deserted waters, for the one end—to feed the British firing-line, that thin gray scar which runs from the sea on the northward down over hill and scarp and gully to the mountain-ridge on the south; that thin gray scar on the earth which to the practised eye is a sufficient hint of trenches, where our men are lying alert by day and doubly watchful by night, and with each new dawn facing death undismayed.

Among the ships themselves there is incessant activity; small boats ply to and fro with messages; barges (called lighters), towed by launches, are transferring stores; and large motor-driven barges are carrying cargoes of men. The coast is cleft with a number of natural landing-places; and at dawn and dusk, when the shore work is mostly done, there ply from these rude wharves a quick stream of smaller craft, not least inconspicuous being a steam-pinnace, with four or five cutters in tow, which noses its way out toward the great white steamer with the green lines and Red Cross. These cutters carry wounded; and what a journey is theirs from

the firing-line to the hospital ship! First they have a jolting, hurried passage to the regimental aid post (the R.A.P.), where the battalion doctor is waiting to lend his skill and complete the first-aid efforts of the stretcher-bearers; second, a journey to the brigade field-ambulance; third, a journey in a Red Cross car to the clearing-station on the shore; and, lastly, a passage to the hospital ship. And every evening that long, low line of boats, bearing brave burdens, steals from the darkening shore, moves round many an anchored craft, then slowly makes out toward the great white ship standing clear against the sunset over the island hills.

The beach provides a picture in which a realist would revel. Throughout the space of a few weeks war has transformed it from a strip of dead, barren sand to a veritable hive of vivid, strenuous life. Here is all the clamour and hustle of a home market. Here every one works at fever-heat, from officials with red tabs on their shoulders down to the humblest private in pants, boots, and sun-helmet. The place is alive. There is no stillness anywhere. Barges are drawn in close to the shore; and chains of men are handing down the gangways all the precious merchandise of bully-beef, biscuits, butter, jam, sugar, tea, salt, and Maconochie, this last being an 'iron' ration containing stew and vegetable. The long line of men reaches in a human chain along the shore, where the cases are stacked, and sweating 'Tommies' are on the top piling them in neat, regular rows. Water-carts from Alexandria are landed from barges; and fatigue-parties (carrying empty red and green petrol-tins marked with a large white W) cluster round them like bees, to draw the water ration for their companies. Dotted over the beach are lines of men in extended order who clear up rubbish, so that nothing is wasted and nothing left to decay. Out perched on a promontory are a pack of fellows sorting great heaps of khaki kits, the property of killed and wounded. In all odd corners round the shore parties under vociferous N.C.O.'s are digging with the fiercest energy, making it more possible for boats to land, blasting the rock to increase the harbourage, and laying rails

whereon trucks may run to convey the heavier impedimenta which the life of an army demands, above all, if that army is to exist, a thousand miles from its base, upon a barren peninsula throughout the nerve-taxing rigours of a winter campaign.

One can better appreciate the quality of this activity when one grasps the basic and ever-present fact that there is no inch of that shore but is swept by shell-fire. On that beach nothing is safe. A horse and cart are jolting along the rough road; there is a puff of smoke, a detonation, and only the cart stands there a battered wreck; the horse and driver are no more. A row-boat puts out from the beach; a white cloud of foam, a sharp sibilant hiss, and the boat and rower are given up in fragments to the sea. A friend may be approaching to chat, and in the moment of pausing to light his pipe he has given you the unpleasant duty of helping to gather him together. These are facts which every beach-dweller and beach-sojourner must assimilate. To the latter they are facts of a semi-humorous order; they partake of the ludicrous. 'Tommy' on a visit to the beach from the firing-line regards the shells with derisive eye, confident in his immunity. Is he not from the firing-line? And on this open beach what infinitesimal space, after all, does he take up! So he argues, smiling to himself; and then there is a well-known, high-pitched, ringing hiss, and he leaps to the nearest dug-out like a bunny bolting to cover! Not so the permanent beach-dweller. He does not dive for a dug-out in moments of danger. Nor in moments of safety, on the other hand, does he regard the shells with jocular contempt. They are an integral part of his daily existence. He cannot, if he would, disregard them. They exist; and that ever-present cloud breeds in these beach-dwellers a peculiar fine quality which Omar Khayyám would have appreciated—an attitude of mind that implies a vast deal of philosophy, thought, and wit. He looks on life with the calm eye of one who knows he may not see another dawn.

One blessing is that you can always tell the type of shell that is coming. Shrapnel comes with a sharp metallic screech. It has a grating edge; it cuts the air with the noise of a red-hot iron plunged into cold water; there is a ringing note in the pæan of its passage; and it bursts with a sudden sickening clangour, as from a stupendous smash of fine crockery on a stone floor. Percussion shrapnel sounds similarly in the air; but its explosion is muffled, like the distant banging of a door. High explosive comes with a rolling, rhythmic, flute-like sound; it resembles the noise from the wheels of a passing freight-train; it is not unlike the call of a curlew, softened and repeated in a slow rhythm. Just before it explodes there is a change; the rhythm dissolves, the soft, wooing note disappears,

and the shell goes to ground with a sudden awful thunder like an express train screaming through the silence of a deserted station. Its explosion is like a solemn single note beat on a muffled drum.

There is one spot where this perpetual sickening dread is partially removed. Round in the northward contour of the bay there is tucked behind mighty massed-up rocks a little haven dear to the heart of 'Tommy.' Every evening, as soon as darkness sets in, a company of men are led down from the firing-line in Indian file. All night they lie in dug-outs provided for them high on the beach; and in the morning they troop down by sections to a bathing-pool. To get to it you ascend an incline, picking your way between the lines of little black Indian transport ponies, till suddenly the ground drops before you, and you are on the face of a cliff. To left and right great gray-brown rocks run out in ragged, shelving curves, enclosing a sheet of water sparkling and rippling in the morning sun. Section by section, as they come up to the cliff-edge, the men pick their way down the path; and it is amazing how at once their manner changes. That hunted look leaves the eye. They cast no quick glances upward. There is a careless fling about their movements, and a delicious abandon in the way they toss off their garments and plash into the shelving pool with shouts of laughter. Their whole manner speaks of holiday. For indeed that weekly or fortnightly bathe is 'Tommy's' only day of rest. Here in this rock-girt haven he is comparatively free from shells; and, moreover, that secluded spot has a flavour of Home. Lying on the yellow sand, you look across the gleaming pool and see a little rocky islet with white gulls fishing and crying.

Notable among the thronged and sweating denizens of the beach are hundreds of little black men from India. They are all employed on transport-work. Long lines of light wagons with shafts in the air stand in great neat squares, like a battalion on parade; and beside them are similar rows of Indian ponies with their shaggy hoofs and quaint eye-shades. Everything necessary to life has been brought with them, and flocks of odd-looking goats, in charge of native herdsmen, wander amid the scrub on the higher levels of the shore. You may go among the native troops as they squat and fling grains of rice into their mouths and munch them with strong white teeth. Their smile is quick, their speech pleasant, their voices smooth and soft. Sitting there round their fires they look more 'in place' on that arid beach than any white man. They are an integral part of the picture; they look entirely at home; they fit in. These troops are lithe, lean, slim; they are clean-cut and supple; they possess immense energy and exhaustless endurance. Yet there is an air of languor about them at all times. They sit on

their jolting wagons and fix a listless eye on the sea. They are never animated; they only look and look out of their unfathomable dark-brown eyes. But this languorous air is half-pose. When the time comes, as it has come in France, these brown eyes will light with lambent fire; the hooked and ugly knife will fly quick and straight and deep.

Evening falls; a day's work is done, the strain of labour on the beach relaxes, and a strange peace takes the place of all the fevered and throbbing life. Camp fires are lit, blue smoke ascends against the mellow sky where the red sun is setting over the sea. The little brown Indian boys creep closer over the fires and cook an evening meal. Horses munch their fodder, their great liquid eyes seeing nothing. 'Tommy,' pipe in mouth, conscious of felicity, settles in his dug-out to savour the brooding calm. There is no sound anywhere. A single pinnace moving in the bay strikes a needless jarring note. And so it happens every evening. A stillness as of a shore untouched by man settles on all things; but it is the calm before the storm. Shadows

deepen. Lights begin to glimmer along the beach. There is a jingle of buckled harness and the rattle of shafts. The spell is broken. Night falls. There are voices, hoarse words of command, the tramp of hastening feet, multitudinous noises from work upon the water, and the night's work has begun. Postmen from the firing-line hurry in with mails; ambulance-cars speed down with wounded; and ration-carts depart with ammunition, provisions, and water. An interminable line of men appear and form up in the darkness. 'Lie down!' comes the command, and a battalion squats like monkeys on the beach. There is laughter here, and many a merry jest, for are these fellows not off for a rest? Boats come in to shore, and they file on board and are caught away into the darkness to regain their strength on the slopes of island hills. Other boats put in from no one knows where. Men are landed. Shore lanterns flare in their faces. They are untried men; and, with a strange, keen, strained look in the eye, they move in slow progression upward toward the heights, bracing themselves for the pitiless burden of battle.

THE DAY OF WRATH.

CHAPTER II.—continued.

AIX-LA-CHAPELLE was more awake on that Wednesday morning at one o'clock than on any ordinary day at the same hour in the afternoon. The streets were alive with excited people, the taverns and smaller shops open, the main avenues crammed with torrents of troops streaming westward. Regimental bands struck up martial airs as column after column debouched from the various stations. When the musicians paused for sheer lack of breath the soldiers bawled '*Deutschland, Deutschland, über alles*' or '*Die Wacht am Rhein*' at the top of their voices. The uproar was, as the Germans love to say, colossal. The enthusiasm was colossal too. Aix-la-Chapelle might have been celebrating a great national festival. It seemed ludicrous to regard the community as in the throes of war. The populace, the officers, even the heavy-jowled peasants who formed the majority of the regiments then hurrying to the front, seemed to be intoxicated with joy. Dalroy was surprised at first. He was not prepared for the savage exultation with which German militarism leaped to its long-dreamed-of task of conquering Europe.

Irene Beresford, momentarily more alive than he to the exigencies of their position, bought a common shawl at a shop in a side street, and threw away her tattered hat with a careless laugh. She was an excellent actress. The woman who served her had not the remotest notion that this bright-eyed girl belonged to the hated English race.

The incident brought back Dalroy's vagrant

thoughts from German methods of making war to the serious business which was his own particular concern. The shop was only a couple of doors removed from the Franz-Strasse; he waited for Irene at the corner, buying some cheap cigars and a box of matches at a tobacconist's kiosk. He still retained the lantern, which lent a touch of character. The carriage-cleaner's breeches were wide and loose at the ankles, and concealed his boots. Between the sabots and his own heels he had added some inches to his height, so he could look easily over the heads of the crowd; he was watching the passing of a battery of artillery, when an open automobile was jerked to a standstill directly in front of him. In the car was seated Von Halwig.

That sprig of Prussian nobility was in a mighty hurry, but even he dared not interfere too actively with troops in motion; so, to pass the time, as it were, he rolled his eyes in anger at the crowd on the pavement.

It was just possible that Irene might appear inopportunely, so Dalroy rejoined her, and led her to the opposite side of the cross street, where a wagon and horses hid her from the Guardsman's sharp eyes.

Thus it happened that Chance again took the wanderers under her wing.

A short, thick-set Walloon had emptied a glass of schnapps at the counter of a small drinking-bar which opened on to the street, and was bidding the landlady farewell.

'I must be off,' he said. 'I have to be in Visé by daybreak. This cursed war has kept me here a whole day. Who is fighting who? I'd like to know.'

'Visé!' guffawed a man seated at the bar. 'You'll never get there. The army won't let you pass.'

'That's the army's affair, not mine,' was the typically Flemish answer; and the other came out, mounted the wagon, chirped to his horses, and made away.

Dalroy was able to note the name on a small board affixed to the side of the vehicle: 'Henri Joos, Miller, Visé.'

'That fellow lives in Belgium,' he whispered to Irene, who had draped the shawl over her head and neck, and now carried the jacket rolled into a bundle. 'He is just the sort of dogged countryman who will tackle and overcome all obstacles. I fancy he is carrying oats to a mill, and will be known to the frontier officials. Shall we bargain with him for a lift?'

'It sounds the very thing,' agreed the girl.

In their eagerness, neither took the precaution of buying something to eat. They overtook the wagon before it passed the market. The driver was not Joos, but Joos's man. He was quite ready to earn a few francs, or marks—he did not care which—by conveying a couple of passengers to the placid little town of whose mere existence the wide world outside Belgium was unaware until that awful first week in August 1914.

And so it came to pass that Dalroy and his protégée passed out of Aix-la-Chapelle without let or hindrance, because the driver, spurred to an effort of the imagination by promise of largesse, described Irene to the Customs men as Henri Joos's niece, and Dalroy as one deputed by the railway to see that a belated consignment of oats was duly delivered to the miller.

Neither rural Germany nor rural Belgium was yet really at war. The monstrous shadow had darkened the Chancelleries, but it was hardly perceptible to the common people. Moreover, how could red-fanged war affect a remote place like Visé? The notion was nonsensical. Even Dalroy allowed himself to assure his companion that there was now a reasonable prospect of reaching Belgian soil without incurring real danger. Yet, in truth, he was taking her to an inferno of which the like is scarce known to history. The gate which opened at the Customs barrier gave access apparently to a good road leading through an undulating country. In sober truth, it led to an earthly hell.

CHAPTER III.—FIRST BLOOD.

THOUGH none of the three in the wagon might even hazard a guess at the tremendous facts, the German wolf had already made his spring and been foiled. Not only had

he missed his real quarry, France; he had also broken his fangs on the tough armour of Liège. These things Dalroy and Irene Beresford were to learn soon. The first intimation that the Belgian army had met and actually fought some portion of the invading host came before dawn.

The road to Visé ran nearly parallel with, but some miles north of, the main artery between Aix-la-Chapelle and Liège. During the small hours of the night it held a locust flight of German cavalry. Squadron after squadron, mostly Uhlans, trotted past the slow-moving cart; but Joos's man, Maertz, if stolid and heavy-witted, had the sense to pull well out of the way of these hurrying troopers; beyond evoking an occasional curse, he was not molested. The brilliant moon, though waning, helped the riders to avoid him.

Dalroy and the girl were comfortably seated, and almost hidden, among the sacks of oats; they were free to talk as they listed.

Naturally, a soldier's eyes took in at once details which would escape a woman; but Irene Beresford soon noted signs of the erratic fighting which had taken place along that very road.

'Surely we are in Belgium now?' she whispered, after an awed glance at the lights and bustling activity of a field hospital established near the hamlet of Aubel.

'Yes,' said Dalroy quietly, 'we have been in Belgium fully an hour.'

'And have the Germans actually attacked this dear little country?'

'So it would seem.'

'But why? I have always understood that Belgium was absolutely safe. All the great nations of the world have guaranteed her integrity.'

'That has been the main argument of every spouter at International Peace Congresses for many a year,' said Dalroy bitterly. 'If Belgium and Holland can be preserved by agreement, they contended, why should not all other vexed questions be settled by arbitration? Yet one of our chaps in the Berlin Embassy, the man whose ticket you travelled with, told me that the Kaiser could be bluntly outspoken when that very question was raised during the autumn manœuvres last year. "I shall sweep through Belgium thus," he said, swinging his arm as though brushing aside a feeble old crone who barred his way. And he was talking to a British officer, too.'

'What a crime! These poor, inoffensive people! Have they resisted, do you think?'

'That field hospital looked pretty busy,' was the grim answer.

A little farther on, at a cross-road, there could no longer be any doubt as to what had happened. The remains of a barricade littered the ditches. Broken carts, ploughs, harrows, and hurdles lay in heaps. The carcasses of scores of dead horses had been hastily thrust aside so as to clear a

passage. In a meadow, working by the light of lanterns, gangs of soldiers and peasants were digging long pits; while row after row of prone figures could be glimpsed when the light carried by those directing the operations chanced to fall on them.

Dalroy knew, of course, that all the indications pointed to a successful, if costly, German advance—which was the last thing he had counted on in this remote countryside. If the tide of war was rolling into Belgium, it should, by his reckoning, have passed to the south-west, engulfing the upper valley of the Meuse and the two Luxembourgs perhaps, but leaving untouched the placid land on the frontier of Holland. For a time he feared that Holland, too, was being attacked. Understanding something of German pride, though far as yet from plumbing the depths of German infamy, he imagined that the Teutonic host had burst all barriers, and was bent on making the Rhine a German river from source to sea.

Naturally he did not fail to realise that the lumbering wagon was taking him into a country already securely held by the assailants. There were no guards at the cross-roads, no indications of military precautions. The hospital, the grave-diggers, the successive troops of cavalry, felt themselves safe even in the semi-darkness, and this was the prerogative of a conquering army. In the conditions, he did not regard his life as worth much more than an hour's purchase, and he tortured his wits in vain for some means of freeing the girl, who reposed such implicit confidence in him, from the meshes of a net which he felt to be tightening every minute. He simply dreaded the coming of daylight, heralded already by tints of heliotrope and pink in the eastern sky. Certain undulating contours were becoming suspiciously clear in that part of the horizon. It might be only what Hafiz describes as the false dawn; but, false or true, the new day was at hand. He was on the verge of advising Irene to seek shelter in some remote hovel which their guide could surely recommend, when Fate took control of affairs.

Maertz had now pulled up in obedience to an unusually threatening order from an Uhlan officer whose horse had been incommoded in passing. Above the clatter of hoofs and accoutrements Dalroy's trained ear had detected the sounds of a heavy and continuous cannonade toward the south-west.

'How far are we from Visé?' he asked the driver.

The man pointed with his whip. 'You see that black knob over there?' he said.

'Yes.'

'That's a clump of trees just above the Meuse. Visé lies below it.'

'But how far?'

'Not more than two kilometres.'

Two kilometres! About a mile and a half!

Dalroy was tortured by indecision. 'Shall we be there by daybreak?'

'With luck. I don't know what's been happening here. These damned Germans are swarming all over the place. They must be making for the bridge.'

'What bridge?'

'The bridge across the Meuse, of course. Don't you know these parts?'

'Not very well.'

'I wish I were safe at home; I'd get indoors and stop there,' growled the driver, chirping his team into motion again.

Dalroy's doubts were stilled. Better leave this rustic philosopher to work out their common salvation.

A few hundred yards ahead the road bifurcated. One branch led to Visé, the other to Argenteau. Here was stationed a picket, evidently intended as a guide for the cavalry.

Most fortunately Dalroy read aright the intention of an officer who came forward with an electric torch. 'Lie as flat as you can!' he whispered to Irene. 'If they find us, pretend to be asleep.'

'Hi, you!' cried the officer to Maertz; 'where the devil do you think you're going?'

'To Joos's mill at Visé,' said the gruff Walloon.

'What's in the cart?'

'Oats.'

'*Almachtig!* Where from?'

'Aachen.'

'You just pull ahead into that road there. I'll attend to you and your oats in a minute or two.'

'But can't I push on?'

The officer called to a soldier. 'See that this fellow halts twenty yards up the road,' he said. 'If he stirs then, put your bayonet through him. These Belgian swine don't seem to understand that they are Germans now, and must obey orders.'

The officer, of course, spoke in German, the Walloon in the mixture of Flemish and Low Dutch which forms the *patois* of the district. But each could follow the other's meaning, and the quaking listeners in the middle of the wagon had no difficulty at all in comprehending the gravity of this new peril.

Maertz was swearing softly to himself; they heard him address a question to the sentry when the wagon stopped again. 'Why won't your officer let us go to Visé?' he growled.

'Sheep's head! do as you're told, or it will be bad for you,' was the reply.

The words were hardly out of the soldier's mouth before a string of motor-lorries, heavy vehicles with very powerful engines, thundered up from the rear. The leaders passed without difficulty, as there was plenty of room. But their broad flat tires sucked up clouds of dust, and the moon had sunk behind a wooded height.

One of the hindmost transports, taking too wide a bend, crashed into the wagon. The startled horses plunged, pulled Maertz off his perch, and dragged the wagon into a deep ditch. It fell on its side, and Dalroy and his companion were thrown into a field amid a swirl of laden sacks, some of which burst.

Dalroy was unhurt, and he could only hope that the girl also had escaped injury. Ere he rose he clasped her around the neck and clapped a hand over her mouth lest she should scream. 'Not a word!' he breathed into her ear. 'Can you manage to crawl on all-fours straight on by the side of the hedge? Never mind thorns or nettles. It's our only chance.'

In a few seconds they were free of the hubbub which sprang up around the overturned wagon and the transport, the latter having shattered a wheel. Soon they were able to rise, crouching behind the hedge as they ran. They turned at an angle, and struck off into the country, following the line of another hedge which trended slightly uphill. At a gateway they turned again, moving, as Dalroy calculated, on the general line of the Visé road. A low-roofed shanty loomed up suddenly against the sky. It was just the place to house an outpost, and Dalroy was minded to avoid it, when the lowing of a cow in pain revealed to his trained intelligence the practical certainty that the animal had been left there unattended, and needed milking. Still, he took no unnecessary risks.

'Remain here,' he murmured. 'I'll go ahead and investigate, and return in a minute or so.'

He did not notice that the girl sank beneath the hedge with a suspicious alacrity. He was a man, a fighter, with the hot breath of war in his nostrils. Not yet had he sensed the cruel strain which war places on women. Moreover, his faculties were centred in the task of the moment. The soldier is warned not to take his eyes off the enemy while reloading his rifle, lest the target be lost; similarly, Dalroy knew that concentration was the prime essential of scoutcraft.

Thus he was deaf to the distant thunder of guns, but alive to the least rustle inside the building; blind to certain ominous gleams on the horizon, but quick to detect any moving object close at hand. He made out that a door stood open; so, after a few seconds' pause, he slipped rapidly within, and stood near the wall on the side opposite the hinges. An animal stirred uneasily, and the plaintive lowing ceased. He had dropped the sabots long since, and the lamp was lost in the spill out of the wagon, but most fortunately he had matches in his pocket. He closed the door softly, struck a match, guarding the flame with both hands, and looked round. He found himself in a ramshackle shed, half-barn, half-stable. In a stall was tethered a black-and-white cow, her udder distended with milk. Huddled up against the wall was the

corpse of a woman, an old peasant, whose wizened features had that waxen tint of *camailleu gris* with which, in their illuminated missals of the Middle Ages, the monks loved to portray the sufferings of the early Christian martyrs. She had been stabbed twice through the breast. An overturned pail and milking-stool showed how and where death had surprised her.

The match flickered out, and Dalroy was left in the darkness of the tomb. He had a second match in his hand, and was on the verge of striking it, when he heard a man's voice and the swish of feet through the grass of the pasture without.

'This is the place, Heinrich,' came the words, in guttural German, and breathlessly. Then, with certain foulnesses of expression, the speaker added, 'I'm puffed. That girl fought like a wild cat.'

'She's pretty, too, for a Belgian,' agreed another voice.

'So. But I couldn't put up with her screeching when you told her that a bayonet had stopped her grandam's nagging tongue.'

'Ach, was! What matter, at eighty?'

Dalroy had pulled the door open. Stooping, he sought for and found the milking-stool, a solid article of sound oak. Through a chink he saw two dark forms; glints of the dawn on fixed bayonets showed that the men were carrying their rifles slung. At the door the foremost switched on an electric torch.

'You milk, Heinrich,' he said, 'while I show a glim.'

He advanced a pace, as Dalroy expected he would, so the swing of the stool caught him on the right side of the head, partly on the ear and partly on the rim of his *Pickel-haube*. But his skull was fractured, for all that. Heinrich fared no better, though the torch was shattered on the rough paving of the stable. A thrust floored him, and he fell with a fearsome clatter of accoutrements. A second blow on the temple stilled the startled oath on his lips. Dalroy divested him of the rifle, and stuffed a few clips of cartridges into his own pockets.

Then, ready for any others of a cut-throat crew, he listened. One of the pair on the ground was gasping for breath. The cow began lowing again. That was all. There was neither sight nor sound of Irene, though she must have heard enough to frighten her badly.

'Miss Beresford!' he said, in a sibilant hiss which would carry easily to the point where he had left her. No answer. Nature was still. It was as though inanimate things were awake, but quaking. The breathing of the unnamed German changed abruptly into a gurgling croak. Heinrich had traversed that stage swiftly under the second blow. From the roads came the sharp rattle of horses' feet, the panting of motors. The thud of gun-fire smote the air incessantly. It suggested the monstrous pulse-beat of an

alarmed world. Over a hill-top the beam of a searchlight hovered for an instant, and vanished. Belgium, little Belgium, was in a death-grapple with mighty Germany. Even in her agony she

was crying, 'What of England? Will England help?' Well, one Englishman had lessened by two the swarm of her enemies that night.

(Continued on page 52.)

WORKING DEPTH OF OUR MINES.

By GEORGE H. ASKEW, Mine Manager, Brayton, Cumberland.

HOW deep shall we ever be able to sink our shafts and successfully work our minerals? We already have shafts as deep as about fifteen hundred yards. Will it ever be possible to double that distance? A few years ago a remarkable borehole was sunk at Schladebach, about fifteen miles from Leipzig; and we believe, with one exception perhaps, this is the deepest bore that has ever been made. Though this experiment is of great scientific interest, it was not designed with any scientific object in view. The undertaking was purely a commercial one, and a sum of not less than ten thousand pounds was expended in carrying it out. There was, it may be presumed, reasonable expectation that the great initial cost, and a handsome profit as well, would be returned as the fruits of the enterprise. Whether the experiment was successful from the money-making point of view we do not know, but we do know that it was very successful in the sense that it incidentally afforded scientific information of the very highest value. The bore was undertaken in making a search for coal. Some enterprising capitalists consulted the geologists as to whether coal-seams were to be found in this locality. They were assured coal was there, though it would certainly be a very long way down. The capitalists were not daunted by this consideration, but determined to make a preliminary search by means of a diamond bore. The hole was one mile one hundred and seventeen yards deep, commencing with a diameter of six inches and finishing at a little more than half an inch. It is worth while pondering for a moment on what this distance means. Had the hole been commenced at the top of Ben Nevis, it would have gone down to sea-level and on to twelve hundred feet lower still. When the foreman drew his cores it was necessary at the lower stages to lift and uncouple that tremendous length of rods, a very tedious operation. The collective weight of the working system of rods was about twenty tons, and not less than ten hours' hard work was necessary before the crown was raised from the bottom of the hole to the surface. We may, I think, believe that so much trouble was never before expended on a borehole; but the results are full of information on important problems of science.

The geological results thus obtained of this exploration of the earth's crust are no doubt of very great interest to geologists; but our main

object in writing of this wonderful boring is very different. Its significance will be realised when we say it gave us more full and definite information about the internal heat of the earth than had ever been obtained by any previous experiment. We are under a great obligation to Captain Huyssen, the German engineer who bored this remarkable hole, and who so carefully and exactly took the temperatures at the various depths. The temperatures taken at the various depths in coal-pits are of no value, because we never get the true temperature of the rocks on account of the cooling effect of the air current ventilating the mine. Of course this hole was filled with water which was circulating during boring operations, and temperatures were not then reliable. Captain Huyssen devised an arrangement by which he could place temporary plugs in the hole at any depth he desired. He then determined the temperature of the water in a short length so plugged above and below that the circulation was stopped, and the water thus confined might be relied upon to indicate the temperature of the strata which held it. The thermometer employed in this investigation was ingenious, but particularly simple and more accurate than the ordinary graduated one, being merely a bulb of glass with a slender capillary tube, the top of which was not closed. When it was about to be lowered to the lowest point to which the drill had penetrated, the bulb and stem were filled to the brim with mercury. It was then lowered, and the hole firmly plugged a few feet above it. After being left there for some time it acquired the exact heat of the surrounding rocks, and—of course, due to expansion—a certain amount of mercury exuded from the top of the instrument, yet still leaving it brim-full. The plug being removed, the thermometer was drawn to the surface. Naturally the mercury had contracted until, perhaps, there was none showing in the stem. The instrument was then placed in a basin of cold water, to which hot water was gradually added until the mercury was again on the point of overflowing. A standard thermometer was now placed in the basin, and the correct temperature reached at the bottom of the hole duly recorded. These measurements were taken at about every hundred feet—in all there were fifty-eight recorded—so that the measurements should truly indicate the varying temperatures.

Now it is a scientific fact that at a depth of one hundred feet the earth is unaffected by the heat of the sun. It matters not whether the surface be hot or cold, at midsummer in the tropics or at Christmas at the North Pole, the temperature at that depth all over the earth is constant at fifty-two degrees Fahrenheit. The temperature of the sea at a depth of, say, a mile is also constant, being thirty-one degrees Fahrenheit, or one degree below freezing-point. The study of the internal heat of the earth, therefore, begins at one hundred feet, and it was conclusively proved that there was an increase of one degree for every sixty-six feet—that is, of course, starting from a depth of one hundred feet down to a mile and a quarter. From these readings it will be seen that the temperature of the rocks all over the earth at a depth of one mile is one hundred and thirty-two degrees, and consequently at a depth of two miles two hundred and twelve degrees, or the temperature of boiling water. Imagine that the waters of the ocean were removed from the earth. The ocean is in places more than five miles deep, but the earth's diameter is eight thousand miles. The removal of all this water, for the sake of comparison, would not be greater in proportion than the wiping dry of a wet standard Association football. Then take off a skin of two miles from the earth, which is infinitely less than the peeling of a peach, and what is the result? A temperature of two hundred and twelve degrees beneath our feet. We might be able to breathe the dry air; but what about our boots? Then, when they were gone, what about our feet and bodies? Or let us assume that we do sink a pit two miles deep. If our temperatures at varying depths are correct, it naturally follows that if there is any water at this depth it will be practically at boiling-point, and most certainly will give off large quantities of vapour, which will not only keep the roads from being dry and dusty, but will act very deleteriously on the roof, sides, and floor; and, combined with the heavy pressures, will make it extremely difficult to support and maintain the roadways, even if we are able to see along them. Again, as will be more likely in the majority of supposititious mines at this depth, it is a dry heat which we encounter. What a veritable powder-magazine a coal-mine would be with both coal and rocks so heated that they could not be touched without scorching the flesh! It is also interesting to note the atmospheric pressure at this depth. If the surface barometer gives a reading of thirty inches, at two miles the reading will be forty-two inches, while the pressure per square foot will be two thousand one hundred and twenty pounds and two thousand nine hundred and seventy pounds respectively, an increase of eight hundred and fifty pounds per square foot on all exposed surfaces, and, of course, on each square foot of our anatomy; and a hundred cubic feet

of air weighing about eight pounds at the surface will weigh eleven pounds at a depth of two miles. Under these circumstances, therefore, mining operations at a depth of two miles will be distinctly unpleasant.

I might here enlarge upon the fact that the earth is gradually cooling by radiation; but the process is so very slow that it is more than likely that hundreds, perhaps even thousands, of years will elapse before the temperature at a depth of two miles is reduced even one degree; so that to look forward to the time when mines will be worked at a depth of two miles would be distinctly a waste of time and thought.

Now let us take into consideration another factor in the question—that of the pressure at greater depths than those at present being mined. A column of water thirty feet high gives a pressure of nearly fifteen pounds per square inch; and, taking the average density of rock as three times that of water, ten feet of rock will produce the same pressure as thirty feet of water. Consequently we have at a depth of a mile a pressure of more than three tons to the square inch, at two miles six tons per square inch, while at ten miles the pressure will be very nearly equal to that produced on the walls of a Dreadnought gun when the charge of cordite has been fired to drive the projectile to its destination. Yet ten miles of rock is as nothing compared with the thickness of the rocks producing the pressures of the earth's interior. Even if a shell of ten miles of rock were peeled off the earth it would only reduce the diameter one four-hundredth part; and the temperature of the exposed surface would be eight hundred and fifty-two degrees Fahrenheit.

Let us ask what is the condition of these rocks at their very highest temperature. We know the heat is more than sufficient to melt the most refractory metals, but we must also remember the tremendous pressure exerted by the superincumbent rocks. At Shide, in the Isle of Wight, the late Professor Milne, whose business and hobby it was to discover and record earthquakes, with the help of a most delicate instrument called the seismometer, was able to announce earthquakes, and their locality and magnitude, long before the accounts were published in the newspapers. We will suppose that an earthquake of fairly large proportions has taken place in Japan. About a quarter of an hour afterwards the needle at Shide records the fact. This is the first record, but there are two others. There is an interval of perhaps three-quarters of an hour, and then the second record comes along, which, by the way, is on a much larger scale, although easily identified as a more pronounced edition of the first record; then, after another pause for half an hour or so, the third record is received. This diagram is not quite so strongly marked as the second one, but still stronger than the first. Now to explain why there are three records of the earthquake. When the shock takes place in

Japan it originates a series of vibrations through the earth. The surface vibrations account for the second and third records, one going the short way to the Isle of Wight, and the other taking the longer route. These records are heavy because the surface rocks are pliant, and the second record is heavier than the third on account of having a shorter distance to travel. Now for the first record, because this is of special interest. The shock of the earthquake not only shook the surface rocks of the earth, but it also shook the whole earth, and certain of these vibrations took a direct course right through the globe. With the same velocity they would take a shorter time than the other records, but they really travelled much faster. It has been proved that the average velocity of these vibrations when travelling through the centre of the earth is ten miles a second. The velocity varies with the square root of the depth, and near the surface is not two miles a second. This is proof that the interior of the earth is more rigid than the surface. In other words, under the tremendous internal pressure of the earth's interior, notwithstanding the enormous temperature of its constituents, the earth possesses a rigidity which is practically greater than that of steel.

It seems anomalous, but it is nevertheless true that the deepest pit is the safest place during an earthquake. This reminds us of the story of the sailor who, in a hurricane, remarked, 'I wouldn't care to be ashore to-night, with all the chimney-pots flying about.' In years to come I can imagine the scientific Japanese coal-hewer noticing a slight earthquake shock when at work some hundreds of yards below ground, and thanking his stars that he was not at home and in bed. This, of course, if he were a bachelor; a married man would be very anxious about the safety of his family, and would leave his work in the middle of his shift, hurry to the shaft, and, if the winding-engine were intact, get off home as soon as possible, hoping to find his house standing.

The internal heat and also the tremendous pressures exerted in the earth are strikingly illustrated in the phenomena of volcanoes. We believe that on account of the enormous pressure, and in spite of heat that would liquefy any material of which our earth is composed, the inner portion of our globe is, as has been stated, more solid than the hardest steel. But though this applies to the deep-seated regions, it does not apply universally at moderate depths. When this pressure finds a vent, so to speak, the solid matter liquefies and exudes from the crater of the volcano in the form of lava. Occasionally we have a mighty eruption, such as that at Krakatoa, perhaps the mightiest explosion that has ever occurred on the earth. The small island called Krakatoa is in the East Indian Archipelago. No one lives on it, and until the summer of 1883 it was not distinguished. However, at that time it began to come into

prominence; earthquakes were felt, and deep rumblings from its one volcano were heard. But nothing very serious was anticipated, and a pleasure-party from Batavia took it so lightly that they chartered a steamer and went picnicking on the island. They climbed up the mountain and peeped into the crater, which was about thirty yards wide, and from which vast quantities of steam were rising. As the summer went on the rumblings increased until they could be heard twenty miles away. Still this was nothing, for in the course of a week or two the thunders could be heard for a hundred miles, and also for that distance around the little island daylight was obscured by the dust erupted; it was as dark as midnight all the twenty-four hours of the day. The noises increased all through July, and people were becoming panic-stricken. Then on Sunday, 26th August 1883, came the *dénouement*. At Batavia, one hundred miles away, no one slept that night. The houses trembled with the shocks, and the windows rattled as if heavy artillery were fired at close quarters. This went on all through the night; and then at ten o'clock on Monday, 27th August, the final explosion took place, when a large portion of the island was blown away and scattered to the four winds of heaven. This supreme effort made what was the biggest noise ever heard on this planet. The sounds were heard, some four hours after their occurrence, at Rodriguez, which is approximately three thousand miles away. Of course the difference in time is accounted for by the time taken by sound to travel. It is estimated that in the final effort ten cubic miles of material was blown into the air, and most of this material was projected to a height of twenty miles. The wonderful sunsets in the autumn of 1883 may be remembered. These were caused by the Krakatoan dust which encircled the whole earth. People wrote to the papers from all parts of the globe; the sun looked blue, the moon was veiled in green, and there were curious and unusual halos round the sun and the moon. These different phenomena were observed in many situations and various countries. Moreover—and this is both curious and interesting—the mighty sound was registered even in London quite half-a-dozen times. A sudden shock of such magnitude to our atmosphere must of necessity affect the barometer. The atmospheric wave would start from Krakatoa and travel to the pole opposite to Krakatoa in about thirty-six hours. Then the oscillations, after converging, would again travel back, and so on in gradually fading intensity until they became evanescent; and meteorologists at many stations could anticipate to a few minutes the fluctuations of the barometer due to these atmospheric waves, until the air again became normal.

This practical proving of the condition of the earth's interior leads to the conclusion that even if the difficulties of the heat in mines of a depth of two miles could be overcome, the heavy pres-

asures exerted on the rocks and minerals by those superimposed would render it practically impossible successfully and safely to work seams of coal. At the same time we might note our puny efforts, and once more liken our globe to a regulation Association football. The faintest scratch that a thorn could make on the outer leather covering represents the depth of our deepest mines. What atoms we are in the universe, the earth on which we live no more than a grain of sand on the shore! Consider its insignificance in comparison with our whole system, including the mighty sun, distant from us ninety-three million miles, whose bulk is so great that if it were placed with our earth as the centre its periphery would extend to twice the distance from us to our satellite, which is two hundred thousand miles away, the diameter of the sun being eight hundred and sixty-six thousand miles. Again, consider that the glorious orb of light is surrounded by hundreds of planets,

many larger than our earth, and many not more than ten miles in diameter, yet each one making its regular journey round its primary, those journeys varying in time from eighty-eight days in the case of the nearest, Mercury, to one hundred and sixty-five years, which is the time taken by the mighty Neptune to complete the four seasons of his year. Then consider that there are many millions of suns, the majority of which are considerably greater than our own source of light and life; and, assuming that each of these glowing bodies is attended by a galaxy of planets similar to this old world of ours, there are undoubtedly hundreds of millions of dark bodies in the illimitable universe. In view of our littleness in the world of space, the thousands of miners at work picking away are unable to do more than make the faintest scratch on a football in this which is called, so far as science, invention, and research are concerned, the most wonderful century of man's life on this earth.

THE BRAVEST OF THEM ALL.

CHAPTER III.

JACKIE was fully convinced that the burglar was now dead, and that he had killed him; and you won't be surprised to learn that drops of water fell from his eyes almost rivalling in size those falling from the thunder-clouds outside.

At length, the thunder and rain ceasing, and a patch of blue appearing in the sky, he went outside and sat disconsolately on the hall step. He dared not go anywhere near the bathroom. The rain had caused the lines of his neat time-chart to run into one meaningless blur. He didn't mind; time was nothing to him now. When you have——

But at this moment something appeared over the edge of the moor, steadied itself there a moment, and then began cautiously to descend the long slope. The squatting figure gazed at the thing intently. Yes, there was no doubt about it, the car was coming back, feeling its way gingerly along the road for fear of side-slips.

He waited till it had entered the drive, and then, rising wearily, walked with dragging steps to meet the party.

It was Aunt Christine who alighted first. She came toward him in her usual bright, cheery way, both hands outstretched. 'Well, Jackie dear, here we are at last. The shower'—— Then, as she caught sight of certain tell-tale stains on the face of the Guard, her voice took on a sympathetic tone. 'Why, boyveen, were you frightened?'

'Uncle T-t-tom,' said Jackie, turning to the driver of the car, 'th-th-there's a b-b-burg'——

'Steady, sonny—steady!' commanded Uncle Tom. 'Tention!'

And that steadied Jackie for a moment. He straightened himself and put his heels together, and tried his hardest not to stammer.

'Uncle Tom, there's a b-burglar in the b-bathroom, an'—an'—an'—he's—DEAD!' he finished in a high crescendo; and at that the Guard broke down completely, and fell, sobbing, into the arms of Aunt Christine.

'Great Scott!' cried Uncle Tom, looking rather uncomfortable, especially when Aunt Christine turned to him and said, quite sharply for her, 'I told you we ought never to have left him!'

Then she patted the heaving back and stroked the hair of the 'only just,' and let him sob his fill against her motherly bosom, whilst Cousin Madge stood by, needing very little encouragement to sob in unison.

'What frightened you, Jackie?' she asked gently, after a moment or two.

'He did! The b-burglar!' came in muffled, broken accents. 'The thunder, I think. I don't know.' The tousled head was raised, and the tear-stricken face turned to meet the loving looks bent toward it. 'An' he's dead, Aunt Christine!' came in an awe-stricken whisper, the hazel eyes opened widely.

'Tell me, sonny,' began Uncle Tom.

'Wait a moment, Tom; wait a moment,' said Aunt Christine. 'The heat has been too much for him;' and she stroked the smooth brow, and took two hot brown hands in her own cool white ones.—'Now let us go in and have a nice sensible tea. How would "bully" do, and brown biscuits?'

Madge brightened perceptibly at this, but it

had no effect on the Guard. How could one enjoy 'bully' with dead burglars lying around?

Arrived in the dining-room, Uncle Tom caught sight of the half-emptied pickle-jar.

'Ha! ha!' he cried, laughing. 'I see it all now, Jackie! Too much pickle has upset some one's stom'—

'He took them, Uncle Tom.'

'He? What he?'

'The b-burglar.'

'Took'—

But just then Aunt Christine's voice was heard calling excitedly from the kitchen.

'Come here, Tom, quickly!' she cried.

And of course, when Uncle Tom joined her, you know what he found: the sodden clothes hung on chair-backs in front of what had been a fire in the morning, but was now nothing but ashes; and on the dresser the array of iron-mongery taken from the burglar's pockets.

Jackie joined them there, followed closely by Cousin Madge.

'Sonny,' asked Uncle Tom quietly, 'can you tell us about these things now?'

'They belong to the burglar, uncle.'

'But where is the burglar?'

'In the bathroom. But he's dead!'

'Dead! But what made him die?'

'I did, uncle. I drowned him.'

Aunt Christine again looked into the hazel eyes and felt the hot hands, whilst Uncle Tom scratched his left ear.

'Wait a moment till I get my revolver,' he said, 'and then we'll go to the bathroom.'

'Sonny,' he asked when he came back again, 'is the door locked?'

'No, uncle; it's bolted on the outside.'

So they all walked down the passage to the bathroom, Uncle Tom and Aunt Christine leading, whilst Jackie followed closely behind, Cousin Madge, drawn on by a fearful fascination, creeping along some distance in the rear.

'Why, the steps are all wet!' cried Uncle Tom when he had reached the end of the passage.

'Yes, uncle,' Jackie replied wearily. It seemed hardly worth while explaining that no self-respecting burglar could be 'drowned' in a mere six inches of water.

Then Uncle Tom, shooting back the bolt, threw open the door, and—yes, there was no doubt of it—a prone figure, covered with a rug, could be seen huddled in the far corner.

A gentle hand stretched out and drew the trembling Jackie close to its owner, a reassuring arm passed round his shoulder.

Uncle Tom stepped across to the figure and touched a protruding bare foot. Then he gave a glad shout and shook that foot as if it were a door-knocker. 'It's all right,' he called out; 'he's only asleep.—Here! wake up! wake up!' and he shook till the foot almost came off in his hand.

At this the burglar stirred, grunted, opened his eyes, saw the glistening barrel of the revolver Uncle Tom held so steadily toward him, and sat up hurriedly.

'Uncle Tom, eh?' he growled. 'All right, boss. I'll give no trouble. But turn that nasty thing away. It might go off without yer knowin'.'

'You seem to have been enjoying yourself,' said Uncle Tom.

'Enjoy'—began the burglar bitterly, suddenly spreading out his arms and disarranging the rug so much that—

'Come away, Madge dear! Come away!' commanded Aunt Christine. 'Let us go and make tea.'

I need not trouble you with the long explanations the burglar made, nor the surprised and keen questionings from Uncle Tom, nor the supplementary information added by the now radiant Jackie.

Only, when the explanations and questionings came to an end, Uncle Tom bolted the burglar in again, returning to the bathroom soon after, carrying a bundle of strangely assorted garments. Arrayed in these, the burglar, now very crest-fallen indeed, was then escorted to the toolhouse at the bottom of the garden, and securely locked in for the night.

And what an hour of triumph was Jackie's at tea-time! He had to tell it all over again to Aunt Christine and Cousin Madge, Uncle Tom keeping him plentifully supplied with 'bully.'

I can't stay to explain exactly what 'bully' is; but you require jam (lots of it), and thick cream (lots of that also), and a stom—— at least the digestion of a small boy. Only, don't forget the brown biscuits.

Truth to tell, Cousin Madge hardly knew she was eating 'bully'; she would sit a long time with a spoonful of it half-way between her plate and her mouth, her eyes glued to Jackie's radiant face. Once her spoon fell, and it had a lot of 'bully' on it; and whilst the spoon fell on her plate the 'bully' dropped on the white tablecloth. But Aunt Christine never noticed it, for, truth to tell, she also had her eyes riveted on Jackie, her lips were parted, and her breath coming and going quickly.

A somewhat timid knock was heard on the studio door that evening as Uncle Tom was just finishing his after-dinner cigar.

'Come in!'

The door opened, and Jackie advanced three steps into the room and stood to attention.

'Good-night, uncle!' he said.

Then a marvellous thing happened. Uncle Tom sprang from his chair, walked across the room till he was close to Jackie, then stood to attention himself, and raised his hand with a quick sweep to his forehead. 'Sir,' he said, 'I salute you. You're the bravest Scout I've ever known.'

Jackie's eyes glistened, and his breath came in little gasps. Had he heard aright? 'Do you mean it, Uncle Tom?' and the hazel eyes were raised pleadingly.

'Mean it, sonny? Indeed I do,' and here Uncle Tom fairly hugged Jackie; 'a thousand times over I mean it. YOU'RE THE BRAVEST OF THEM ALL.'

And I wish I could show you the shine that came into Jackie's face, and the way his eyes fairly glittered. 'The bravest of them all!' His heart was too full to speak, so he turned away without another word; and no Scout ever walked to bed with a straighter or stiffer back than Jackie, 'the bravest of them all.' And the last thing he saw in the studio as he walked away was the Girl-on-the-Canvas, and her lips seemed to smile and say, 'Well done, our side!'

That is really all I have to tell you about Jackie, and, properly speaking, I should now stop. But as I know you would like to hear what became of the burglar, I will add a few more lines.

After Fred had taken the burglar his supper, Uncle Tom came down from the studio and walked across the garden to the toolhouse. He found the burglar sitting on an upturned hamper, in front of a packing-case which had served him as a table. He seemed very dejected, but perhaps this was partly due to his ill-fitting and poorly matched clothes.

'Feeling pretty fit now?' asked Uncle Tom kindly, for he really felt sorry for the hunched-up figure on the hamper.

'Yes, boss,' the burglar grunted.

'Try a smoke;' and Uncle Tom held a cigar out to him, which the burglar took without a word of thanks. He bit off the end, spat it out, and then lighted up from the box Uncle Tom pushed across the packing-case to him. He puffed away for a moment or two; then, 'S'pose this'll be a five year job, boss?' he asked gloomily.

'Yes, I suppose so,' Uncle Tom replied with equal gloom.

The burglar sighed, shrugged his shoulders, and smoked on in silence.

'Look 'ere, gov'nor,' he said at last, 'that little nipper o' yourn'—puff! puff!—'cipher my eyes, but 'e's a prize lot!'

'Yes,' said Uncle Tom, 'he's pretty smart.'

'Smart! May I be fractioned if I ever see 'is like! The way 'e diddled me an' got me in the bath—*b-r-r-r*! I can't think o' that bath yet!'

'You see, the little chap's a Scout'—oh, Uncle Tom! and Jackie 'only just'—'and that makes him smart.'

'One o' them Boy Scouts! I didn't think they took 'em so small.' The burglar smoked away quietly for a little time; then, in a much gentler and softer voice, he said, 'Ad a little nipper myself wanst.'

'Yes?' from Uncle Tom sympathetically.

'E were about that 'igh;' and the burglar held the palm of his hand just below the level of the top of the packing-case. He kept his hand at that level whilst he went on speaking. Perhaps—who knows?—he saw the little nipper as he spoke. 'The questions that pinch o' a chap used to ask fair floored me. Used to wonder where the cipher 'e got 'em from. Blue eyes 'e 'ad, an' cur'— Puff! puff! puff! spit! Then he wagged his head as if his coat were a bit tight at the throat.

Uncle Tom leaned against a bench and looked at the burglar thoughtfully. Uncle Tom was doing some hard thinking, and he could think well, could Uncle Tom, though he usually said he found the labour of it far too exhausting.

The burglar smoked in silence for a few moments. His eyes had a far-away look in them, as if he were still gazing at the little nipper with the 'blue eyes an' cur'—

'Yes, this is a five year job, gov'nor, as you say.' Puff! 'But I'm through with burclin'.' Puff! puff! 'W'en I was clawin' that every wall like a 'alf-drowned fly, expectin' every moment the water'd wallop down my throat, an' finish me off complete'—puff! puff! puff!—'mind, it's gawspel truth I'm tellin' ye!'—puff!—'I saw that little nipper I spoke on.' Puff! puff! 'E come to the winder an' looked down at me; an' 'is bit o' a face seemed sad like!' Puff! 'I'm through wi' burclin'.' Spit with great violence.

As Uncle Tom had nothing to say to this, he just told the burglar, in a kindly tone, to make himself as comfortable as he could for the night, and then, locking the door securely, left him to his own thoughts.

Before breakfast next morning Fred had motored down to Minsterton for a constable. The one deputed to attend to Uncle Tom's complaint looked very consequential and vastly important as he sat bolt-upright in the returning car.

When he was announced, Uncle Tom first interviewed him in the dining-room. They had a long talk; and when they slowly strolled down the garden toward the toolhouse the constable thoughtfully turned over certain coins in his right-hand trousers pocket, coins which rattled with a pleasing jingle.

Uncle Tom threw open the toolhouse door and looked at the burglar very severely.

'Um!' said the constable; 'so this is the man you found here this morning, sir?'

'Yes,' said Uncle Tom; 'I found him here at six o'clock.' But he forgot to mention, did Uncle Tom, that when he 'found' him he carried in his hand a plate of bread and meat. Indeed, crumbs of both were even then on the top of the packing-case, as the constable might have seen but for those coins in his right trousers pocket.

When Uncle Tom spoke the burglar shot a

quick look at him, and sat up in a hopeful sort of way.

'What's your name, my lad?' the constable asked, in the grand manner of a 'special' at least.

'John Smith.'

'And where do you live?'

'Anyw'eres.'

'Ah! trampin' it, I suppose?'

'Seemin'ly.'

'Why didn't you go on to Minsterton, to the work'ouse?'

'Beat up. Dog tired,' said the burglar, with a great yawn.

'I hear, constable,' said Uncle Tom, with a sly look at the burglar, 'that tramps have to take a bath now before they are relieved.'

The burglar shifted uneasily on his hamper. Society was getting very complicated.

'That's so,' admitted the constable reluctantly.

'But, mind you, I don't hold with it. It's both *un-Christian* and *un-natural*.'

The burglar gave a sympathetic grunt.

'What did you say?'

'Naught.'

'Well,' the constable continued, 'I suppose you'll come along quietly?'

'Oh yes, I'll come.'

'You won't try to make a bolt, Smith?' Uncle Tom asked with a meaning look.

'Fraction my bones if I do, sir,' the burglar growled.

'Very well, constable; take him with you, and I'll be at the court when the case comes on.'

Later in the morning 'John Smith' was brought before the Minsterton magistrates, charged with being found, unlawfully, in the toolhouse of Mallam Tower.

He stood with several other gentlemen and one or two ladies, a sad, depressed-looking company, each individual member appearing as if he or she had enjoyed themselves not wisely but too well at yesterday's fair.

'Now, constable, what's this case?' asked the

chairman of the Bench when John Smith's turn came.

'Loiterin', yer Waship;' and the constable explained the circumstances.

'Um! an ordinary tramp, I suppose?'

'Yes, yer Waship,' said the constable, thoughtfully fingering in his pockets.

One of the junior magistrates leaned forward and took a keen look at John Smith. 'He seems very clean for a tramp,' he remarked.

John Smith muttered something almost inaudible.

'What does he say, constable?' the chairman asked.

'Says it's his natural colour, yer Waship.'

'Perhaps he's been bathed,' suggested a member of the Bench; at which the Court laughed and the prisoner shuffled his feet uneasily.

'Is he known about here?'

'No, yer Waship.'

'Anything in his pockets? You searched him, I suppose?'

'Yes, yer Waship. Piece o' string, some dried peas, stump o' cigar' (produced).

'You don't identify the cigar, I suppose?' the magistrate asked Uncle Tom with a smile.

'No, your Worship. One cigar-stump is very like another.'

The magistrates whispered together for a few moments. Then, 'Now look here, my man,' said the elderly chairman, 'you mustn't come loitering and tramping here.' He turned to Uncle Tom. 'You don't wish to press the case, I suppose, sir?'

'No, your Worship.'

'Very well, then, Smith. We will dismiss you with a caution. But don't be brought up again, or else something worse will happen to you.—Take him away.'

'All right, gov'nor. I'll turn honest. Cipher my eyes if I don't! Burg'—

But here the constable hustled him out of the court, for fear indiscreet admissions might lead to awkward questions.

THE END.

THE GREAT ENCYCLOPÆDIA OF CHINA.

ATTENTION has been drawn in the *Times* to the fact that Mr Wilfred Merton lent to the London Library for a few weeks a volume containing two sections of the famous Chinese Encyclopædia, which he had picked up for a small sum in the shop of a London firm of booksellers. The volume, which had been bound by Miss Katharine Adams, of the Eadburgha Bindery, Broadway, Worcestershire, comprised sections nineteen thousand eight hundred and sixty-five and nineteen thousand eight hundred and sixty-six of the work, and dealt chiefly with the subject of bamboos. As pointed out by Professor H. A. Giles in the

Nineteenth Century for 1901, the complete work comprises twenty-two thousand eight hundred and seventy-seven separate sections, bound up into eleven thousand one hundred volumes, each half-an-inch in thickness; so that, were all the volumes laid flat one upon another, the column thus formed would reach a height of four hundred and sixty-two feet, or fifty-eight feet higher than the top of St Paul's. This great Encyclopædia of China, the *Yung Lo Ta Tien*, produced at Nanking in 1408, easily ranks as the biggest literary undertaking in the world, over two thousand scholars having been engaged in its

compilation, and it contained a total of nine hundred and seventeen thousand four hundred and eighty pages, and three hundred and sixty-six million nine hundred and ninety-two thousand characters. A few years ago there still existed in manuscript a copy of this encyclopædia, which, on account of the enormous expense involved, was never printed. A complete copy was made in 1567, and stored in the Hanlin College in Peking, until destroyed by fire in 1900. Only about one hundred volumes of this copy are known to have been saved, of which sixty are in the Library of the Ministry of Public Instruc-

tion at Peking. Our British Museum has five, and the Bodleian seven, none of them consecutive. Amongst the seventeen thousand volumes of Chinese literature presented to the Bodleian Library, Oxford, by Mr E. Backhouse, Professor of Chinese at King's College, London, are several encyclopædias, or parts of them, including some volumes of the above-mentioned work. One is a reprint from an encyclopædia which was in five thousand and twenty volumes. This handier edition, executed in Shanghai twenty-five years ago, is in one thousand six hundred and twenty volumes.

THE DEATH OF A FATHER.

By JOSEPHINE CALINA.

JAN ZAREMBA from Uranov held a high reputation in the village as an extremely clever man. Every peasant knew that he could read the newspapers, and that he possessed a large number of books. His fine house, with its beautiful veranda, and his old mill on the wooded hillside opposite, called forth a still greater degree of respect from his poorer neighbours. Sometimes they compared his house to a king's palace.

When the war broke out Jan Zaremba became more important than ever. Every one regarded him as the one person who knew all about the war, because of his books and of his reputed wisdom. Whenever any of the peasants chanced to meet him he would be saluted with a low bow, and asked at once, 'Oh sir, it is a bad war! Will it last long? Could the Germans come to Uranov?' To which he would answer, hurriedly and brusquely, 'Nonsense, nonsense! Everything will be all right soon,' and would walk away. Such an answer from Zaremba was sufficient to make the village cheer up for several days, and not worry about the war. To every one he gave the same sure answer, so that all went away from him with light hearts. He was very proud of his knowledge. He never opened a book to read, but he loved the nice covers of his books with the golden edges and the silk ribbons between the pages. If he had any visitors, he liked to bring them near to his books, and liked to tell them whence every book had come, walking round the room proudly, and curling his moustache. Smiling, he would say, 'Now you know who I am, eh? I got all these because I like books, and I shall get more and more when my son Jeronim grows older, so that he shall have something good to look at.' The people gazed at him with respect and reverence, marvelling at the depth of his knowledge.

On Sunday morning he used to put on his best clothes, wax his moustache, and go from his house, looking back to admire his veranda,

and as he went giving instructions to his old servant to chain up the dog, to scatter sand outside the door, and so on, until his house disappeared from sight. As he entered the church every one looked at him. He stared round proudly, and knelt down with a serious expression.

Coming out of the church, he was surrounded by groups of peasants, asking him all about the war. 'Oh sir, tell us! You know so much. Nobody seems to know, and we all wait until Sunday to hear what you will say. Tell us, sir, when will the war be finished, and who is going to win?'

Jan Zaremba would look round the crowd of people, straighten his moustache, and say, 'You thick-heads! Read the papers and you will know everything.'

'But, sir, we cannot read; we are not so clever as to be able to read newspapers. But you, sir—you have lots of books with red and green covers edged with gold, and you are one who can tell all.'

'That is all right,' Zaremba would say, with a smile, and proud of his knowledge. 'The war is far from Uranov; no one thinks about Uranov. No one will come here;' and, raising his hat, he would turn homeward. On the way home he thought how foolish they were, only wanting to be told. He reflected how little he could in reality tell them, and he felt annoyed with himself and with the world.

That same afternoon the priest of the neighbouring church came to him and told him that the Germans were on their way to Uranov. Zaremba felt annoyed at the suggestion, and answered sharply, 'No Germans will come here. It is all nonsense,' hiding his embarrassment by placing on the table a bottle of wine, which the priest promptly swallowed, complaining that he was feeling the heat. Zaremba felt oppressed, and did not speak overmuch, hoping that the priest would go away and leave him time to think over matters. When the priest again

started theorising about the war, Zaremba rose from his place and nervously asked him if he desired more wine. Not long after the priest left with a red, sad face, making desperate efforts to keep a straight line.

After the priest left, Zaremba sank down broken. He began to think of his past: of his young days, of his searching for happiness. He remembered how he first came to Uranov, and there married Wanda, a rich young girl, with whom he had found happiness and prosperity, but who had died in giving birth to a son, who, like her, was pale and always ill. People had said that she died of consumption. He let these thoughts and others carry him far away, until his attention was arrested by a paper lying on the table with its huge headlines, 'WAR.' He lifted it up and attempted to read, but his old eyes could not follow the print; the letters jumped like living things before him—War! War! War! What was the war? Why had the Kaiser invented it? The Devil take him! And Zaremba, in a temper, called to his son from a side-door. A boy of sixteen entered, ill-looking, pale, and with large, sad gray eyes. His father looked at him sadly. The boy was a consumptive, and Zaremba knew that he too, like his mother, must die soon. A strong desire came over him to pray for the life of Jeronim.

'Read this, Jeronim,' he said, holding out the paper in his outstretched hand.

The son read that the Germans had already taken Plock, and were on their way toward Uranov.

'You lie!' shouted Zaremba.

'But it is so in the paper,' replied Jeronim.

'Everything is not true which is printed,' said Zaremba, losing his temper more and more. 'Leave this room. Do not tell me any more nonsense.'

An hour later he called his son in again; and, seeing the death-pale face and the laboured breathing, 'Oh Jeronim, are you feeling worse?' he asked.

'Yes, father; I must die soon, I think.'

Zaremba could hardly bear to look at this his only son. Jeronim must not die, his life was so precious to him. 'I did not ask you when you were going to die,' said he. 'Why do you speak about it?'

The evening was gray and gloomy. The sky hung over the trees like a filthy old rag. The rain beat against the windows. Presently the old servant entered the room and lit the lamp. As she looked at Zaremba and Jeronim she gave a deep sigh.

'What is it?' asked Zaremba.

'All the people are leaving the village,' she replied. 'Michalko, Kasnizka, Chaslav—they have all gone away. The Germans are near. Oh sir, let us go away; please let us go too.'

'You silly old thing, can't you see that Jeronim is ill? It would be impossible to take

him anywhere in this terrible weather. You silly old woman! I will wrap him up warmly.' Then, as she still hesitated, 'Where is your place, old silly?' he asked.

'In the kitchen, sir,' she replied.

'Go to your place, then, quick.' The servant left the room.—'Jeronim,' said Zaremba, 'bring the Bible and read to me.'

'Where shall I read, father?'

'Anywhere.'

The wind grew stronger, talking and crying like a living voice. Suddenly, 'Stop reading,' commanded Zaremba. 'Some one is coming. Do you not hear horses galloping over the wooden bridge?' Germans! he thought. Who were the Germans? What harm could they do to his poor ill Jeronim? Oh no, it could not be, that people should kill each other for nothing. No, no, never!

Some one is near, quite near; horses, jingling of spurs, and voices in the darkness of the night.

Zaremba rose from his place and went to the door. 'Who is there?' he asked.

'Open. We are not Germans,' came a voice from without.

Zaremba opened the door.

A young officer entered, tired and pale; he looked like Jeronim. He gazed round with nervous eyes, and then turned to Zaremba, saying, 'The mill on the top of the hill is yours?'

'Yes.'

The officer put his hand on Zaremba's shoulder. 'The Germans are following us. My Cossacks will come and entrench themselves around your mill. Are you honest?'

Zaremba raised his head proudly. 'For such a question at another time you would have had to pay dear, sir.'

'Be serious,' said the officer. 'Now is not the time to be offended at such questions. Listen to what I tell you. Whenever you hear the Germans coming you will set fire to the mill. I know it is dangerous; but'—

Zaremba's head hung down on his breast and tears filled his eyes. In a moment he saw the old mill, with its trees, where he had spent all his young days.

'Old man,' said the officer, 'the mill must burn!'

Zaremba woke from his thoughts. 'Oh yes,' he said; 'my mill will burn, I promise you.'

The officer and his soldiers left. Again could be heard the howling wind in the darkness of the night. Zaremba walked into the house, thinking of his son. Suddenly he heard something like the distant noise of thunder. He listened for a moment, and then went to the door, calling the old servant. He handed her matches and said, 'Take a glass of paraffin; go to the mill and set fire to it. You understand? We must burn our old mill. See that the fire

is bright; and when it begins to burn, jump away if you fear death.'

The servant gazed at him with terrified eyes. 'No, no, sir, I cannot! Burn our old mill! Why? Oh, I cannot!'

'Not a word,' said Zaremba. 'Go! The mill must burn, you understand? It must burn.'

The old servant went out, sobbing and whispering, 'Oh Christ in heaven, in my old age!'

A moment later a loud voice sounded outside. 'Halt!'

Zaremba sat with his back to the door as if he had just been reading the Bible. Even when he heard soldiers approaching with their jingling spurs he did not move. Some one entered the room and rapped out a question. Still he did not answer, but made a sign that he spoke nothing but Polish. A soldier then began questioning him in that language. Zaremba rose from his seat, and, looking the man full in the face, remarked, 'Christians entering a room must remove their hats.'

There were six soldiers in the room, and all took off their hats. One of them approached, and, holding out his hand, said, 'Let me introduce myself.' His face was stained with blood, and his eyes were burning.

Zaremba placed his hand in his pocket, and replied, 'I do not know you. You have all entered my house without permission. I do not wish to know you. My name is Jan Zaremba, and all the property you see around belongs to me. That is all I can say.'

'Have the Russians been here just now?' the man asked. 'And where have they gone?'

'Tell the truth,' said an officer at the doorway, 'or else you will be shot.'

Zaremba went back a few steps and looked at the officer. 'You brute!' he said. 'I have never told lies in my life.'

'That means you know where the Russians are?'

'I know.'

'You do not wish to tell?'

'No.'

'If you do not choose to tell me within the space of ten minutes where the Russians have gone, you will be shot.'

Zaremba looked up and repeated, 'Ten minutes! Ten minutes! That is enough.' Then turning to the officer, he said, 'I despise your words. Maybe in ten minutes you will know where the Russians are.'

Just at that moment Jeronim came from the next room, excited, pale, with blood upon his lips. The soldiers had frightened him, and had brought on another attack. 'Father, what is it?'

'Nothing, Jeronim; nothing. You see the officers have come.'

'Is that your son? We will give a treat to your son too if you will not tell us what we want;' and the officer laid his watch upon the table.

The door flew open and a soldier rushed in and said something to the officer. In a moment the sky had become red, and flames rose past the window. Zaremba remained standing in his old position, watching with a smile the flames of his old mill.

The officer leapt from his seat, saying fiercely, 'You have done your work. Now it is my turn. Make yourself ready and come.'

A fever entered into Zaremba's body, and in a trembling voice he asked, 'And he?'

'And he too,' replied the officer coldly.

Zaremba turned to his son. 'We shall have to go for a little walk with this officer into the garden.'

'It is not far, is it?' asked Jeronim.

The officer, with his wild face, replied, laughing, 'No, not far—only to the nearest wall.'

'Jeronim, put on your coat; it is very wet outside. And put on your goloshes; you might catch a cold.' Zaremba chattered on: 'Put on your warm things, Jeronim; it is very cold. God is angry, and He has sent us a cold wind, howling and crying. Now then, come, Jeronim. Be careful; here is some deep water. Do not get wet, Jeronim. You see, Jeronim, you see, we must stand against this wall, and the officer, the Major—I think that is the right title—— You see, we must stand near this first wall, and the officer is going to show us a very interesting exercise.'

'Father, will they kill us?'

'Oh no, my little coward. You see that line of soldiers? They are preparing to show us something very interesting. Now, Jeronim, shut your eyes, and when you open them you will see something very nice.'

'Fire!' commanded the officer; and Zaremba, embracing his son, fell to the ground with his last words on his lips, 'So, my son, that is all—that is all, Jeronim.'

GOOD IN EVERYTHING.

LIGHT from a thousand stars
Makes bright night's gloom;
Love from a thousand hearts
Keeps life atune.

Songs from a thousand birds
Rejoice the heart;
The thought of thousands' woes
Makes tear-drops start.

The fall of thousands brave
Should teach us all
That this life's thousand cares
To duty call.

Then, if we do our best
This call to heed,
He who has promised will
'Supply our need.'

And when this life is o'er,
Then we may rest
For ages evermore
With 'Well done' blest.

HELEN S. PALMER.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THERE are men and women who have been seeking to know a little more of Britain than they knew before, and, in the most wrackful times that have come upon them have learned more of it in one set of seasons than they might have understood in the haphazard, careless ways of life in two generations. They know how fine and pure is the soul of Britain, how always truly beats its heart for the noble cause. For all its blunders—and they are far too many—they do know that Britain always means well. The whole world has come to understand that spiritual truth as never before. Daily we read in the newspapers what other countries say and think of us—the hatred of the Germans, the compliments of our sister France, the occasional admiration of the Americans. Many of these comments leave us cold, unmoved. At their best they are ephemeral things, flashes of but a moment's fancy, with slight convictions at their base; and at their worst they do not trouble us. But of the thousands of them that one has glanced upon with an occasional gentle curiosity, there is none that is so well remembered and seems so much worth the effort of memory as one contained in a long letter sent by a Polish writer of some repute to a German periodical published in Munich. It was given a disparaging heading in the journal, and surrounded by some harsh comments; but the wonder is that it was reproduced in any form whatsoever. Professor Karl Muth sent to this review an article, consisting mainly of this long letter, with some disparaging comments of his own. It was a letter from M. Vincenty Lutoslawski, one who for many years had attended German universities, and had an excellent knowledge of the country and its people. We shall pass over the terrible denunciation of Germany that is contained in this epistle, the scorn and contempt that the Pole, writing to the Bavarian savant, heaps upon her, the ridicule with which he treats her pretensions to be the sovereign State of the entire world. Let us pass by such a grim warning to the Prussians as that the German army itself, as the German Parliament before it, having broken all the natural laws of mankind, the punishment and atonement must be terrible; that for a century the entire income

of Germany will be needed to pay for the damage done to Belgium, France, and Poland; that five milliards sterling will scarcely suffice; that in order to atone for the destruction caused among innocent populations several generations in Germany must toil ceaselessly and hard for the benefit of the sufferers. But what is more significant than such censure is the tribute paid to Britain. He said: 'There is no longer any world dominion among the human race. The Germans least of all are fitted to rule other peoples, for they never understand them. They have never won the affection of either Poles or Herreros, and the unanimity with which all the inhabitants of the British Empire have taken up arms would have been impossible in a German-ruled empire. A world empire such as the British is a work of God. Treitschke and his pupils imagined a German Empire could be created with weapons, lies, and violence. That is quite impossible. The British Empire was not created by human plans. It will dissolve only when every section of it is ripe for independence. But no other nation on earth can destroy the British Empire, for it is necessary for the defence of the liberty of the world.'

* * *

There is another view to be taken of the discovery of Britain. Along with realising what the heart of the nation is like—the goodness of it—men and women have come to take a better interest in their own country in a hundred ways than they used to do. They have found that the hills and dales of England have not equals of their kind; that no countryside bears on its bosom such charms of exquisite natural simplicity. There is the green of the fields and the woods, the smell of moist earth, the bends of the lanes, the curling banks of clouds in different lights of gray, and the rippling murmur of the streams. None of these things of England has its match in the world away. Imagine now a peasant's cottage at the foot of a hill or on the edge of a wood, on a still, moist day of winter, when boughs are bare and there is the not unpleasant smell of dank masses of the leaves that served in the season gone; some animals that move slowly, listlessly in the meadows, as if they, with nature, were tired and would rest awhile; and the labouring-man, the worker of the farm, who

tramps along as if he walked through a silenced world. To give the inspiring touch to the scene, see the gray smoke rising from the cottage chimney—smoke from a fire of wood, as you can see—rising slowly in a straight thin line through the moistened air. Such a scene is reproduced exactly in thousands of nooks and corners of our islands, and for its natural charm, its magnificent simplicity, it has not its equal in the hemispheres. Some of our men and women have been finding out these things in these latter days, and they have wondered. They who must have waters have gone to Bath and places of such kind instead of to Wiesbaden and Carlsbad, and they also have wondered. There is a beautiful picture in one of our London galleries of a scene in spring-time in the Austrian Tyrol. It has a splendid charm, which seems to lie chiefly in its suggestion of the beauty of natural simplicity, hills and fields and flowers, and it has seduced many wanderers at holiday-times to the farther parts of Europe; yet England, Scotland, and Ireland show better beauty in nearly every county. Again, men and women of these islands go to distant lands in pursuit of some affectation of interest in the places and scenes of great historical events. They will make long journeys from foreign capitals, and will read many metres of printed matter about the facts and dates of these affairs; will persuade themselves, a little hypocritically, that they are concerned; and will make themselves profoundly miserable. However, human nature being still what it has always been, abounding in fantastic conceits, such traits will continue in the characters of peoples; and even after the war is done the Briton who has thought it thorough of himself when one time in France to plod along to Poitiers will continue in search of foreign history—though now he will find more of Britain abroad than ever his forebears did. The wanderer in Europe in days that are coming on will feel in his spirit as he moves from place to place the sad and glorious and wondrous truth that Rupert Brooke before he died expressed in lines of immortal sweetness:

If I should die, think only this of me:

That there's some corner of a foreign field

That is for ever England. There shall be

In that rich earth a richer dust concealed;

A dust whom England bore, shaped, made aware,

Gave once her flowers to love, her ways to roam,

A body of England's, breathing English air,

Washed by the rivers, blest by suns of home.

May not that part of a beautiful sonnet, written by a poet who died at the Dardanelles ere the gloomy tragedy of eastern Europe had begun to unfold itself, be looked upon for ages on as something like a hymn of consecration, of Britain giving herself, with her New Armies and her awakened spirit, to the Europe uprisen for civilisation? The peoples who believed in the soul and in the good future of humanity made

for themselves a community of interests and of territory, and great spaces of Europe, by the blood that has flowed upon them and the graves of heroes that they bear, have been made 'for ever England.' Had that young singer's life yielded nothing more in verse than the first three lines of such a sonnet, surely they were enough to achieve for him continual remembrance, so perfect and so timely is the thought expressed, so beautiful the simple words. But if it is the greatest history, this is new, and old pages will maintain their antique charm. Agincourt, Poitiers will still not be neglected; the field of Waterloo, presenting, as it does, pictures and plans of strategy that are embraced within small compass and are more understandable than the war country of the Aisne will ever be, will surely maintain its attraction. For Waterloo was the last of the great battles that were real and properly human, of the old style of war. By all means, then, when we are next in Brussels let us go out with some of our friends the Belgians, happy at home again, to Waterloo. But we have been thinking of home, of England, of its sweetness and interest, of the little that we have known of it, and the more we are coming to know in the stress of peril and the sharpening of feeling and perception that accompanies it. And the thought arises that history accomplished, like the prophets of the future, is better respected by others than its own people. The ordinary Englishman has paid too little attention to the historical shrines of his country. He knows little of their whereabouts or their significance. There may be some excuse. Most of our modern battlefields stand for internecine turmoils that perhaps were better forgotten. Where, then, is to be found the heart of English history? Upon one view of such a question the only conceivable answer, indeed, is that it is here in this great London, with the grim Tower in the east, and our mother church, the Abbey, in the west, each lapped by the ancient Thames. But leave the capital as a thing apart, and look upon the country.

* * *

An Englishman who had been far away came home again. He felt he would like to look again upon some fair spaces of his own dear homeland; it should be the simple pastoral, with innumerable lanes interlaced, and frequent villages, small and compact, with a church spire mounting upon each of them—little communities of peaceful folk, happy in their completeness and content, something left in them still of the feeling and clannishness of the early families that assembled underneath their village trees. He felt he would like to look upon England the fruitful, with gardens and orchards. Autumn days had come. A soothing stillness was in the air, a smell of the season abounded, little boughs that had been bent with fruit were straightening themselves out again, and the bigger boughs were loosing bronze

and golden leaves that fluttered with some melancholy to the moistened earth. Here and there, amid bushes or by a wall, there were leaves that burnt and glowed in a full scarlet like maple-leaves he had seen in days gone by on forest-sides in Ontario. One county of England answered fully to the need, and that was Kent. There was another reason, seeming to spring from an elementary curiosity, why he should ride through Kent, and that was a wish to see what kind of country had been chosen by the War Lord of England for his home. To the people, Kitchener is of Egypt and of Whitehall. And some remember that he was born an Irishman. Yet there is not one man in a regiment or even a woman in a hospital who has thought of this celibate man, of the cold demeanour, of the square forehead, of the steely eyes, as a man with a home. If they thought, they do not know. Yet when he had done some of his hardest work he chose to make a home, a seat for his earldom, somewhere in England, and there he will go for a day or two now and then when there is a chance for a snatch of rest. You might not fancy Lord Kitchener as a man of any sentiment, or given to a fine imagination or keen perception in any matters other than those which relate to armies and their management. But, if the signs are not entirely wrong, there is something most wonderful in his choice of a place for home. He chose to go where England first began, and where her best armies first assembled. He chose the country that often meant more to England than any other. He chose what more than any other is the soldier's country, and at Broome Park therein he made his home. It was a wonderful selection. So the man who had wandered got up and rode from the southern part of Kent into Kitchener's country. He began by Sandwich and Ebbsfleet, where Hengist first came forcing his anxious road up toward the Medway. No place on the coast of Britain has a history more redolent of the stirring past than this quaint Sandwich that is sleeping its old age away, the Sandwich that was once a most prosperous port, the spot from which the English expeditions were continually directed against the old-time France that, strangely enough as it seems now, was indeed our stern enemy. The ships of Sandwich sailed forth and made war against the ships of France, and won. When Henry the Sixth was king they fetched Queen Margaret from France; when Henry the Seventh was on the throne they took an English army to France, and brought it back again. The third Edward sailed from the Isle of Wight with an army for France, and, making Calais surrender, came again with his queen and the Prince of Wales to Sandwich port. Another time he went out from the harbour, captured forty Spanish pirates, and brought them back with him. Here the Black Prince brought King John of France a prisoner. How it did seem that Sandwich, chief naval and military port of the nation,

with its freemen uncommonly prosperous, was something like a hub of the world itself; and finely proud were the excellent French when once they came along and did some damage to it! Well might Queen Bess pay her queenly respects to this historic spot, and sleep for a night at Sandwich. All the coast along from here to Dover, a few miles away, is the patch of shore that mattered more than anything in the world where waves touch land to the making of England. Here the Romans came and made their grand fortress at Richborough near by; Roman engineers started that wonderful road that leads from south to north-west of England, and has the name of Watling Street. Cæsar's soldiers were the first to march along it; the men of Kitchener's New Army are tramping on it now. And, reflecting upon a gentler case, St Augustine came to this same shore, and he tramped his way through Kent until he came to the end of some rising ground, and then looked down upon the spot that he consecrated, where Christianity had its first establishment in England. It is not without emotion that any wanderer can stand now upon this brow and look down upon those spires of Canterbury. And here, in the cathedral, near to the place where England's armies first assembled, is the tomb of the Black Prince, with his helmet and gauntlets, and his sword, scabbard, and surcoats, with the royal leopards and *fleur-de-lis* still showing plainly, though they have hung there for more than five centuries. There is the Pilgrims' Way from the south to Canterbury. It is a devious path, charming but sometimes difficult. You may travel by it if you please, and can enjoy Kent in no better way. But the wanderer seeing Kitchener's country chooses the Watling Street, the road of the Roman soldiers and the road of the khaki army. Perhaps it is a score of miles from Dover to Canterbury along this road. A little past the middle of this Kentish stretch there is a rolling plain on the right. Leftward a valley embosoms some quaint little villages. There is Denton, and Tappington, and the old manor of the Barhams, which was the scene of some of the *Ingoldsby Legends*; and there is Barham itself, and Kingston, with an old inn to which the wanderer rode, the old 'Black Robin,' once the home of a fine highwayman who stopped the coaches on the turnpike up above. Riding northward along this way we pass a big lodge gateway on the left. It is the entrance to Kitchener's own country, right on the Roman road. You must travel along Watling Street to arrive at Broome Park. Across a field on the other side of the road, nearly within sight, there is a tomb of a past hero let into the side of a little hill. Big trees bend upon this lonely mausoleum. Above its doors a long gun leans out, some cannon-balls beside it. Here a soldier who fought for Britain sleeps. Kitchener's country is on the edge of Barham Downs, and this is the place of the armies. When Cæsar

came up from Deal he fought and had the better of the islanders, and made his first great camps at this place. Some of his earthworks are still here. Traces of these Romans are nearly everywhere. In 1213, long after Cæsar's days, King John collected an army here when the Pope had excommunicated him, and France threatened invasion. That was a great army too; it counted sixty thousand men. The French continued worrying, and half a century later Simon de Montfort made a general assembly of the English forces at this place. In 1642 the Cavaliers mustered on the Downs; and when, a hundred years ago, Napoleon brought his Grand Army to Boulogne, and prepared for that invasion that never did take place, a great camp of British soldiers was formed on this historic plain, these Barham Downs. This is Kitchener's country; the restful moments of the War Lord are spent near by. When peace comes again, he may spend complacent days at this place where great English armies have gathered almost ever since England began. But now, even here, on days when the air is still or a gentle breeze is puffing from the coast, a distant murmur may sometimes be faintly heard. Big guns in France!

* * *

This is stern country; it whispers from the past of tremendous things. But it is beautiful, and it abounds in Nature's chastest, sweetest work; and to a tale of armies and of war, with only one soft touch of a pilgrim's journey, a little childish fantasy may be added for a close. On the stone columns of the lodge gateway of Broome Park there are eagles with their wings outstretched. The eagles look toward each other. These eagles were there before Lord

Kitchener came; but as marking the home of a great warrior, fighting for the greatest cause, they may gather fame. Wanderers like him who rode this way look for them. France and America have eagles of freedom for their emblems; unhappy Germany has eagles with savage claws and vulturous beaks. These eagles in Kitchener's country have no significance. But if they are anybody's eagles they are the children's, for the little people of the villages about have an interest in them. They look at them, and make pretty stories about them. And in particular there is a children's tradition belonging to them, and it is believed by the little boys and girls. It matters not that the eagles fixed on these columns are made of lead and painted white. It is firmly an article of faith among the little innocents of these parts that every night, when the bell in the parish church in the low land at the back strikes the midnight hour, the eagles change their columns; the right eagle flutters to the left and the left eagle to the right. Why not? Even eagles may need change. And no child of Kitchener's country has been in Watling Street at the most lonesome hour to prove or disprove the belief. It will endure long beyond the extinction of the black eagles of the Hohenzollerns. In all great men there is a touch of simplicity and gentleness that is the mark of the divine in human nature. If it is not on the surface, it is still there. Great generals love little children, and when all are happy again, and soldiers no longer dash their way down Watling Street, no soldier of Kitchener's country will tell the babes that the eagles do not change places when the ghosts are restless in the churchyards.

THE DAY OF WRATH.

CHAPTER III.—continued.

DALROY was only vaguely conscious of the scope and magnitude of events in which he was bearing so small a part. He knew enough of German methods in his immediate surroundings, however, to reckon as little of having killed two men as though they were rats. His sole and very real concern was for the girl who answered not. Before going in search of her he was tempted to don a *Pickel-haube*, which, with the rifle and bayonet, would, in the misty light, deceive any new-comers. But the field appeared to be untenanted, and it occurred to him that his companion might actually endeavour to hide if she took him for a German soldier. So he did not even carry the weapon.

He found Irene at once. She had simply fainted, and the man who now lifted her limp form tenderly in his arms was vexed at his own forgetfulness. The girl had slept but little during two nights. Meals were irregular and

scanty. She had lived in a constant and increasing strain, while the real danger and great physical exertion of the past few minutes had provided a climax beyond her powers.

Like the mass of young officers in the British army, Dalroy kept himself fit, even during furlough, by long walks, daily exercises, and systematic abstention from sleep, food, and drink. If a bed was too comfortable, he changed it. If an undertaking could be accomplished equally well in conditions of hardship or luxury, he chose hardship. Soldiering was his profession, and he held the theory that a soldier must always be ready to withstand the severest tax on brain and physique. Therefore the minor privations of the journey from Berlin, with its decidedly strenuous sequel at Aix-la-Chapelle, and this D'Artagnan episode in the neighbourhood of Visé, had made no material drain on his resources.

A girl like Irene Beresford, swept into the sirocco of war from the ordered and sheltered life of a young Englishwoman of the middle-classes, was in altogether different case. He believed her one of the small army of British-born women who find independence and fair remuneration for their services by acting as governesses and ladies' companions on the Continent. Nearly every German family of wealth and social pretensions counted the *Englische Fräulein* as a member of the household; even in autocratic Prussia *Kultur* is not always spelt with a 'K'. She was well dressed, and supplied with ample means for travelling; but plenty of such girls owned secured incomes, treating a salary as an 'extra.' Moreover, she spoke German like a native, had a small sister in Brussels, and had evidently been accustomed to good society. Undoubtedly she was a superior type of governess, or, it might be, English mistress in a girls' high school.

These considerations did not crowd in on Dalroy while he was holding her in close embrace in a field near Visé at dawn on the morning of Wednesday, 5th August. They were the outcome of nebulous ideas formed in the train. At present his one thought was the welfare of a hapless woman of his own race, be she a peer's daughter or a postman's.

Now, skilled leader of men though he was, he had little knowledge of the orthodox remedies for a fainting woman. Like most people, he was aware that a loosening of bodices and corsets, a chafing of hands, a vigorous massage of the feet and ankles, tended to restore circulation, and therefore consciousness. But none of these simple methods was practicable when a party of German soldiers might be hunting for both of them, while another batch might be minded to follow 'Heinrich' and his fellow-butcher. So he carried her to the stable and laid her on a truss of straw noted during that first vivid glimpse of the interior.

Then, greatly daring, he milked the cow.

Not only did the poor creature's suffering make an irresistible appeal, but in relieving her distress he was providing the best of nourishment for Irene and himself. The cow gave no trouble. Soon the milk was flowing steadily into the pail. The darkness was abysmal. On one hand lay a dead woman, on the other an unconscious one, and two dead men guarded the doorway. Once, in Paris, Dalroy had seen one of the lurid playlets staged at the Grand Guignol, wherein a woman served a meal for a friend and chatted cheerfully during its progress, though the body of her murdered husband was stowed behind a couch and a window-curtain. He recalled the horrid little tragedy now; but that was make-believe, this was grim reality.

Yet he had ever an eye for the rectangle of the doorway. When a quality of grayness sharpened its outlines he knew it was high time

to be on the move. Happily, at that instant Irene sighed deeply and stirred. Ere she had any definite sense of her surroundings she was yielding to Dalroy's earnest appeal, and allowing him to guide her faltering steps. He carried the pail and the rifle in his left hand. With the right he gripped the girl's arm, and literally forced her into a walk.

The wood indicated by Maertz was plainly visible now, and close at hand, and the first rays of daylight gave colour to the landscape. The hour, as Dalroy ascertained later, was about a quarter to four.

It was vitally essential that they should reach cover within the next five minutes; but his companion was so manifestly unequal to sustained effort that he was on the point of carrying her, in order to gain the protection of the first hedgerow, when he noticed that a slight depression in the hillside curved in the direction of the wood. Here, too, were shrubs and tufts of long grass. Indeed, the shallow trough proved to be one of the many heads of a ravine. The discovery of a hidden way at that moment contributed as greatly as any other circumstance to their escape. They soon learnt that the German hell-hounds were in full cry on their track.

At the first bend Dalroy called a halt. He told Irene to sit down, and she obeyed so willingly that, rendered wiser by events, he feared lest she should faint again.

When travelling he made it a habit to carry two handkerchiefs, one for use and one in case of emergency, such as a bandage being in sudden demand; so he was able to produce a square of clean cambric, which he folded cup-shape and partly filled with milk. It was the best substitute he could devise for a strainer, and it served admirably. By this means they drank nearly all the milk he had secured, and with each mouthful Irene felt a new ichor in her veins. For the first time she gave heed to the rifle.

'How did you get that?' she asked, wide-eyed with wonder.

'I picked it up at the door of the shed,' he answered.

'I remember now,' she murmured. 'You left me under a hedge while you crept forward to investigate, and I was silly enough to go off in a dead faint. Did you carry me to the shed?'

'Yes.'

'What a bother I must have been! But the finding of a rifle doesn't explain a can of milk.'

'The really important factor was the cow,' he said lightly. 'Now, young lady, if you can talk you can walk. We have a little farther to go.'

'Have we?' she retorted, bravely emulating his self-control. 'I am glad you have fixed on our destination. It's quite a relief to be in the charge of a man who really knows what he wants, and sees that he gets it.'

He led the way; she followed. He had an eye for all quarters, because daylight was coming now with the flying feet of Aurora. But this tiny section of Belgium was free from Germans, for the very good reason that their cohorts already held the right bank of the Meuse at many points, and their Engineers were throwing pontoon bridges across the river at Visé and Argenteau.

From the edge of the wood Dalroy looked down on the river, the railway, and the little town itself. He saw instantly that the whole district south of the Meuse was strongly held by the invaders. Three arches of a fine stone bridge had been destroyed, evidently by the retreating Belgians; but pontoons were in position to take its place. Twice already had Belgian artillery destroyed the enemy's work, and not even a professional soldier could guess that the guns of the defence were only awaiting a better light to smash the pontoons a third time. In fact, barely half a mile to the right of the wood, a battery of four 5.9's was posted on high ground, in the hope that the Belgian guns of smaller calibre might be located and crushed at once. Even while the two stood looking down into the valley, a sputtering rifle-fire broke out across the river, three hundred yards wide at the bridge, and the volume of musketry steadily increased. Men, horses, wagons, and motors swarmed on the roadway or sheltered behind warehouses on the quays.

As a soldier, Dalroy was amazed at the speed and annihilating completeness of the German mobilisation. Indeed, he was chagrined by it, it seemed so admirable, so thoroughly thought-out in each detail, so unapproachable by any other nation in its pitiless efficiency. He did not know then that the vaunted Prussian-made military machine depended for its motive-power largely on treachery and espionage. Toward the close of July, many days before war was declared, Germany had secretly massed nine hundred thousand men on the frontiers of

Belgium and the Duchy of Luxembourg. Her armies, therefore, had gathered like felons, and were led by master-thieves in the persons of thousands of German officers domiciled in both countries in the guise of peaceful traders.

Single-minded person that he was, Dalroy at once focussed his thoughts on the immediate problem. A small stream leaped down from the wood to the Meuse. Short of a main road bridge its turbulent course was checked by a mill-dam, and there was some reason to believe that the mill might be Joos's. The building seemed a prosperous place, with its two giant wheels on different levels, its ample granaries, and a substantial house. It was intact, too, and somewhat apart from the actual line of battle. At any rate, though the transition was the time-honoured one from the frying-pan to the fire, in that direction lay food, shelter, and human beings other than Germans; so he determined to go there without further delay. His main purpose now was to lodge his companion with some Belgian family until the tide of war had swept far to the west. For himself, he meant to cross the enemy's lines by hook or by crook, or lose his life in the attempt.

'One more effort,' he said, smiling confidently into Irene's somewhat pallid face. 'Your uncle lives below there, I fancy. We're about to claim his hospitality.'

He hid the rifle, bayonet, and cartridges in a thicket. The milk-pail he took with him. If they met a German patrol the pail might serve as an excuse for being out and about, whereas the weapons would have been a sure passport to the next world.

It was broad daylight when they entered the miller's yard. They saw the name Henri Joos on a cart.

'Good egg!' cried Dalroy confidently. 'I'm glad Joos spells his Christian name in the French way. It shows that he means well, anyhow!'

(Continued on page 71.)

THE PASSING OF THE BOOKSHOP.

By CLIVE HOLLAND.

THERE is perhaps no feature of modern life in relation to books which gives the real bookman and the lover of books more cause for heartache than the passing of the bookshop. By that phrase we do not mean to infer that there are no longer shops where one can purchase books, for there are many whose windows are garishly dressed with 'displays' of novels bedecked in wrappers with enticing coloured pictures upon them, and whose entrances are blocked by stacks of 'sixpennies,' on the covers of which are pictures usually superior in interest to the contents of the volumes themselves.

In these places there is an odour of cheap printing-ink and an atmosphere of hustle which is quite different from the atmosphere of the real bookshop of past times. If one takes down a volume to sample it, one is conscious of being furtively but carefully watched by some lynx-eyed assistant, lest, forsooth! the volume should leave the shop without an adequate exchange of coin of the realm. And if one is a little too long in the process of 'tasting,' one is plagued by the inquiry, 'Can I get you anything?' or by such a phrase as, 'A capital story that, sir; quite the best the author has ever written.'

Everybody's reading it.' That, for the real bookman, ought to be a sufficient incentive to cause him to replace the volume forthwith upon its shelf, even though he knows full well that the shopman's opinion of the merits of the book has been gathered either from the obliging but naturally biased information given on the wrapper by the publisher, or by a mere 'dipping' at odd moments into the story itself.

But these are not bookshops as the book-lover knows the term. They are just depots where the insatiable maw of what is known as the reading public is satisfied, chiefly by productions which have nothing to recommend them either upon the score of beauty, literary charm, or truth to life; and, alas! if one may accept as truth reports concerning the best sellers, it is poor stuff that they dispense in such colossal quantities. Harmless enough it may be, but the merchandising of it and the methods by which it is brought about give the true bookman ample cause for disquietude.

There is something, indeed, positively indecent to the book-lover's soul in the way in which the modern book is marketed. After an experience at one of the depots we have in mind, on reaching home and entering one's library one looks almost shamefacedly at the treasured volumes which stand upon its shelves. What, indeed, has a first edition of Fielding, Thackeray, Scott, Dickens, Hardy, Meredith, or Byron and Wordsworth, or even Stevenson, Browning, Tennyson, and Stephen Phillips, to do with Hall Caine, Marie Corelli, Ethel M. Dell, Charles Garvice, William le Queux, and the crowd of versifiers of to-day?

The longer one stays in the library and conjures up the visions brought to life by great writers, and communes with the characters in poetry and prose that will live for all time, the poorer in quality seems the literary output of to-day. But we are not altogether inclined entirely to blame the authors. The passing of the true bookshop, with its atmosphere of peace and literary ease—with its well-read owner who knew the books, and was never tired of discussing them; who could recognise and light upon exactly the book one wanted without a hurried turning over of the pages of the *English Catalogue* or Mudie's latest list, making not only for dignity in the selling but dignity in the production—perhaps, in a sense, excuses the writers who, either for love of gold or fame, pander to the lower instincts of the masses, and produce book after book when they have nothing particularly fresh to say. The passing of the bookshop has had at least some reflex action upon their own lives.

Here and there in very remote districts bookshops of the older type linger. The owners have generally lost, we have noticed, some of the peaceful contentment which aforetime distin-

guished their faces, and have gained somewhat in sadness of expression. Most of them, we fancy, know that they are probably the last of their line; that if they hold on against cruel modern competition they will be the last; and when the time comes for the shutters to be put up, if they are taken down again it will be under new conditions.

In these shops we have in mind there still lingers the bookish atmosphere which is so grateful to the book-lover. In the dim light, with the tiers of often, let it be admitted, dusty shelves, one experiences the friendly feeling which has, since Johnson's age, given to the true bookshop its chief charm. Then there is the quietude; the outside noises of the street appear to be stopped at the very door, and only come to one softened, like the music of a viola played on the mute.

There is, however, just that element of adventure in these survivals of the real bookshop which gives an interest to the possible customer. Perhaps one may discover, after an engaging search which will not be interrupted by inanities bred of ignorance and pushfulness, some volume one has long wished to meet with and acquire. Not a pearl of great price for nothing, or the old bookman whose treasures one is inspecting will not have learnt his business, but some book which, of little intrinsic value, may yet be of great sentimental or personal value to one's self. One may take it down from its dusty shelf out of merest curiosity, scarcely noticing the faded title upon the back, and then there comes the glow of a surprise. At last the book one has searched for, perhaps along almost miles of shelves, during years, and in many bookshops, lies in one's hand! Rapidly one turns to the inside cover or flyleaf to find what value the owner sets upon it. It may be pounds, shillings, or merely pence; but, whatever the sum is, the discovery of the book brings the same thrill of excitement to the discoverer.

Then, perhaps, when the bargain has been struck, and one has listened to the old bookman's tale—which, by the way, is not seldom a sad one of fading local interest in his wares, and a heavy falling off in sales by means of postal catalogues—one may hear the story of how the longed-for volume one has just discovered came into his possession. For the old bookman, unless his memory has begun sadly to fail and play him tricks, will tell you where he purchased and how he acquired nearly every one of the thousands of volumes which stand upon the shelves.

That little edition in gray-green cloth of Thomson's *Seasons* was bought, for instance, when an old lady—the last sister of three, who kept a select boarding-school of the old type for 'the daughters of gentlemen'—died some years ago. It was probably one of her treasures, for, though it had been carefully kept, it had in-

scribed in it: 'To Miss Louisa Wing, with the affectionate regard and compliments of John.' Who the 'John' was, and whether, but for fate, Miss Louisa might have become Mrs John, no one could tell; but the simple inscription in brown and faded ink was quite enough, surely, to give to the book a flavour of romance. And that early edition—'title-page slightly damaged,' as the catalogue description had it—of Defoe's immortal work, bound in brown calf, brought to mind the prize-day in a boys' school of long ago, for on the cover, in pedagogic handwriting, we found inscribed: 'To Master John Walter Mickleham. A prize for good conduct and proficiency;' and then followed the signature: 'Josiah Williams, Master of Arts.' Proficiency in what? one was tempted to inquire. But the question could never be answered, for both Josiah Williams, who wrote his signature with so elaborate a flourish beneath it, and the school-boy recipient had long ago passed to the other side. But we can imagine, at least, the joy of the schoolboy who had *Robinson Crusoe* as a prize rather than some dry-as-dust manual upon *Correct Conduct for Young Gentlemen*, or *Elevated Thoughts for the Improvement of Youthful Minds*. How the boy must have revelled in the pages of Defoe! And perhaps he was one who, inspired by that immortal book of adventure, ultimately set forth on some adventuring of his own. That book was purchased, we ascertained, in a job lot, tied together with tape, and thrown years before into the corner of an attic used as a lumber-room in a neighbouring manor house of Jacobean date. On a shelf near the door was another volume with a history. It was a copy of *The Whole Duty of Man* which had belonged to no less a person than General Wolfe. It may have voyaged with him to Canada, for its pages in places were stained as though with salt water, and there seemed to hang about the calf in which it was bound an odour with the tang of the salt sea in it; but whether the thumb-marks in the volume were those of the famous general who died in the hour of victory, and whether it was his fingers that had turned down pages eighty-seven and one hundred and three, no one could tell. But for the old gentleman, who wore a gray beard, whose eyes were somewhat weak but very friendly, and whose shoulders had the

true stoop of the student and the bibliophile, there was a history to each book.

Another true bookman, the author of one or two valuable pamphlets upon the archæology and history of the neighbourhood in which he lived, we found in a western county.

'Ah!' he said, 'the days of this kind of business are almost done. You are the first gentleman, sir, who has entered my shop—save to ask me for "sevenpennies" or "sixpennies," or the way to St Mary's Church—for the last two days. Folks don't read books nowadays; they swallow them, and so it doesn't matter much how they are bound, produced, or written, and that accounts for the big sales of such trash as — and — [we spare the authors' feelings] are constantly turning out. Twenty years ago we sold books—I mean *real* books,' and he threw a glance of affection along his crowded shelves; 'but now, if it weren't for a little business by post, and the fact that the shop's my own, and that I have been a careful liver, I should have to put up my shutters, for the trade I do would scarcely keep body and soul together if I had to pay rent.'

Yet to the bookman this shop, with its shabby front, its faded sun-blinds—a survival of the time when, doubtless, handsomely bound first editions played a considerable part in the window display—how infinitely preferable was it to the modern bookseller's garish riot of 'sixpennies' and 'sevenpennies,' well mixed up with Goss's armorial china, buckets and spades, tennis-balls, and unwholesomely brilliant coloured 'rock,' a few doors farther down!

But be this as it may, the old bookshop, which twenty years ago or so became, as it were, a backwater of literary life, is gradually passing away altogether. The desire for cheapness, competition, and modern hustling methods have rung the knell of the bookshop, and those who care for books—happily there are a few still surviving!—will more and more be driven to their own shelves for solace, and for the pleasure that once came through the medium of the bookshop of the country town. Perhaps it may bring the book-lover back to the study of the volumes he has and loves, even if with a saddened heart he realises that with the passing of the bookshop the happy hunting-ground of the book-lover will become more and more restricted in area.

THE STEAM PIRATE.

By W. F. BATTEN.

CHINA is the home of piracy. But though there have been, and still are, many junks and snake-boats, some lorchas, and even a schooner or two engaged in that lucrative 'profession,' yet I believe there has been only one instance known of a steam pirate vessel in Chinese waters.

The craft with which this story deals was

originally built for a gunboat, but, becoming obsolete, had been sold out of the service, and the mercantile firm that bought her had sent her out to China for resale there. It happened that at this particular time the pirates of the West River, with their confederates on shore, had taken a hand in one of the periodical

insurrections in 'the rebel *kwang*' (provinces). Hence one of the Viceroy's small river-gunboats, commanded by a European, was told off to capture or destroy such a dangerous innovation on piratical customs of over two centuries as a steam pirate constituted to shocked officialdom. Now, as this craft was three or four times the size of his Excellency's little river-gunboats, I thought it quite possible that the sinking might be the other way about! For in those days the broadside guns of war-vessels were smooth-bores, a single muzzle-loading rifled gun only being carried in the smaller boats, generally in the bows, and this of course spelt fighting at short ranges. Consequently these piratical gentry—who, like most Chinese of fighting race, quickly learn to handle ships' guns—were pretty well as good at the game as the better-disciplined crews of the river-gunboats.

I recollect that it was on a very sultry evening, and during the typhoon season, that I received written orders to get up steam in my little toy gunboat, and endeavour to intercept this piratical steamer, which was then reported to have gone to 'the Delta' to bring down a supply of 'Tower' muskets, lead, and kegs of powder for the rebels up the Si-Kiang. That official document, however, entirely omitted to state where this new departure in the piratical line was then supposed to be, to look for her in 'the Delta' being much like looking for the needle in the proverbial bundle of hay. It was, too, just at the time when the barometer was falling in a way I did not at all like. In this dilemma I could think of but one thing to do—to consult the *tankars* (fisher and sailor folk), who saw or heard of almost all that occurred on these inland waters for a thousand miles or more. But to demand information from these people was one thing, to get it quite another—probably an impossibility to the ordinary gunboat commander. But I was not quite that to them, for I had always been interested in, and frequently had befriended, these quaint 'people of the water,' of whom there are a million or so living on the Canton River alone. They were, however, like all oppressed and despised races, cunning, secretive, and obstinate to an almost incredible degree. My best friends amongst them were 'the wives of the husbands,' who ruled their lords with a rod of bamboo. 'The husbands of the wives,' too, always grinned a welcome, for I often chartered their craft, when clean and in good order, for shooting or fishing trips. Hence I had a card up my sleeve in this search for the steam pirate that any other commander, European or native, would have lacked. So it was to a house-boat at 'a buying-fish station' that I first turned my attention. But I left my little armed steamer, and paid my visit in a sampan, a sort of shoe-shaped native boat that I carried on board.

When I reached the house-boat I found that her owners had just disposed of a large cargo of salt fish. This was fortunate, as the attraction that a pan of cream presents to stray cats is not in it with that of a store of silver to Chinese fishermen. Besides, Sam-chi (Little Ah Sam, so nicknamed because he was over six feet in height) and his better half, Ah Muey, were considered to be a wealthy couple; and, though pirates as a rule do not meddle with fisherfolk, this might be the proverbial exception. So, knowing my *tankars*, I politely remarked, 'Well, Ah Muey, you belong number one just now?' 'Hi [yes], capitan,' replied that lady; adding coquettishly, 'What for you no come see me so long time?'

Now, lest it should be supposed that I was engaging in a reprehensible flirtation with a young and attractive married native lady, I had better describe Madame Ah Muey's personal appearance before going any farther. She was about fifty years of age, and, being rather bald, had, when she caught sight of me, hastily clapped an old 'cheese-cutter' (navy cloth cap) on the back of her head in quite a rakish fashion. Her little, black, beady eyes were mere slits over her high cheekbones and flat nose, whilst her mouth had taken a 'list to starboard' by reason of the thickness of the stem of her brass-bowled tobacco-pipe, which she also used for rapping her worsen half's shaven pate when he displeased her. She wore an old navy pea-jacket over her native costume, whilst a pair of soldier's ammunition boots adorned her feet, an expanse of stout yellow ankle filling the gaps between their tops and the hem of her short wide trousers. Such was the sibyl who, I little doubted, 'could an she would' help me out of my dilemma.

For, though the orders I had received were ridiculously vague, still a failure to carry them out would, I knew, seriously injure my reputation at Canton. Therefore, before proceeding to business, I complimented Ah Muey on her looking 'all same one pieceny English missee.' 'Choi' ('Get along'), replied the lady, hugely delighted. 'More better you tell me what for you come see my?' 'Why, Ah Muey, you savey [know] one *lallelong fo shun* [piratical steamboat] has come this side, so I go catch he.' Then, however, I changed my tone, and said very seriously, 'You must find out for me where she is now, for if you don't you may get a visit from the pirates as they pass. You no savey they have catch [taken] all that silver at that Hong-kong side buying-fish station, and have chopped [slashed with swords] the *citow* [owner] and his sons too?' At this Ah Muey's face went a sort of greenish gray, and she hastily summoned her spouse from below to hear the news and see what could be done. After much discussion, on my promising a *cumshaw* [reward], and to maintain secrecy as to their share in the matter, word was passed to all the members of

the *tankar* fraternity, both up and down the river, to obtain the information I required.

Then, as I knew it would be quite impossible for the pirate to keep out of sight of these craft for long, I went back to my little river-gunboat with an easier mind. And, sure enough, just after sunset the next evening the news I expected reached me. It appeared that, for the convenience of certain *houngs* ('firms') in collusion with the rebels, she had gone down toward Macao, where the go-betweens who had bought this craft for the pirates would put the arms and ammunition the rebels expected on board.

As we passed the 'buying-fish junk' on our way out, the *tankars* lighted joss-candles, fired crackers, and began to beat gongs in order that the evil demons befriending the pirates should be frightened from our course, and the good spirits induced to help us. Nor did I laugh at all this; for I knew it was kindly meant. My little vessel, with every light carefully screened from view, was then gliding swiftly and silently down the broad river toward the Delta. But, though pleased at the success of my mission, I became anxious again when the glass (which had risen during the past twenty-four hours) began once more to fall rapidly. The outlook from the bridge, too, showed ominous signs of the approach of a typhoon. Soon, also, wild squalls began to alternate with splashes of warm rain or misty drizzle, whilst native craft in scores, with several European vessels, were driven past us on the rising gale. The oppressive and close atmosphere, the dismal moaning of the wind, the darkened sky, and the heavy sea combined to make a prospect ugly enough, in all conscience.

The pirate, however, being over four hundred tons, had a better chance in such weather than my little craft of but a quarter of that measurement. Her guns, too, threw three times our weight of metal; whilst her crew was twice as numerous as mine, according to the fisherman who had seen her and described her to Ah Muey. Unfortunately it was not only against human adversaries that we had to contend, but with the forces of nature also, and these were much more to be dreaded. My little steamer had by this time been stripped of all superfluous fittings, whether of wood or metal, that were of the nature of splinter-making material, and everything was rendered as snug and secure on deck as the nearness of an enemy would permit. Our topmasts had then been struck and our lower masts were as naked as poles, while plugs and mats for shot and shell holes were all ready at hand. We were already shipping enough of the heavy seas to keep our teakwood decks and boats flooded.

By eight bells we had nearly reached the last of the inlets that would afford secure shelter from the full force of the typhoon. The engines, meantime, were working smoothly and well at a

steady ten knots. Our little craft, fortunately, was a fine sea-boat, leaping lightly up the huge seas and sliding down their depths without effort or strain.

Then, as we drew near our destination, I jammed myself in one corner of the bridge and made persistent efforts to focus the land with my night glass. But after painfully clearing my eyes of the salt spray and driving rain, I made sure that the waste of waters was utterly void, never a craft of any sort in sight. An even heavier sea than its forerunners then expended its fury in a smash that tossed our little vessel's forefoot aside just as one might brush off a settling fly. 'What thing, quartermaster; how can I do?' I growled; whilst, as I shook myself after getting drenched to the skin, the old pilot at my elbow remarked, 'More better you go a littee more slow, sir.' 'I can't yet,' I snapped. 'Look out now, quartermaster!' as the little vessel, in fighting through a heavy sea, fell with a crash into the trough beyond. Then all four of us—commander, pilot, quartermaster, and lookout—clung to the iron rails like grim death as the next great wave broke in a solid mass against the forecastle-head, smothering deck and bridge right up to the funnel. I sprang to the engine-room, whilst the other three were shaking themselves like water spaniels; and as the hissing flood found its way over her lee side I shouted to the chief, 'Slow her down to eight knots, Mr Scot!' But still to leeward, where I suspected the pirate to be, there was no sign of our quarry. 'Keep her stem straight at 'em, quartermaster!' I had to shout again, blinking and peering alternately through my night glass. The little vessel was then quivering from stem to stern under her punishment. Fortunately the stout teak planking of her composite hull was bolted on to three-inch steel frames, whilst her powerful little engines, like her chief, had come out from the Clyde, and both were of the best. But presently a tremendous beam sea hit her squarely in the ribs, and, falling in masses of water on her deck, raced from broadside ports to lee scuppers. 'She's getting it too hot and heavy, Mr Scot; slow to six,' I shouted down the tube, getting a dry, 'I maun think so, sir,' in response. Another bell struck.

The watch on deck meanwhile, little heeding the hurly-burly, had, like so many water-rats, sheltered themselves from the raging seas in handy nooks and corners. I was then bruised and stiff, besides being drenched to the skin, and growing savagely indifferent to further elemental kicks, which seemed to be all I was to get for endangering my little craft amidst the angry waters, that now showed more and more signs of the approach of the threatened typhoon. The sky blackened, spiteful squalls in yet more furious sequence shrieked wildly from windward, whilst the salt spray was blown in blinding showers from the crests of the high, confused

seas. But in the rain and darkness the low, gray hull of my little vessel, I knew, even at close quarters, was almost invisible. Then suddenly a leaden-hued water mountain loomed up right ahead; and as, in quick response to the lessened strain on her throbbing engines, she rose over it, and with birdlike lightness perched momentarily on its summit, a dark mass of black hull was suddenly revealed, staggering and wallowing on a parallel course to our own, and scarce a couple of cables' length to leeward.

The lookout's shouted warning flung down the wind sounded but a whisper; the orders bellowed from the bell-mouthed trumpet, even the lengthened roll of the drum beating to quarters in response, were lost in the roar of the furious elements that seemed to clutch the little gunboat in an ever-tightening grip. Summoned by sight rather than hearing, two-score shadows glided from out the surrounding blackness to answer the sudden call, and eager barefooted gun-crews, stripped to the waist, were soon clinging leech-like to sloping side and canted deck as they hauled, thrust, or swayed the long nines forward till their gaping muzzles peered menacingly out at the stranger. A second order, perforce bellowed through the brazen trumpet to men scarce a score of feet from me, was but faintly caught as it sped away on the roaring gale; though, in quick response, the sultry blackness and flying rain-mists around were momentarily pierced by a quivering sheet of ruddy flame. Yet our warning gun and flashing signal-lamps brought never a sign from the high black hull of the stranger as she forged ahead in the darkness beyond.

Then, as we drew more under shelter of the high land, I shouted down the engine-room tube for a steady ten knots again. Still we had lessened but little the gap between the two vessels, when out of the startled pall-like sky, through mist-wreaths and storm-wrack, there showed horizonward a thin line of clear, white light, which disappeared into the distant darkness with a burst of fire. 'There goes her flag and her answer together—a shell from a heavier rifle than ours,' I said, and then shouted to the boatswain to get in the signal-lamps and see all lights screened again. None too soon either, for dense volumes of fire-flecked smoke began to bank up to leeward as she increased her speed, whilst two flashes from her stern ports lit up her after-end, revealing for a moment an ugly steam-collier-like craft of composite build, and calculated to stand a lot more knocking about than my own little vessel, I thought. But my speculations were abruptly cut short by the scream of a second shell that careered over our heads and burst far away in the blackness astern. I, however, allowed no reply to either stern guns or midship rifle, as, with lights all 'doused,' we continued to creep up to our big enemy.

Meanwhile I left the bridge for a minute or two and went amongst my gun-crews. 'I cannot ensure that all your shells will prove live ones, gunner; but I'll run her close up to give your pop-gun a better chance. So, mind you keep it laid on her stern and right on the water-line.' Then I ordered the crews of the broadside smooth-bores to double-shot them, and at close quarters to use bar-shot on her side as she rolled. After shouting this into the gun-captain's ears at the utmost pitch of my voice amidst the elemental hurly-burly, I climbed wearily up to the canted bridge again. The pirate had now slowed down till she seemed a mere unwieldy mass rolling heavily amidst the whitened surges, so that I hoped to run right under her stern; but in a momentary lull in the fierce gusts of wind, the throbbing of the engines gave us away, and proved instant signal for the black hull towering above us to be lit up with vivid flame-flashes, the round-shot from her smooth-bores holing our funnel and converting our trim lower masts into ragged stumps, whilst a gaping rent in the bridge canvas testified to the narrowness of the quartermaster's escape. Fortunately the heavy rolling of their platform had spoilt the gunners' aim, and their shot flew high, or we should have been badly mauled indeed at such close range. The quartermaster, too, with a grin, called my attention to the bright teak and brass wheel badly chipped by a flying fragment of metal; and though no one on the bridge was hit, there was a gap in the gun-crew beneath it—quickly filled, though; and then at point-blank range the four smooth-bores on the lee side sent their reply to that message from the black mass inshore of us. But our rifle's shell was blind, and no burst followed a palpable hit—roguey or damp to blame, as might be. A second slowing down of our opponent's engines, however, induced me to try again to run in under her stern. Thereupon, with sudden change to full speed, she rushed down the heavy seas with evident intention to give us the stem, and so crush her puny antagonist beneath her heavy forefoot. But her lumbering onrush failed, for our smart little craft, that could turn in her own length, swiftly swerved, and, once clear, poured in round-shot and rifled shell from each gun that would bear. Then, finding that we had the heels of her, the pirate continued on her course to the nearest shelter, working her stern guns meanwhile. The rifled weapons of both craft seemed to suffer from the same defect, almost all the shells proving blind, whilst our six-pounder was rapidly becoming too hot to handle.

I was again congratulating myself on the almost invisible target that my little gray gunboat presented in the driving rain mists, and had ceased to fight her end-on in order to work our broadside guns in place of the almost red-hot rifle, when suddenly there was an appalling crash as of shock of sudden collision or sunken

rock ; the little gunboat reeled blindly forward, shivering from end to end amidst a rending and tearing of wood and metal-work, and the cries of grievously wounded men. We had caught the full weight of metal of the pirate's broadside !

That they had realised our plight the exultant yells borne down the blast quickly showed. Two of the five guns then being worked had been put out of action, whilst the crews either lay still beside their silent weapons or were rolling in agony in the lee scuppers. I had the wounded men quickly carried below, and the two remaining smooth-bores, with the partially cooled rifle, continued the fight. But very grievous was it to me to see these quiet forms lying on the torn and blood-stained deck—one of several ominous signs that the last hour of the little gunboat could not be far off. So, leaving the bridge, I again went down amongst the gun-crews, and by word and action quickly worked them into a state of reckless indifference to wounds and death that I felt must fully equal that then being shown by the pirates, who, however, fought with the shadow of the Canton executioner's sword over their heads. My thoughts were very bitter, too, as I realised that most of the highly priced projectiles of our rifled six-pounder were mere fraudulent dummies, else the fight had gone very differently ere now ; for the fine shooting of my master-gunner would have torn great gaps on the exposed water-line of the pirate as she rolled and wallowed along on the heavy seas, instead of merely making neat clean-cut apertures, easily plugged when she lifted herself well clear of the wave-summits. I saw, also, that a large rent gaped in the canvas round our bridge, and this, like the smashed iron rails, was dripping with blood ; so that, had I been upon the bridge instead of amongst my gunners, my body would have been lying behind it instead of that of the unfortunate lookout. By this time, too, not only were the deck structures wrecked and battered out of all shape, but escaping steam, smoke, and sparks were being driven across the deck in volumes.

The master-gunner, despite his hurts, stuck gamely to his rifle shell-gun, only grinning when I declared that 'a live shell must "pan out" before long,' for he knew as well as I that unless one did there would soon be never a one—blind or live—left. The men at the broadside smooth-bores were now excited almost to the pitch of frenzy by the loss of clansmen and comrades from the pirate's fire, and as they rapidly sponged, reloaded, and ran out their long nines, their bloodshot eyes and savage scowls showed a fierce determination to avenge the slaughter at all costs. Only a torn remnant of the Dragon flag still flew from the stern, for that from for'ard had disappeared with the mast from which it

flew. Constantly some grievously wounded man crawled sulkily below, compelled by my order to quit the gun to which his comrades stuck like leeches, and I believe would have gone down alongside had our boat sunk. For, though the pirate's shells, like our own, seemed to be blind, they got us time after time with their broadside smooth-bores.

My smart little vessel of that morning was by this time battered and distorted out of all recognition, so that I went back to the bridge with a heavy heart, and, standing by the quartermaster, twisted the spokes this way and that ; but though she darted hither and thither in quick response, she could never keep clear of the iron hail that persistently followed her from the pirate. The funnel was holed from uptake to cap, the escaping steam hissing in the slimy crimson pools on her scored and pitted deck, whilst the black smoke, now flame-flecked, that swept across it at times almost obscured the guns.

I had gripped the wheel-spokes with set teeth, and was despairingly meditating a desperate act, when frantic yells from our little shell-gun's crew reached my ears above the din around me. 'What is it, gunner?' I shouted, fully expecting some fresh disaster. But for answer, as the smoke blew clear, he pointed to a large ragged aperture in the pirate's stern, from which a volume of smoke and flame was then pouring. The dry-as-tinder wooden 'tween-decks—doubtless, in the usual Chinese way, strewed with combustible materials, besides the ammunition needed to work the guns—had been ignited by the bursting of almost our last shell, and the after-end had already commenced to burn fiercely. My master-gunner—his wounds forgotten—was now yelling madly at seeing his patient persistence at last rewarded, for the terrific wind-squall that rushed in through her shattered stern quickly fanned the flames beyond any chance of extinction by the neglected hand-pumps and rotten hose of a Chinese-owned steamer. Very soon afterwards smoke and flames were belching forth in volumes from the whole after-part of the pirate. Silhouetted against these dozens of human figures were sharply outlined, apparently engaged in a desperate attempt to check the progress of the fire amidships ; whilst all her guns were now silent. Then, very suddenly, there came a blinding radiance, followed by a roar that even the howling of the wind could not deaden, as great clouds of grayish-yellow smoke streaked with flame rose, carrying with them high into mid-air fragments of metal and woodwork. For a moment her great funnel stood out, seeming red-hot in the fiery furnace her torn and rent hull had become, ere it heeled over and buried itself amidst clouds of steam under a seething cauldron of angry surges that instantly closed above it. The store of good British powder

she carried had sent the steam pirate to her last account!

My men were, like myself, for the moment dazed by this awfully sudden catastrophe; but just then—as sometimes happens—a momentary lull in the fierce gusts preceding the typhoon gave us our chance, and that demanded instant action. The pumps were set agoing, the wounded got to their berths, the deck cleared of wreckage, the guns secured, and all then possible was quickly done to keep our little vessel afloat till shelter should be reached; whilst I anxiously scanned first the barometer and then the outline of the distant land through my night glass. For there was a sheltered anchorage less than a league away that, could we but reach it before the full fury of the typhoon burst upon us—which seemed extremely doubtful—would spell safety. The problem was to get from the shelter of the land to that of the creek we were making

for, across a dangerous and exposed stretch of sea, where, if our engines broke down under the strain, we should be quickly driven ashore and ground to matchwood on the rocks. On the other hand, if the pilot and quartermaster failed me at the helm we should just as inevitably founder.

The spectacle that the battle of the elements then presented was most grand and awe-inspiring. Still, I never in my life felt more thankful than when it was shut out in the dense blackness and close, humid calm prevailing in the tiny landlocked creek into which the little vessel had leapt lightly out of the tempestuous inferno raging behind her, passing through its narrow channel to sudden security.

We had both accomplished our mission and saved the Viceroy's sorely tried little gunboat from the greedy maw of one of the most terrible typhoons that had ever visited the China coasts.

THE MONTH: SCIENCE AND ARTS.

A TALKING-MACHINE.

IT is somewhat remarkable that the talking-machine, although it has attained such an enormous vogue, has undergone but very little development since it first appeared upon the market. From time to time minor improvements have been carried out, but they have been so trivial in character as to escape appreciative attention. To-day the talking-machine remains, as it ever was, purely and simply a mechanical musical instrument, void of all expression and tonal qualities. A record, no matter how well it may be produced, soon grows tiresome and monotonous, simply because it is entirely lacking in feeling, and does not interpret the artiste faithfully. This disability is inherent. Expression has to be ignored to a very considerable extent during the task of producing or recording, because the sound-line, into which the effects of a full orchestra have to be compressed, is of microscopic proportions. Some idea of the dimensions of this sound-line may be gathered from the fact that the groove represented thereby, which is cut by the recorder in consonance with the movement of the diaphragm to which it is attached, is only four-thousandths of an inch in depth; while ninety of these grooves, including the intervening space between them, go to a square inch. The diaphragm is not particularly sensitive; whilst the fact that sound has to be translated into a line accentuates the difficulties of preserving the true tonal value of the music. Unless ample force is imparted to the instrumental or vocal rendition it will fail to be recorded; consequently the claims of expression must be ignored almost entirely. In reproduction an effort is made to veil these

defects by utilisation of loud, soft, or medium toned needles; but these do not affect the monotony of the sound—they merely influence its volume. Of the three needles, the first-named, or loud, is preferable, inasmuch as it brings out all that there is in the microscopic sound-line; on the other hand, when a soft needle is used much of the lesser or lighter irregularities in the sound-line, each of which has a distinctive tonal value, is lost or blurred. These drawbacks have recently been overcome by means of an interesting invention which has been incorporated in an improved talking-machine known as the æolian-vocalion, which is of so far-reaching a character as to convert the monotonous reproducing machine into a living mechanical musical instrument. Fundamentally the new machine follows the familiar lines, though distinct improvements in details have been effected. But the parting of the ways is brought about by a device known as the graduola. While the record is produced in the usual manner, and is void of all expression, in reproduction by means of this new attachment a faithful impression of the work according to the ideas of the vocalist or the composer is for the first time rendered possible. The most delicate variations in light and shade may be obtained. The graduola is manipulated by hand, and the control, which is extremely simple, cannot fail to appeal to all of artistic musical taste. If desired, the graduola attachment may be ignored, in which event the rendition of the record is similar to that of the conventional talking-machine. But the circumstance that real and accurate pianissimo effects may be secured without the sacrifice of any of the partial tones will appeal to all music-lovers. The æolian-vocalion represents as marked an

advance upon the conventional talking-machine as is the piano-player in relation to the barrel-organ.

SHALL WE HAVE THE METRIC SYSTEM?

The war has been responsible for the revival of the perennial controversy concerning the adoption of the metric system by this country. But the issue is no longer only of academic interest; it is being regarded in a far more serious and concrete manner. Our industrial circles realise the fact that the struggle for commercial supremacy is certain to be more vigorous and relentless upon the conclusion of hostilities, more particularly in what are now the neutral countries. It is somewhat interesting to observe that the metric system is meeting with greater favour to-day than at any other period of the agitation. Yet there is a considerable diversity of opinion as to the extent and manner of its adoption. The extremists maintain that decimals should be used *in toto*, both in regard to weights and measurements and to coinage, and that the prevailing arbitrary British measurements and coinage should be abolished. The opponents prefer the prevailing system, under the plea that it has sufficed up to the present time, and will enable British ideas to secure a still wider appreciation. On the other hand, the middle section—and this is the great majority—suggest the use of both systems in regard to weights and measures and the retention of the British currency standard. The latter appears to be the logical solution of the problem. It involves no legislative assistance, and secures the survival of the fittest among those competing for the world's trade. The supporters of the present idea point out that the adoption of the decimal system in its entirety would involve tremendous expense, while the quotation of prices in the coinage of the country whence orders are solicited would prove impossible owing to the wide fluctuations in exchange. It must be admitted that the question of translating the British sovereign into any particular currency is a simple process at the moment, and the retention of the British currency standard should strengthen our position as the dominating factor in the world's financial market. But the decimal system in relation to weights and measurements has undergone considerable development, a result primarily due to the fact that we are being called upon to supply commodities to France and our other Allies in accordance with the metrical method of calculation.

ANOTHER PNEUMATIC LIFE-SAVING WAISTCOAT.

Two paragraphs were printed in our 1915 volume on 'Life-Saving Garments' (pages 272 and 334). Amongst those which have attracted public notice as the inevitable consequence of certain marine disasters both mercantile and

naval, the waistcoat which depends upon air as the buoyant medium appears to have received the greatest meed of appreciation. So far as the men engaged in mine-sweeping are concerned, the authorities have insisted upon every man being provided with a life-saving collar, which must be worn constantly. At the moment of danger this collar can be inflated by merely blowing it out with the mouth, and sufficient support is offered to ensure the head being kept above water. But the life-saving waistcoat is maintained to be preferable both by officers and men. It resembles an ordinary waistcoat, fulfilling all the requirements of that garment, but with the additional advantage that when a crisis develops it can be blown out speedily and easily by the mouth. Full inflation is possible within twenty seconds, and it enables the head and shoulders to be kept above the water for an indefinite period. Moreover, the buoyancy is not only adequate for the support of the wearer, but it will sustain one or two others clinging to him if necessary. This life-saving device has established its possibilities very conclusively in connection with the naval disasters which we have suffered in the waters washing the Gallipoli Peninsula. The fact that it can be worn constantly in the usual manner, and without causing the slightest inconvenience, combined with the circumstance that it can be brought into action so readily, has appealed to the men manning our ships, who realise that therewith they have a fighting chance for their lives if their ship is sunk beneath them.

COVERS FOR DOUBLE-DECKED OMNIBUSES.

One of the objections to the double-decked omnibus is the discomfort attending travel in wet weather. Several suggestions for protecting the outside passengers against inclement weather have been advanced, but they have been generally rejected because of the apprehension that they would render the vehicle top-heavy. Experiments are now being conducted in London with a collapsible hood such as that generally carried upon touring-cars. It is a light canvas waterproof covering fixed to the side-rails, and running from back to front. When extended it covers the whole of the vehicle, but when out of use it folds back and lies out of sight on the roof of the canopy over the driver's seat. When it was first submitted to a practical trial, the fear was entertained by the authorities that the canopy would endanger the safety of the vehicle owing to the increased resistance it offered to the wind, and the thought was expressed that the omnibus might be overturned if struck broadside by a sudden heavy squall. Recently further trials have been carried out in very windy and inclement weather, from the results of which it is obvious that the safety and stability of the vehicle are not affected by the extended hood. Under these circumstances it is anticipated that

the authorities will offer no objection to the employment of the sheltering device.

MUSIC FROM LIGHT.

Some two or three years ago Professor Duddell fascinated, instructed, and amused a young audience at one of our scientific institutions by playing musical airs upon the electric arc. Now it appears that the incandescent electric lamp has been harnessed in such a manner as to enable music to be produced as required. This end is achieved by means of what is known as the audion, or wireless lamp, which plays such a prominent part in wireless telephony between Arlington, Hawaii, California, Paris, and other distant parts. This incandescent lamp is stated to be capable of producing music from light owing to the fact that it acts in a manner somewhat similar to the transformer, whereby direct is converted into alternating current. When an ordinary telephone receiver is introduced into the circuit, the alternating current imparts such a vibration to the diaphragm as to induce the latter to emit a certain musical tone. By varying the intensity of the current supplied to the lamp, the inventor claims that it is possible to vary the tones within such wide limits and so delicately as to render possible the production of a musical composition.

FOOD AND HEALTH.

An interesting contribution to the relationship of food to health has been made by Dr M. Hindhede, the Director of the Danish State Laboratory for Nutrition Research. The doctor, who has made a very intimate study of his subject, first claimed attention because of his attack upon the proteid or albumen body-building fetish, which was the subject of his volume *Protein and Nutrition*. Recently he has made another contribution to the subject in *What to Eat, and Why* (Heinemann). While there are innumerable people who will not agree with the Danish doctor's theories, the book certainly deserves perusal from the fact that Dr Hindhede is not a dietetic faddist. He is not a rigid vegetarian, but he is an enthusiast in the art of economical living. Thus, for instance, while he regards meat and fish as indifferent food-stuffs, his reason for so doing is not hostility to them as articles of diet, but because insufficient value is obtained for the money expended; or, put in other words, as one is able to partake of other comestibles which are fitted to perform the same body-building work at a lower cost, he maintains that these should be eaten for preference. A similar broad line of thought pervades his recommendations in connection with beverages. He suggests that barley-water and orangeade are the most satisfactory and health-giving liquid refreshments, more particularly the latter, which contains an appreciable proportion of alcohol,

though the percentage is not so high as in beer. In his latest volume Dr Hindhede provides a plethora of cooking recipes and rules, which have the charm of infinite variety, and which incidentally bring home the fact very significantly that he is by no means animated by any faddist principles, since his dishes range from vegetable soups to potato chops, in which pork predominates, and Irish stew made with or without meat, as well as steak and kidney pudding. There is no doubt but that the average Britisher is a heavy eater, and is far from being economical in matters pertaining to diet. But the exigencies of the moment demand that greater attention should be paid to the question of cost than has been the case within the recollection of the present generation. Articles of food which have hitherto been considered indispensable, such as meat and fish, have risen much in price. The primest meat is now beyond the reach of the average person, who has naturally turned to the inferior article. A perusal of Dr Hindhede's guide to the question will speedily convince one that exceedingly cheap and appetising dishes can be prepared in which meat is either entirely absent or used only in small quantities and to profitable advantage from the body-building point of view. As a matter of fact, this work recalls the eminent vegetarian who, while a zealot in opposing meat as a food-stuff, was a victim to the failing that he could never eat potatoes unless they were served with an abundance of rich, toothsome gravy, thereby fulfilling in a certain measure the generally accepted scientific theory that it is preferable to consume about 50 per cent. of animal and vegetable proteids to bring about the easy and complete digestion of both.

SOLDIERS IN STEEL.

As the great contest proceeds one cannot fail to speculate as to whether we have really advanced in the art of war. Light steel helmets have been introduced into the armies of the Allies to protect the head from shrapnel, while masks are donned to ward off the asphyxiating effects of noxious gases. The latest development in this direction is the perfection of the bullet-proof cuirass which is now being worn by our soldiers. Although this protective device does not appear to be supplied by the authorities, apparently there is no official objection to its use, and anxious relations and friends at home are supplying the members of their families and colleagues in the firing-line therewith. Experience has proved that a high percentage of casualties in the field are due to spent and ricochetting bullets, splinters of shells and grenades, as well as fragments of stones, and so forth, which, striking the body in the vicinity of such vital parts as the lungs, heart, and principal blood-vessels, have sufficient impetus

to tear through the ordinary woollen clothing and inflict ugly wounds, but which could be successfully warded off were a protective device worn. This fact has been responsible for the perfection of the new body-shield, which is made of a specially prepared toughened metal disposed in four plates, strengthened at the joints by steel strips, the whole being covered with khaki drill. The shield is made to the shape of the front of the body extending from the neck to about the waist-line. The shield may be either in single or double form, the former being for the chest only; while the latter, in addition to the chest-protector, includes another section shaped to the back, the two being joined together by curved metal plates to fit the shoulders. In this instance the shoulders are protected from downward sword-cuts. The shields, which measure twelve by eleven inches, and weigh about twenty-nine ounces, fit comfortably, and can be worn beneath the tunic. Owing to the shape, there is no impediment whatever to any free movement, and the metal has been found to be sufficiently tough to turn the thrust from a bayonet, sword, or lance.

THE SUGAR-BEET SITUATION.

One of the penalties of war so far as the housewife is concerned is the high cost of sugar, although this commodity is very slowly falling in price. The shortage of sugar has been responsible for a revival of the proposal to establish the beet-sugar industry in this country. As is well known, this movement is merely in its infancy; and, although progress has been recorded, it is not particularly pronounced. But the past season has been wonderfully successful in the eastern counties, despite the fact that the conditions have not been favourable. Efforts have been made to extend the new industry, and to bring about its development in other parts of these islands. Trial plots have been sown, and have been deemed to be completely satisfactory. Attempts have been made to secure Government assistance in order to place the industry upon a firm footing, it being pointed out that the greatest producer in this line of industry being now involved in the war, and unable to export its produce, the occasion is particularly opportune to bring this country into a position to meet the keen competition which must arise after peace is declared. But the Government, while sympathetic, does not seem disposed to respond to the call. So far as these islands are concerned, the beet and cane sugar industries are certain to come into conflict. Certain of our colonies are large cane-sugar growers, and official stimulation of the beet-sugar at home, at the expense of the colonial growers, would meet with hostility on the plea that unfavourable preference would be shown to the beet-growers. At the same time, however, it should not be impossible to adjust the situation in such a manner as to avoid

conflict, although the task would prove somewhat delicate. The suggestion has been advanced that the Government should control the factories and refineries, and should buy the raw material at a fixed price. Thus the output of the beet article could be kept down to the level necessary to make good the balance between supply and demand, which the cane article cannot possibly fulfil. A parallel with the butter and butterine crisis of several years ago arises. The dairying interests vehemently and successfully opposed the utilisation of the name butterine, maintaining that the substitute for the milk product should be known under a distinctive name, which could not possibly be confused with that of the genuine article. The situation was finally settled by the coining of the word 'margarine' to distinguish the substitute. The remarkable development of the margarine industry suggests that, if a generic name were evolved for beet-sugar, greater success would attend its production. An article on 'English Beet-Sugar' appeared in this *Journal* for 1910, and another on 'The Sugar Position' in the volume for 1914.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE LIVING FAR AWAY.

It's not for them that's dead that I'm weepin' now,
For somehow they seem nearer, now my life is runnin' low;
There's the stars come out in heaven,
Each a gold speck in the gray,
An' the dead seem nearer somehow though they be so far away.

It's for them that's through the world that I'm weepin' now;
An' I not knowin' where they be, though I break my heart to know.
Och! the longin' that comes over me,
As night shuts out the day!
Ay, the dead seem nearer somehow than the livin' far away.

But och! it's *once* to see them that I'm longin' now;
An' sure they're not forgettin' the old times anyhow;
But it's hard to be writin' letters
With the world an' all between,
An' work to set your hand to, an' new friends where old have been.

Dear folk that I've been lovin', that I'm lovin' now,
The breakin' of my heart's the prayer I'm sendin' up for you;
It's my heart's blood shed in longin'
An' in silence day by day!
Ay, the dead seem nearer somehow than the livin' far away!

MARY PATON RAMSAY.

SEVENTH SERIES

SINGLE-HANDED.

A STORY OF SCIENTIFIC HEROISM.

By WILLIAM CANON.

CHAPTER I.

JOHN CRANE, marine engineer, sometime of H.M. Royal Navy, sat in a wicker chair on the broad hotel veranda, indulging in the futile but very common amusement of wishing that to-day were to-morrow. He had finished the commission that had brought him to this now half-deserted port of Coatzacoalcas, on the coast of Mexico, and only awaited the mail-boat which would arrive next day. He greatly desired to be back in New York, for his resignation had already been accepted by the great shipbuilding firm with which he had been employed, and his arrangements were all made for returning at once to England and offering his services to the Mother Country.

He was still young, active, and very strong; the wish in his heart was that he might be sent to the front. But his mind told him that his proper place was in the great shipyards on the Tyne, where the clatter of hammers on steel went on night and day, and men strained nerve, brain, and muscle to repair the broken ships that limped in from the North Sea, and to turn out new steel gladiators, that England's grip on the Seven Seas might not be loosened. He knew that his services would be eagerly welcomed by the Naval Board, as he had made a name along certain lines of marine construction that quite belied his youthful appearance.

His mind was still occupied with the contents of the week-old newspapers scattered at his feet, which chronicled the disappearance of a number of British vessels plying between Australian and Oriental ports and the west coast of the United States. Ten or twelve ships were now long overdue, and there were rumours that wreckage, appearing to belong to his Majesty's light cruiser *Guernsey*, had drifted ashore at Tahiti. Fears were expressed that there was still a swift German cruiser at large in the Pacific, despite a statement by the Admiralty that every German war-vessel had been fully accounted for except those in German home waters. This statement laid the blame on a severe cyclone that had lately raged in mid-Pacific.

It was a quiet scene that met his eyes as he looked from the veranda over the luxurious

tropical verdure of the courtyard, across the town with its polyglot mixture of old native and modern commercial architecture, to the long docks and railroad yards that bordered the bay. The opening of the Panamá Canal, the European war, and the chaotic conditions in Mexico itself had combined to reduce the once great traffic through this, the Atlantic port of the Tehuantepec ship-railway, to a fraction of its former proportions. A single ship was unloading at the docks, a rusty tramp steamer flying the flag of Holland.

The rays of the sun were by now slanting well from the west, and Crane stood up and shook himself, deciding on a stroll before dinner. He walked down the narrow cobbled streets, lined and peopled with the curiously mixed evidences of native indolence and foreign industry, until he gravitated naturally to the docks, where he strolled about with an interested professional eye on the unloading of the Dutch steamer. His habit of close observation and his retentive memory of small details had played a large part in his successful career. He had the typical engineering mind that is constantly on the alert for better ways of doing things, and neglects no point, however small, which leads to that end. So he watched keenly the work of the gigantic steel cranes, their tons of metal skeleton animated by the small human being who sat in a little box on the neck of each, with his row of levers before him. There was something almost eerie in the way they swung out over the deck, dropped a mighty arm through the ship's hatch, grasped a titanic handful of boxes and bales, and, swinging back again, deposited them gently on the dock-floor, where they were pounced upon by the porters, who, like a nest of busy ants, trundled them back into the warehouses.

As he walked along among the piles of freight, his quick eye noted something of interest, and he stopped to examine it. It was only a small metal band or clamp on the joints of a long, narrow, wooden box. It was the shape and construction of these iron bands that had caught his eye. They were admirably designed for the purpose, and something about them seemed familiar to him. They had a peculiar arrange-

ment of small metal claws to engage the wood; and he was positive that, sometime and somewhere, he had seen them used before. The box on which they were used was some three feet square and fifteen feet long, and there were about twenty like it in the pile. Besides certain cabbalistic consignment marks, it bore, stencilled in English, the words, 'Terra-cotta. Fragile.' The thought ran through his mind that the boxes probably contained ornamental columns for the palace of some successful trader or petty ruler on a coral island of Oceania. He resumed his walk back to the hotel; but the thought of the iron strap-bands kept coming back, for his memory could not place their association, and did not like to admit a lapse.

The same thought came again next morning as he splashed in his bath, happy that he would soon be sailing north across the Gulf, bound to throw heart, mind, and body into the great war-game; and something, possibly the stimulus of the cold water, brought the answer like a flash. He had seen those straps before in the town of Essen, in Germany, where are located the great Krupp gunworks. Many years before, while filling his first billet in a Belgian shipyard, he had made several trips into Germany, observant, as always. It was at the Krupp works that he had seen cars loaded with boxes carrying those peculiar bands, and had earned a reprimand from a watchman for examining them too closely. This explained the strange uneasiness that had affected him on seeing them again. Of course, commercial manufacturing concerns had undoubtedly come to use them. It was a good clamp for heavy boxes. He put the matter out of his mind, and went down to breakfast.

But the stubborn thing would not stay out. Why had he not seen that strap since the first time until now? He had seen hundreds of cargoes unloaded in all parts of the world. He had examined the packing of thousands of parcels of sea-freight, had written technical articles on the subject; it was one of his hobbies; and never, since he was at Essen, had this particular form of iron strap passed under his eye till now. It was very strange.

Then the waiter appeared with fresh papers. The mail-boat had come in during the early morning; she would sail at noon. He glanced over the papers, and his sense of uneasiness began to take shape. There was more about the mysterious non-appearance of ships in Pacific waters. The list of the overdue was longer; a boat belonging to one of them had been found waterlogged, its stern torn away, with the body of a sailor, who had evidently been killed by a bullet, entangled in its painter. There were conjectures that a German cruiser had slipped through the North Sea cordon and into the Pacific by unfrequented routes; that she was probably interning the crews of sunken vessels on some remote island. British and Japanese

war-ships were scouring the archipelagoes for traces of the supposed marauder.

As Crane ate his breakfast these things kept running through his mind, and, tangled up with them, the incident of the strap iron bands, which quite refused to stay down. Soon he finished the meal, paid his bill, saw that his luggage was placed in the mail-boat pile, then took up his hat and struck a rapid gait for the docks.

The Dutch freighter was gone and her slip lay empty. The freight had all been removed to the warehouse between the dock and the railroad tracks. However, a door stood open, and he walked into the cool, gloomy room. There were the boxes all right, piled near the opposite door. He started toward them, but a voice stopped him.

It was a Mexican watchman, who had been sprawling on a pile of freight. He was a ragged, dirty little man, but a serviceable-looking rifle leaned against the wall beside him. He was saying, '*Buenos días, señor.* Is there something you desire?'

'I simply wanted to check that pile of boxes before leaving, to see that they are all there,' answered Crane readily.

'I beg the *señor's* pardon. Perhaps he has a permit from the superintendent?'

'No, I haven't time for that. I must catch the mail-boat,' answered Crane, as his hand went to his pocket, and came out with a silver *peso*.

The man shook his head, though he eyed the silver wistfully. 'I am sorry, *señor*. Any one entering the warehouse must have a permit. It is orders.'

'Oh, come!' said Crane, as he pulled out four more of the coins. 'The boat leaves in a few minutes, and I probably can't get a permit and be back in time.' And he jingled the coins seductively.

But the watchman was firm. 'I am a poor man, *señor*, with many children. Who am I that I should break the orders of the superintendent? I should probably lose my place.'

Crane walked slowly down the dock. He had had some experience with Latin-American officials; he knew that failure to accept a bribe could usually be traced to a larger counter-bribe, or unusual pressure of some kind. He sat down on a pile, in sight of the door, but some distance away, and stared at the murky, greenish flood that heaved in oily undulations below him. This thing was getting on his nerves. All his inclinations were toward the mail-boat, and a quick voyage north and east. But a number of unformed and exasperating suspicions tugged the other way.

As he sat pondering, two men came down the dock from the direction of the harbour-master's office. One was a dapper, alert fellow, in the uniform of the Tehuantepec Railway Company; the other was a tall, dark man, dressed like a

ship's officer in the freighting or coasting trade. But there was something about his gait and carriage that aroused in Crane the same sensation as those peculiar iron straps had done. The two turned into the warehouse, and Crane arose and sauntered past the open door. Glancing in, he saw the tall man standing by the pile of long boxes, evidently checking them off by a paper in his hand. The watchman was talking volubly to the railway official, and Crane quickened his pace till he struck the crowded side-walk which led to the mail-boat, now almost ready to leave the dock. As he raced along he came to a quick decision; and when the *Galveston* pulled in her gang-planks, a few minutes later, John Crane had already retrieved his bags, packed them into a rickety closed cab, and was rattling over the rough streets to a rather obscure hotel on the other side of the town.

Having engaged a room, he retired to it, and proceeded to change into a suit of heavy, work-stained garments which he often wore in the rougher work of his calling. With heavy boots and a battered hat pulled down over his brow, he looked very different, as he slouched back to the water-front, from the spick-and-span young professional man of the morning. The watchman whom he had attempted to bribe a few hours before looked at him without a flicker of recognition as he passed the warehouse door. A casual glance inside assured him that the long boxes were still there.

He lounged around the docks for a couple of hours, studying the shipping in the harbour and keeping an alert eye for the big seafaring man with the military bearing. A British freighter was taking in a cargo of cocoa, coffee, and hardwoods from the interior; and a refrigerator ship of the United Fruit Company's Line, fed by two giant cranes, was making a gargantuan meal on bananas. A few small coasting-vessels were coming and going; while a trim white yacht, with gay awnings shading a white-clad group, showed by the Stars and Stripes at her masthead that some American gentleman of leisure was sojourning here. Not a suspicious note marred the peaceful activity and tropic indolence of the scene.

As he wandered back by the end warehouse about five o'clock, however, he saw something that galvanised him into activity. A train of cars had been run alongside the warehouse, and a gang of porters were busily engaged in loading the long boxes, with other merchandise, into them. Also, the big, dark man was there, overseeing the work and evidently enforcing special care in handling.

John Crane walked rapidly back to his hotel, but stopped at a second-hand store to make some purchases. He knew that the next train across the isthmus to the Pacific side would leave in half-an-hour, and would already be made up. Those cars, then, could not be a portion of it;

they would probably leave the next morning. When he hurried back and caught the train he was dressed in the soiled dungarees and cap, and carried the dunnage-bag, of a common sailor. Carrying out the part, he purchased a second-class ticket, and passed an uncomfortable night in a reeking day-car.

Arrived in Salina Cruz, the Pacific port of the Tehuantepec Railway, in the early morning, he secured a room in a sailors' boarding-house near the water-front, deposited his bag, and, after assuring himself that the lock on the door was a serviceable one, dropped the key into his pocket and set out for a tour of inspection.

Along the docks several small coasting-steamers were discharging or taking on freight. The big cross-seas freighters which, before the days of the Panamá Canal, had picked up the burdens laid down by their Atlantic mates on the other side of the isthmus were conspicuous by their absence. He visited each of the coasters, making casual inquiry for work. Everything seemed entirely regular. Only three ships lay at anchor in the harbour. At a ship-chandler's he was told that two of them awaited overhauling at the dry dock. The other was the *Cocos*, a Dutch pearl and copra trader from the Islands—something rather unusual in this port.

He picked up a glass from the counter and examined the *Cocos* with interest. She was a ship of some thousand tons burden, low in the water, and rather narrow in the beam and keen in the stem for a trader. She was painted a dull gray, except for a broad red band around her hull at the portholes, and her two funnels were red and black. She carried the flag of Holland. A number of sailors were busy on her deck, and Crane noted that they were all white men, a noteworthy fact, since the bulk of the crew on most ships in the copra trade is made up of Kanakas and other Island natives. Crane loafed around the water-front all morning, ate his lunch, then retired to his room for a *siesta*—very welcome after his sleepless night on the train.

About five o'clock he sallied out, still dressed in his sailor's dungarees, and went back to the docks. He found the Dutch ship at the wharf, and the reeking stench of shell that met him as he approached left no room for doubt that she was a pearler. She had unloaded some shell and copra, though a small cargo for her tonnage. She was now taking in supplies and the ordinary assortment of Island freight, a large part of which consisted of kerosene-oil in wooden cases, each case containing two five-gallon tins. A big hose writhing across her deck was filling her fresh-water tanks; while a close scrutiny discovered another big hose passing under the dock to a valve below her deck-line, and this, he knew, conveyed crude oil. 'Must be a small quantity for her donkey-engines,' he thought; for an oil-burning Island trader would be a novelty, and

the smoke floating lazily from her funnels showed that she was a steamer; also that she had steam up and did not intend to linger long. Her crew, busy with the cargo and routine work on deck, were all white men, so far as he could see; a stocky, heavy-set lot, many of them bearded. Not an Islander was in sight. The portholes were closed by wooden shutters outside the glass.

Crane walked boldly up the gang-plank, but as he reached the deck he was accosted by a seaman at work near by. Speaking in Dutch, the man asked his business. Thanks to his four years in Belgium and Holland, Crane could speak Dutch like a native, and was also proficient in German. Constant contact, in his work, with men of these nations, and his natural habit of doing well anything he did, had kept his linguistic abilities at par. Now he answered in German, but the man shook his head. So, feigning to speak only a smattering of Dutch, he laboriously explained that he wanted to see the captain. This, the man said, was impossible; the captain was ashore, he did not know just where. Crane asked for the mate. He wanted work, he said in broken Dutch. The ship was full-handed, replied the man; and as Crane kept edging across the deck he roughly ordered him back to the dock, saying that no one was allowed on board except on business. So Crane, making the best of a bad job, turned and sauntered away.

He now headed for the railway station, as the train from the Atlantic side was due at six o'clock. Slouched on a truck, he watched it pull in. There was his man all right, the first off the steps. He struck a smart gait for the docks, and Crane, following at a discreet distance, saw him go straight up the gang-plank of the *Cocos*, touching his cap in response to the salute of the sailor near its head. Crane disposed himself on the shady side of a pile of bales, and settled down to watch developments.

The first came in half-an-hour. A puffing switch-engine backed a string of cars down the warehouse track, a car door was opened, and the stevedores swarmed in. They began to unload freight from trucks and wheel it directly aboard the ship, where a donkey-winch lowered it into the hold, as the big dock cranes had stopped at sundown. The deck was brightly lighted with electric globes, and hummed with activity. Evidently she would finish loading and sail in a few hours. Crane sprang to his feet and hurried uptown.

One after another, he visited several ship-chandleries, second-hand stores, and pawnshops, and made a strange assortment of purchases. Then he hurried to his room; and when he left it, a few minutes later, the dunnage-bag he carried was both bulky and heavy.

He slipped quietly down to the docks, avoiding the brightly lighted places, and sought out a

landing-stage in a dark corner, where he had marked, during the afternoon, several small skiffs tied up. Placing the bag in one of these, he cast off its painter and pushed it back under the dock, then paddled cautiously along between the piles toward the Dutch ship.

The velvety-black tropic night had now descended. He felt his way along with the prow of the little boat, through the warm stench of rotting piles and the echoes of the water lapping against them. Presently the *Cocos's* bulk cut off the starlight outside, and he located the gang-plank by the rumble of the trucks overhead. Here he tied the boat to a brace, and climbed carefully up its slippery length till he reached the cap timber, on which rested the sills of the wharf-floor.

In the black darkness he worked his way along on the narrow, slippery timbers till he reached the edge of the wharf and found footing on the walling strips against which the ship's hull rested, rubbing slowly up and down with the slight swell of the harbour waters. Then he felt along her side till he located the cover of one of the portholes.

His exploring fingers soon told him that this cover was of wood, with heavy iron hinges, and was fastened inside. He had seen similar ones many times. So he produced from his pocket a Yankee tool-set, with numerous small tools concealed in its hollow handle. He selected a thin steel blade, fixed it in the handle, and set patiently to work; he had no desire to excite suspicion by leaving a plain trail behind. After about ten minutes he had the satisfaction of hearing the bolt slip back; he cautiously prised the cover outward till a gleam of light showed through, then applied his eye to the crack. What he saw brought an exclamation from his lips a good deal louder than he could have wished. He had rightly guessed that this porthole looked into the engine-room; and he knew that he could judge a ship by her engines as a racehorse by its legs or a wrestler by his shoulders.

The room into which he gazed was extra large for a ship of this size, and was literally filled with massive machinery. A single attendant lounged beside a small motor which hummed quietly in one corner, supplying the lighting system. The electric lights glittered on polished metal, and showed everything spick and span as the power-plant of a millionaire's yacht. Moreover, he saw that these were not steam-engines at all, but large internal-combustion engines of the Diesel type, which has been brought to great perfection in Germany in recent years. These massive units were evidently of tremendous power for so small a ship, and must render her capable of extraordinary speed. Using crude oil as an automobile engine uses gasoline, they dispensed with coal-bunkers, boiler-room, and stokers, giving space for fuel-tanks of great capacity, and

giving the ship a correspondingly wide radius of action. Also, she could be rushed into full speed at a moment's notice, without awaiting the slow process of getting up a high head of steam. A most remarkable power-plant, truly, for an Island copra-trader.

Another thing he noted, for he remembered those red-and-black funnels and the smoke floating from them. There was a small furnace

amidships, from which two pipes ran up through the ceiling. Doubtless a smudge was kept up in this whenever it was desired to complete the illusion of the funnels. Such deliberate plants to create a false impression could be for no honest purpose. This thought ran through Crane's mind as he looked, and hardened his determination to see this matter through.

(Continued on page 92.)

ROUND ABOUT RIGA.

By KATE DOWNING.

NOTWITHSTANDING the fact that I was for several successive summers in Courland (in which province the enemy is at present engaging the Russians), I never managed to see anything in the holiday season of the neighbouring province of Livland and the beautiful valley of the Aa. I had paid several visits to Riga in winter-time; but my summers had been spent at country estates in Courland, and over and over again my friends there would say, 'You must not go back to England without seeing the Aa valley.' I fully intended doing so before leaving Russia; but, alas! the fates upset all my plans, and compelled me to return sooner than I had anticipated. What could not be accomplished when so near was most gloriously realised four years ago in a short summer holiday while I was visiting the pretty, pine-scented seaside resorts south of Riga and the interior of Livland. Only a few versts from the busy and interesting port Nature has chosen a spot where, in miniature, her choicest handiwork is to be seen, and no one who has an opportunity of visiting the coast should leave without spending a few days in the beautiful valley of the river Aa, the Dūna's pretty tributary. A few days, I said; but if time is no consideration, and the temperament one that can take delight in living the quiet and simple life in a bypath hitherto untoured except by its own countrymen, then the days may be lengthened at will. If it is a case of health, especially that of a nervous breakdown, I can imagine no place on the face of the earth better suited to restore man or woman to a normal condition than a leisured visit to this beautiful and interesting corner of Russia. No one thinks of scenery in connection with Russia; and, strange as it may seem to us, Russians do not think of scenery in connection with England! I well remember asking, many years ago, some Courlanders, who year after year travelled in Switzerland, the south of France, and Italy, why they never came to England for pleasure and to see the scenery. 'Go to England for pleasure!' was the exclamation. 'We never think of England for a pleasure-trip; people only go there for business.' Such is the reputation of our land among the Russians who do not

know it, and we have equally wrong notions about them and theirs. All that is wanted to correct these mistakes is a better personal acquaintance; and the sooner this takes place between us and our great Ally the better for mutual benefit.

Lake, river, hill, and glorious forest scenery diversify the landscape of the plateau watered by the Aa, all features enchanting the eye simultaneously. But, with the exception of the trees, none are to be found on a large scale, as in Switzerland and Norway. Compared with these countries, it is the diminutive, the tranquil, the peace-filling world of nature, rather than the big and awe-inspiring, which allures in Livland. From the coast eastward the land rises in a series of terraces and tree-covered plateaux, from the surface of which spring hills to a height of four hundred feet, seven hundred feet, and even one thousand feet. Intersecting the plateaux are valleys descending as narrow gorges right down to the river Aa, which has hollowed out, and is still deepening, its bed through the elevated ridge which runs through the heart of the province. Between its tree-clad banks, sometimes steep and sometimes gently sloping, it winds its serpentine course amidst romantic scenery, culminating in the part known as the Livonian Switzerland, distant some fifty versts (about thirty-four miles) from Riga, and reached in two hours—railway travelling in Russia is not exactly express speed, and you must possess your soul in patience—by train to Segewold (two shillings second class), at which unpretentious wooden station, as is universal in Russia, excellent food can be got, no matter what the hour. Travelling from Libau to Riga, I recall more than one long midnight wait at Moscheiki, an hour of which was well spent at the inviting supper-tables, a varied supply of well-cooked *à la carte* dishes being ready and quickly served. And on another occasion, on our arriving at five o'clock in the morning at Tuckum, a small junction in the north of Courland, coffee, rolls, butter, and cakes were ready. Very different has been my experience coming in the early morning into Rugby Station by Scotch or Irish express, and waiting some two hours

before even a cup of tea could be got. But comparisons are——

Segewold, the starting-point for a tour in the valley of the Aa, is much frequented during the summer months. There are two well-known hotels and four or five *pensions*. The tariff at the largest of the latter, which consists of four houses, is from ten to thirty roubles (one to three pounds) for a bedroom per month; for board, at the rate of one rouble fifty copecks to one rouble seventy-five copecks (three shillings to three-and-sixpence) a day. The walks and the scenery at and around Segewold are lovely; but in addition to the delights of nature there is here, and farther on at Kremon, Treyden, and Wenden—'the Pearl of Livonia'—much historically to interest the student, native or foreigner, since in the many ruined castles, towers, and churches, pages of the province's past vicissitudes are to be read. For Livland has waged wars and fought and struggled with neighbours within and without its borders—Poland, Sweden, and Russia having singly, and sometimes all together, devastated the land. But that is another story. For the moment I am only concerned with relating my reminiscences, and giving the impressions of a first visit with a *Rigenserinn*.

Leaving Riga on Sunday afternoon at four o'clock, we arrived at Segewold soon after six. But if slow, the train journey was not, to me, in the least boring. The Letts were in their modern Sunday best. A young man in our carriage had on a good cloth suit, a superb tie shaded green, brown, and heliotrope, brown boots, and—no stockings! Intending to return to Segewold the next evening, we took a *liniendroschky* to drive to Treyden, situated on the other side of the Aa. This was the most interesting drive I ever had in my life, and, next to another taken in the early morning a few days later, the most enjoyable. Never shall I forget the first glimpse of the Aa, winding through the beautiful valley, its wooded banks on the one side rising here and falling there to show dark ravine or gloomy gorge. A halt was made to have a look at Prince Nikolai Krapotkin's fine estate (a spot round which during many centuries local history centred), and then on we went, jolting along the roughest of roads. The speed at which we drove across a sandy expanse descending to the river was extraordinary, considering the conveyance. At the river-side a primitive floating-bridge awaited us, on to which our steed skilfully scrambled, as did another drawing a vehicle similar to ours. The ferryman tugged us across, while his wife cleared away the numerous loose pieces of wood which, breaking away from the rafts, encumber so many of the Russian rivers.

On the farther side of the Aa forest scenery deepened; and, as we were now ascending, the pace became slower, and oft we stopped to listen to the nightingales or to take a longer look at

the romantic surroundings of the ancient castles of Segewold, Kremon, and Treyden. At Kremon there has arisen a new castle, built by Fürst Paul von Lieven. A point of interest about Kremon is that it is authentically mentioned in 1318, and as the name is of Lettish origin it is computed that the Letts invaded the land of the Livs about that time; invaded to some purpose, too, for the latter have practically been swept out of existence.

It was nine o'clock when we arrived at Treyden's well-known *Gasthaus*, the Schweizer Hof Hotel (over nine hundred feet high). Dinner was over; but a little supper, consisting of cutlets, cold meat, potatoes, beans, a delicious sweet, and tea, was soon ready. Could equivalent fare be got at a village inn in this country? Simpler, as it was, even than perhaps the Norwegian hotels, we nevertheless found here all that was necessary to civilisation. Our bedroom was clean and the beds most comfortable. On our asking for hot water at night, an enormous teapot full was brought, and it was replenished in the morning. The hotel boasted fourteen rooms, and twenty-five beds at one shilling per bed. Breakfast (delicious coffee, rolls, and butter) cost sevenpence halfpenny; dinner, one shilling for two courses (good soup, meat, and vegetables), and one shilling and fourpence for three. *Pension* for the month, three pounds sixteen shillings, or two-and-ninepence by the day. Meals were served on a large general veranda, or on one attached to your bedroom. Further advantages—cheerful attendance, a rest-cure, and no extras. Supper over, the remainder of the evening was spent in walking through the woods and sitting in a beautiful old-fashioned flower-garden, noted for centuries. It is on the estate of an eccentric old baron, and from its high situation on a plateau between two gorges running down to the Aa one gets a magnificent and characteristic view of this lovely little valley. Another picture on this estate is a very beautiful arrangement of lime-trees. They were planted in imitation of the interior of a cathedral; four rows form the nave and side-aisles, while at the east end the chancel is represented. Standing 'like Druids of old' in their height, their strength, and their ecclesiastical dignity, they are the walls and the pillars of a sanctuary where perhaps services were held long before the erection of temples made with hands. We paid more than one visit to garden and cathedral.

From Treyden, amidst romantic forest-clad hill, valley, and river scenery, there are endless walks leading to the many surrounding beauty landscape spots—to Thoreida, Gutmannshöhle, Kremon, and others; and all have their historical and other individual points of interest. The red-sandstone walls of the cave, which gives its name to Gutmannshöhle, are covered with inscriptions, names, and dates going back to the sixteenth century. Needless to say, all the

schools of Riga (and there are many) have left their mark! There is also a record of the visit of Nicholas II. in the year 1860. Wenden and Wolmar take the tourist farther north; but both, within measurable distance one of the other, are easily reached by train from Segewold, or one can drive by post-horse. Wenden, from the earliest times up to the latest, has played a most important part in the history of Livland. But for many years nothing very much more exciting has taken place than an annual agricultural exhibition—a welcome distraction in the otherwise quiet life of the pretty little town, the population of which is about six thousand five hundred. Here, too, are beautiful walks, and the locality is notoriously healthy.

It was with many regrets that we left Treyden, which we did in the early morning, starting at seven o'clock, comfortably seated on the *linientroschky*, to drive to Peterskappelle. We could have gone with post-horses along the Czar's highway; but the drive would not have been so pretty, for our driver (a Lett) took us by bypaths through fields and forests. In turn we passed fields of high-standing rye, full-headed red clover, the pretty-leaved buckwheat, flax, oats, and vegetables of all sorts. It was quite evident from the general appearance of things that agriculture was not neglected. The best-cultivated land and the tidiest-looking farms were those of the Letts, many of whom have built themselves country houses of no mean size. The Government estates were certainly not so prosperous-looking, and the farm-buildings

were sadly in need of repair. Half-way a stop was made at the village *krug* (inn) of Kolzan, now called a tea-house, because there, as at many country inns, alcohol is no longer sold. There is a big Lettish temperance movement going on in Livland, and not before it was needed. The second part of the drive was entirely through forests, along a road made by the proprietor of the estate. The perfume of the pines lingers with me now, and as we approached Peterskappelle, and passed the little church and pretty villas surrounded by them, they became more redolent. Arrived at our destination, we still seemed in the woods, for each of the isolated dwellings stood in its own little coniferous plantation. At Peterskappelle an ideal week was spent, and not a few interesting hours were passed among the Letts, attending their early morning market, their church service, and in hearing from friends of their economic progress since their emancipation.

Since the foregoing was written the enemy has made headway in Courland, and at the beginning of November Hindenburg reported an advance along the railway from Tuckum to Riga. Libau, the important Baltic port of Courland, had been in the hands of the Germans since the spring. The wife of our late Vice-Consul was practically a prisoner, and was not allowed to write to her daughters in England. The present Mayor of Libau bears the Scottish name of Melville. I knew him well when he was a student at St Petersburg; now he has a son fighting in the Russian army.

THE DAY OF WRATH.

A STORY OF 1914.

By LOUIS TRACY, Author of *The Final War*, *Rainbow Island*, *The Terms of Surrender*, &c.

CHAPTER IV.—THE TRAGEDY OF VISÉ.

EARLY as was the hour, a door leading to the dwelling-house stood open. The sound of feet on the cobbled pavement of the mill-yard brought a squat, beetle-browed old man to the threshold. He surveyed the strangers with a curiously haphazard yet piercing underlook. His black eyes held a glint of red. Here was one in a subdued torment of rage, or, it might be, of ill-controlled panic.

'What now?' he grunted, using the local argot.

Dalroy, quick to read character, decided that this crabbed old Walloon was to be won at once or not at all.

'Shall I speak French or German?' he said quietly.

The other spat. '*Qu'est-ce que tu veux que je te dise, moi?*' he demanded. Now, the plain English of that question is, 'What do you wish me to say?' But the expectoration, no less than

the biting tone, lent the words a far deeper meaning.

Dalroy was reassured. 'Are you Monsieur Henri Joos?' he said.

'Ay.'

'This lady and I have come from Aix-la-Chapelle with your man, Maertz.'

'Oh, he's alive, then?'

'I hope so. But may we not enter?'

Joos eyed the engine-cleaner's official cap and soiled clothes, and his suspicious gaze travelled to Dalroy's well-fitting and expensive boots.

'Who the deuce are you?' he snapped.

'I'll tell you if you let us come in.'

'I can't hinder you. It is an order, all doors must be left open.'

Still, he made way, though ungraciously. The refugees found themselves in a spacious kitchen, a comfortable and cleanly place, Dutch in its colourings and generally spick and span

aspect. A comely woman of middle age, and a plump, good-looking girl about as old as Irene, were seated on an oak bench beneath a window. They were clinging to each other, and had evidently listened fearfully to the brief conversation without.

The only signs of disorder in the room were supplied by a quantity of empty wine-bottles, drinking-mugs, soiled plates, and cutlery, spread on a broad table. Irene sank into one of half-a-dozen chairs which had apparently been used by the feasters.

Joos chuckled. His laugh had an ugly sound. 'Pity you weren't twenty minutes sooner,' he guffawed. 'You'd have had company, pleasant company, visitors from across the frontier.'

'I, too, have crossed the frontier,' said Irene, a wan smile lending pathos to her beauty. 'I travelled with Germans from Berlin. If I saw a German now I think I should die.'

At that Madame Joos rose. 'Calm thyself, Henri,' she said. 'These people are friends.'

'Maybe,' retorted her husband. He turned on Dalroy with surprising energy, seeing that he was some twenty years older than his wife. 'You say that you came with Maertz,' he went on. 'Where is he? He has been absent four days.'

By this time Dalroy thought he had taken the measure of his man. No matter what the outcome to himself personally, Miss Beresford must be helped. She could go no farther without food and rest. He risked everything on the spin of a coin. 'We are English,' he said, speaking very slowly and distinctly, so that each syllable should penetrate the combined brains of the Joos family. 'We were only trying to leave Germany, meaning harm to none, but were arrested as spies at Aix-la-Chapelle. We escaped by a ruse. I knocked a man silly, and took some of his clothes. Then we happened on Maertz at a corner of Franz-Strasse, and persuaded him to give us a lift. We jogged along all right until we reached the cross-roads beyond the hill there;' and he pointed in the direction of the wood. 'A German officer refused to allow us to pass, but a motor transport knocked the wagon over, and this lady and I were thrown into a field. We got away in the confusion, and made for a cowshed lying well back from the road and on the slope of the hill. At that point my friend fainted, luckily for herself, because, when I examined the shed, I found the corpse of an old woman there. She had evidently been about to milk a black-and-white cow when she was bayoneted by a German soldier'—

He was interrupted by a choking sob from Madame Joos, who leaned a hand on the table for support. In pose and features she would have served as a model for Hans Memling's 'portrait' of Saint Elizabeth, which in happier

days used to adorn the hospital at Bruges. 'The Widow Jaquinot!' she gasped.

'Of course, madame, I don't know the poor creature's name. I was wondering how to act for the best, when two soldiers came to the stable. I heard what they were saying. One of them admitted that he had stabbed the old woman; his words also implied that he and his comrade had violated her granddaughter. So I picked up a milking-stool and killed both of them. I took one of their rifles, which, with its bayonet and a number of cartridges, I hid at the top of the ravine. This is the pail which I found in the shed. No doubt it belongs to the Jaquinot household. Now, I have told you the actual truth. I ask nothing for myself. If I stay here, even though you permit it, my presence will certainly bring ruin on you. So I shall go at once. But I *do* ask you, as Christian people, to safeguard this young English lady, and, when conditions permit, and she has recovered her strength, to guide her into Holland—unless, that is, these German beasts are attacking the Dutch too.'

For a brief space there was silence. Dalroy looked fixedly at Joos, trying to read Irene Beresford's fate in those black, glowing eyes. The womenfolk were won already; but well he knew that in this Belgian nook the patriarchal principle that a man is lord and master in his own house would find unquestioned acceptance. He was aware that Irene's gaze was riveted on him in a strangely magnetic way. It was one thing that he should say calmly, 'So I picked up a milking-stool and killed both of them,' but quite another that Irene should visualise in the light of her rare intelligence the epic force of the tragedy enacted while she lay unconscious in the depths of a hedgerow. Dalroy could tell, Heaven knows how, that her very soul was peering at him. In that tense moment he knew that he was her man for ever. But—*surgit amari aliquid!* A wave of bitterness welled up from heart to brain because of the conviction that if he would, indeed, be her true knight, he must leave her within the next few seconds. Yet his resolution did not waver. Not once did his glance swerve from Joos's wizened face.

It was the miller himself who first broke the spell cast on the curiously assorted group by Dalroy's story. He stretched out a hand and took the pail. 'This is fresh milk,' he said, examining the dregs.

'Yes. I milked the cow. The poor animal was in pain, and my friend and I wanted the milk.'

'You milked the cow—before?'

'No. After.'

'*Grand Dieu!* you're English, without doubt.'

Joos turned the pail upside-down, appraising it critically. 'Yes,' he said, 'it's one of Dupont's. I remember her buying it. She gave him fifty

kilos of potatoes for it. She stuck him, he said. Half the potatoes were black. A rare hand at a bargain, the *Veuve Jaquinot*. And she's dead, you tell me. A bayonet-thrust?'

'Two.'

Madame Joos burst into hysterical sobbing. Her husband whisked round on her with that singular alertness of movement which was one of his most marked characteristics.

'Peace, wife!' he snapped. 'Isn't that what we're all coming to? What matter to Dupont now whether the potatoes were black or sound?'

Dalroy guessed that Dupont was the iron-monger of Visé. He was gaining a glimpse, too, of the indomitable soul of Belgium. Though itching for information, he checked the impulse, because time pressed horribly.

'Well,' he said, 'will you do what you can for the lady? The Germans have spared you. You have fed them. They may treat you decently. I'll make it worth while. I have plenty of money'—

Irene stood up. 'Monsieur,' she said, and her voice was sweet as the song of a robin, 'it is idle to speak of saving one without the other. Where Monsieur Dalroy goes I go. If he dies, I die.'

For the first time since entering the mill Dalroy dared to look at her. In the sharp, crisp light of advancing day her blue eyes held a tint of violet. Tear-drops glistened in the long lashes; but she smiled wistfully, as though pleading for forgiveness.

'That is sheer nonsense,' he cried in English, making a miserable failure of the anger he tried to assume. 'You ought to be reasonably safe here. By insisting on remaining with me you deliberately sacrifice both our lives. That is, I mean,' he added hastily, aware of a slip, 'you prevent me too from taking the chance of escape that offers.'

'If that were so I would not thrust myself on you,' she answered. 'But I know the Germans. I know how they mean to wage war. They make no secret of it. They intend to strike terror into every heart at the outset. They are not men, but super-brutes. You saw Von Halwig at Berlin, and again at Aix-la-Chapelle. If a titled Prussian can change his superficial manners—not his nature, which remains invariably bestial—to that extent in a day, before he has even the excuse of actual war, what will the same man become when roused to fury by resistance? But we must not talk English.' She turned to Joos. 'Tell us, then, monsieur,' she said, grave and serious as Pallas Athena questioning Perseus, 'have not the Prussians already ravaged and destroyed Visé?'

The old man's face suddenly lost its bronze, and became ivory-white. His features grew convulsed. He resembled one of those grotesque masks carved by Japanese artists to simulate a

demon. 'Curse them!' he shrilled. 'Curse them in life and in death—man, woman, and child! What has Belgium done that she should be harried by a pack of wolves? Who can say what wolves will do?'

Joos was aboil with vitriolic passion. There was no knowing how long this tirade might have gone on had not a speckled hen stalked firmly in through the open door with obvious and settled intent to breakfast on crumbs.

'*Ciel!*' cackled the orator. 'Not a fowl was fed overnight!'

In real life, as on the stage, comedy and tragedy oft go hand-in-hand. But the speckled hen deserved a good meal. Her entrance undoubtedly stemmed the floodtide of her owner's patriotic wrath, and thus enabled the five people in the kitchen to overhear a hoarse cry from the roadway: 'Hi, there, *dummer Esel!* whither goest thou? This is Joos's mill.'

'Quick, Léontine!' cried Joos. 'To the second loft with them! Sharp, now!'

In this unexpected crisis Dalroy could neither protest nor refuse to accompany the girl, who led him and Irene up a back-stair and through a well-stored granary to a ladder which communicated with a trap-door.

'I'll bring you some coffee and eggs as soon as I can,' she whispered. 'Draw up the ladder, and close the door. It's not so bad up there. There's a window, but take care you aren't seen. Maybe,' she added tremulously, 'you are safer than we now.'

Dalroy realised that it was best to obey.

'Courage, mademoiselle!' he said. 'God is still in heaven, and all will be well with the world.'

'Please, monsieur, what became of Jan Maertz?' she inquired timidly.

'I'm not quite certain, but I think he fell clear of the wagon. The Germans should not have ill-treated him. The collision was not his fault.'

The girl sobbed, and left them. Probably the gruff Walloon was her lover.

Irene climbed first. Dalroy followed, raised the ladder noiselessly, and lowered the trap. His brow was seamed with foreboding, as, despite his desire to leave his companion in the care of the miller's household, he had an instinctive feeling that he was acting unwisely. Moreover, like every free man, he preferred to seek the open when in peril. Now he felt himself caged.

Therefore was he amazed when Irene laughed softly. 'How readily you translate Browning into French!' she said.

He gazed at her in wonderment. Less than an hour ago she had fainted under the stress of hunger and dread, yet here was she talking as though they had met in the breakfast-room of an English country house. He would have said something, but the ancient mill trembled under the sudden crash of artillery. The roof creaked,

the panes of glass in the dormer window rattled, and fragments of mortar fell from the walls. Unmindful, for the moment, of Léontine Joos's warning, Dalroy went to the window, which commanded a fine view of the town, river, and opposite heights.

The pontoon bridge was broken. Several pontoons were in splinters. The others were swinging with the current toward each bank. Six Belgian field-pieces had undone the night's labour, and a lively rat-tat of rifles, mixed with the stutter of machine-guns, proved that the defenders were busy among the Germans trapped on the north bank. The heavier ordnance brought to the front by the enemy soon took up the challenge; troops occupying the town, which, for the most part, lies on the south bank, began to cover the efforts of the Engineers, instantly renewed. History was being written in blood that morning on both sides of the Meuse. The splendid defence offered by a small Belgian force was thwarting the advance of the 9th German Army Corps. Similarly, the 10th and 7th were being held up at Verviers and on the direct road from Aix to Liège respectively. All this meant that General Leman, the heroic Commander-in-Chief at Liège, was given most precious time to garrison that strong fortress, construct wire entanglements, lay mines, and destroy roads and railways; which, again, meant that Von Emmich's sledge-hammer blows with three army corps failed to overwhelm Liège in accordance with the dastardly plan drawn up by the German staff.

Dalroy, though he might not realise the marvellous fact then, was in truth a spectator of a serious German defeat. Even in the conditions, he was aglow with admiration for the pluck of the Belgians in standing up so valiantly against the merciless might of Germany. The window was dust-laden as the outcome of earlier gun-fire, and he was actually on the point of opening it, when Irene stopped him.

'Those men below may catch sight of you,' she said.

He stepped back hurriedly. Two forage-carts had been brought into the yard, and preparations were being made to load them with oats and hay. A truculent-looking sergeant actually lifted his eyes to that particular window. But he could not see through the dimmed panes, and was only estimating the mill's probable contents.

Dalroy laughed constrainedly. 'You are the better soldier of the two,' he said. 'I nearly blundered. Still, I wish the window was open. I want to size up the chances of the Belgians. Those are bigger guns which are answering, and a duel between big guns and little ones can have only one result.'

Seemingly the German battery of quick-firers had located its opponents, because the din now became terrific. As though in response to Dalroy's desire, three panes of glass fell out owing

to atmospheric concussion, and the watchers in the loft could follow with ease the central phase of the struggle. The noise of the battle was redoubled by the accident to the window, and the air-splitting snarl of the high-explosive shells fired by the 5·9's in the effort to destroy the Belgian guns was specially deafening. That sound, more than any other, seemed to affect Irene's nerves. Involuntarily she clung to Dalroy's arm, and he, with no other intent than to reassure her, drew her trembling form close.

It was evident that the assailants were suffering heavy losses. Scores of men fell every few minutes among the bridge-builders, while casualties were frequent among the troops lining the quays. Events on the Belgian side of the river were not so marked; but even Irene could make out the precise moment when the defenders' fire slackened, and the line of pontoons began to reach out again toward the farther shore.

'Are the poor Belgians beaten, then?' she asked, with a tender sympathy which showed how lightly she estimated her own troubles in comparison with the agony of a whole nation.

'I think not,' said Dalroy. 'I imagine they have changed the position of some, at least, of their guns, and will knock that bridge to smithereens again just as soon as it nears completion.'

The forage-carts rumbled out of the yard. Dalroy noticed that the soldiers wore linen covers over the somewhat showy *Pickel-hauben*, though the regiments he had seen in Aix-la-Chapelle swaggered through the streets in their ordinary helmets. This was another instance of German thoroughness. The invisibility of the gray-green uniform was not so patent when the *Pickel-haube* lent its glint, but no sooner had the troops crossed the frontier than the linen cover was adjusted, and the masses of men became almost merged in the browns and greens of the landscape.

The two were so absorbed in the drama being fought out before their eyes that they were quite startled by a series of knocks on the boarded floor. Dalroy crept to the trap-door and listened. Then, during an interval between the salvoes of artillery, he heard Léontine's voice, 'Monsieur! Mademoiselle!'

He pulled up the trap. Beneath stood Léontine, with a long pole in her hands. Beside her, on the floor, was a laden tray.

'I've brought you something to eat,' she said. 'Father thinks you had better remain there at present. The Germans say they will soon cross the river, as they intend taking Liège to-night.'

Not until they had eaten some excellent rolls and butter, with boiled eggs, and drunk two cups of hot coffee, did they realise how ravenously hungry they were. Then Dalroy persuaded Irene to lie down on a pile of sacks, and, amid all the racket of a fierce engagement, she slept the sleep of sheer exhaustion. Thus he was left on guard,

as it were, and saw the pontoons once more demolished.

After that he, too, curled up against the wall and slept. The sound of rifle-shots close at hand awoke him. His first care was for the girl, but she lay motionless. Then he looked out. There was renewed excitement in the main road, but only a few feet of it was visible from the attic. A number of women and children ran past, all screaming, and evidently in a state of terror. Several houses in the town were on fire, and the smoke hung over the river in such clouds as to obscure the north bank.

Old Henri Joos came hurriedly into the yard. He was gesticulating wildly, and Dalroy heard a door bang as he vanished. Refusing to be penned up any longer without news of what was happening, Dalroy lowered the ladder, and, after ascertaining that Irene was still asleep, descended. He made his way to the kitchen, pausing only to find out whether or not it held any German soldiers.

Joos's shrill voice, raised in malediction of all Prussians, soon decided that fact. He spoke in the local *patois*, but straightway branched off into French interlarded with German when Dalroy appeared.

'Those hogs!' he almost screamed. 'Those swine-dogs! They can't beat our brave boys of the 3rd Regiment, so what do you think they're doing now? Murdering men, women, and children out of mere spite. The devils from hell pretended that the townsfolk were shooting at them; so they began to stab, and shoot, and burn in all directions. The officers are worse than the men. Three came here in an automobile, and marked on the gate that the mill was not to be burnt—they want my grain, you see; and as they were driving off again young Jan Smit ran by. Poor lad, he was breathless with fear. They asked him if he had seen another car like theirs, but he could only stutter. One of them laughed, and said, "I'll work a miracle, and cure him." Then he whipped out a revolver and shot the boy dead. Some soldiers with badges on their arms saw this. One of them yelled, "*Man hat geschossen!*" ("The people have been shooting!"), though it was their own officer who fired, and he and the others threw little bombs into the nearest cottages, and squirted petrol in through the windows. Madame Didier, who has been bedridden for years, was burnt alive in that way. They have a regular corps of men for the job. Then, "to punish the town," as they said, they took twenty of our chief citizens, lined them up in the market-place, and fired volleys at them. There was Dupont, and the Abbé Courvoisier, and Monsieur Philippe the notary, and—ah, *mon Dieu!* I don't know—all my old friends. The Prussian beasts will come here soon.—Wife! Léontine! how can I save you? They are devils—devils, I tell you—devils mad with drink and anger. A few scratches in

chalk on our gate won't hold them back. They may be here any moment. You, mademoiselle, had better go with Léontine here and drown yourselves in the mill-dam. Heaven help me, that is the only advice a father can give!'

Dalroy turned. Irene stood close behind. She knew when he left the garret, and had followed swiftly. She confessed afterwards that she thought he meant to carry out his self-denying project, and leave her.

'You are mistaken, Monsieur Joos,' she said now, speaking with an aristocratic calm which had an immediate effect on the miller and his distraught womenfolk. 'You do not know the German soldier. He is a machine that obeys orders. He will kill, or not kill, exactly as he is bidden. If your house has been excepted it is absolutely safe.'

She was right. The mill was one of the places in Visé spared by German malice that day. A well-defined section of the little town was given up to murder, and loot, and fire, and rapine. Scenes were enacted which are indescribable. A brutal soldiery glutted its worst passions on an unarmed and defenceless population. The hour was near when some hysterical folk would tell of the apparition of angels at Mons; but old Henri Joos was unquestionably right when he spoke of the presence of devils in Visé.

The miller's volcanic outburst seemed to have exhausted itself; he subsided to the oaken bench, leaned forward, elbows on knees, and thrust his clenched fists against his ears as though he would shut out the deafening clamour of the guns. This attitude of dejection evidently alarmed Madame Joos. She forgot her own fears in solicitude for her husband. Bending over him, she patted his shoulder with a maternal hand, since every woman is at heart a mother—a mother first and essentially.

'Maybe the lady is right, Henri,' she said tenderly. 'Young as she is, she may understand these things better than countryfolk like us.'

'Ah, Lise!' he moaned, 'you would have dropped dead had you seen poor Dupont. He wriggled for a long minute after he fell. And the Abbé, with his white hair! Some animal of a Prussian fired at his face.'

'Don't talk about it,' urged his wife. 'It is bad for you to get so excited. Remember, the doctor warned you'—

'The doctor! Dr Lafarge! A soldier hammered on the surgery door with the butt of his rifle, and, when the doctor came out, twirled the rifle and stabbed him right through the body. I saw it. It was like a conjuring trick. I was giving an officer some figures about the contents of the mill. The doctor screamed, and clutched at the bayonet with both hands. And who do you think the murderer was?'

Madame Joos's healthy red cheeks had turned

a ghastly yellow, but she contrived to stammer, 'Dieu! The poor doctor! But how should I know?'

'The barber, Karl Schwartz.'

'Karl a soldier!'

'More, a sergeant. He lived and worked among us ten years—a spy. It was the doctor who got him fined for beating his wife. No wonder Monsieur Lafarge used to say there were too many Germans in Belgium. The officer I was talking to watched the whole thing. He

was a fat man, and wore spectacles for writing. He lifted them, and screwed up his eyes, so, like a pig, to read the letters on the brass door-plate. "*Almachtig!*" he said, grinning; "a successful operation on a doctor by a patient." I saw red. I felt in my pocket for a knife. I meant to rip open his paunch. Then one of our shells burst near us, and he scuttled. The wind of the explosion knocked me over, so I came home.'

(Continued on page 85.)

SOME IRISH SUPERSTITIONS.

By REGINALD B. SPAN.

THE Irish are pre-eminently superstitious. The old legends and beliefs whose origins are lost in the mists of antiquity still cling to the Irish people, and obtain credence even in this matter-of-fact age. The fairies still dance (for the Irish) on moonlight nights, as they did in the days of yore; though to-day, with the advance of civilisation, they are constantly retreating into the wilderness and making new haunts. The banshee still wails before the death of the scion of 'good old Irish families,' undeterred by the fact that it is the twentieth century, the age of wonderful material progress and mechanical achievement.

Other death-warnings attached to ancient families still survive, of which the most remarkable is that of the Gormanstown foxes. The crest of that noble family is a running fox, while the same animal also forms one of the supporters of the coat of arms. The story is that when the head of the house is dying, the foxes—not spectral foxes, but creatures of flesh and blood—leave the coverts and congregate at Gormanstown Castle. This strange death-warning has been in the family for centuries, and its cause and origin are unknown, but probably there is some weird legend connected with it.

It will only be necessary to relate what occurred at the death of the last three viscounts to show that there is good evidence for the general belief in the story. When Jenico, the twelfth Viscount Gormanstown, was dying, in the year 1860, a large number of foxes were noticed about the country-side several days before his death, and appeared to be proceeding toward Gormanstown Castle. The day before his death foxes were seen in the gardens and close round the house; and on the day of his death they had become so bold as to advance on to the terrace beneath the dying viscount's windows. Three foxes were first noticed gambolling about and making a curious noise close to the house and just in front of the old yew-tree avenue known as The Cloisters. The Hon. Mrs Farrell, who witnessed the extraordinary spectacle, stated that the foxes came down the yew-tree avenue,

and took up a position beneath the windows where they instinctively knew that death was taking place, and then commenced to howl and make weird noises at intervals all night. The next morning they were seen crouching in stealthy fashion in the grass and bushes in front of and around the house. They passed through the poultry and never attempted to touch them; nor did they do damage of any kind. After the funeral they entirely disappeared.

Edward, the thirteenth viscount, died in 1876. On the morning of the day of his death he was feeling better than he had done for some time; but the fateful warning was there all the same, as foxes were seen in the garden, and several came and barked beneath the windows of the room where Lord Gormanstown was sitting. That evening, contrary to expectations, he had a sudden relapse, became seriously ill, and died.

The fourteenth Lord Gormanstown was not at the castle at the time of his decease, but passed away in Dublin on 28th October 1907. The foxes, however, turned up at the castle just the same, though not so soon as they generally did. About eight o'clock that night the coachman and gardener saw two foxes near the private chapel of the castle (where the body would eventually be brought from Dublin before interment), and six more round the front of the house, and several whining and 'crying' in the yew-tree grove. After Lord Gormanstown's body had been brought to the castle for burial, the Hon. Richard Preston was in the chapel watching beside it, and about 3 A.M. he heard a curious 'shuffling' noise, then a sound as if a number of people were walking stealthily about with bare feet on the gravel outside. He opened the side-door of the chapel and listened, and heard a continuous sniffing and whimpering, and some scratching at the big entrance-door. On opening it he found a large fox sitting on the path within a yard of him. Just in the shadow was another, while several could be heard moving about in the darkness beyond. He then went to the end door opposite the

altar, and saw two more foxes, one so close that he could have touched it. The noise continued all night till 5 A.M., when it ceased suddenly.

In County Limerick there is a well-known death-warning which occurs in the Scanlan family, and takes the form of flames of fire outside the house, and bright lights inside, and is known as the Scanlan Lights. The Scanlans of Ballyknockane, in Limerick, are a very ancient family, descended from the kings of Ossory, and it is in connection with one of these Irish kings—Scanlan Mor, who died A.D. 640—that the death-warning takes its origin (or such is the tradition). Briefly, the legend is as follows. Scanlan Mor was cast into prison by the Ard-Righ of Ireland, and loaded with fetters. When St Colum-cille, who was attending the Synod of Drom Cead, heard of it, he begged that he should be liberated, but the Ard-Righ roughly refused. St Colum-cille therefore declared that, in spite of all opposition, the king should be set free, and that very night, too. Colum-cille then departed; and at midnight a pillar of fire appeared over Scanlan Mor's prison, and the bright light, flashing into the room where he lay asleep, awoke him. Then a voice bade him rise and shake off his fetters, which, in amazement, he did, and he was conducted out past the affrighted guards by an angel in shining white robes. He was met by St Colum-cille, who afforded him his protection ever after. Such is the traditional origin of the Scanlan Lights; though Canon Carrigan, in his *History of the Diocese of Ossory*, shows that this legend should rather be connected with Scanlan, son of Ceannfaeladh.

These lights appear before the death of any member of the Scanlans of Ballyknockane. The present head of the family saw the lights first as a pillar of fire with a radiated top outside the house, and then inside the house by one of the rooms being brilliantly lighted at midnight when no one was in it. Four persons in County Limerick have seen the lights on Knockfierna, near Ballyknockane, before the death of a Scanlan, one of the four being William Scanlan, J.P., who a few years ago saw the flames on the hillside just before his aunt died. In 1913 the lights appeared on the eve of the death of a relation of the present owner of Ballyknockane.

The most famous banshee of olden times was that attached to the kingly family of O'Brien, generally known as Aibhill, which haunted the rock of Craglea, above Killaloe. Before the battle of Clontarf (A.D. 1014), Aibhill appeared to the warrior king Brian Boru, and warned him of his death, which occurred twelve hours later. In olden times the banshee was always seen, but nowadays it is always heard, though very rarely seen. It generally manifests its presence by a wailing noise. The following is a typical instance of the quite modern banshee.

In March 1900 an Irish lady, a Mrs P., was

very ill, and was attended by one of her daughters and a nurse. One evening, as they were arranging the invalid's bed, an extraordinary wailing noise commenced quite close to them, and seemed to come first from over the bed and then from under it, and to proceed round the room. They searched everywhere, but could find nothing to account for the wailing. Another daughter, who was downstairs, heard the noise, and thought at first it was her little boy, who was in bed upstairs, crying and shrieking, and that something terrible must have happened to him; but on going to his room she found him asleep. The people in the house adjoining heard it, and came to inquire what had happened. When they found that the noise was unaccounted for, one of them exclaimed, 'It's the banshee! Mrs P. must be dying.' So it proved to be, as the old lady died soon after.

In connection with the banshee a curious incident occurred in a public school a few years ago. One of the boys, being ill, occupied a room by himself, and had medical attendance. One morning, when the doctor called to see him, he suddenly exclaimed that he could hear some one crying and wailing in the room, and making a horrible noise. The doctor could hear nothing, and concluded that the illness had slightly affected the boy's brain. However, the boy persisted that he could hear some one wailing, and then added, 'I know what it is. It's the banshee. I've heard it before.' The next day the headmaster received a telegram saying that the boy's brother had been accidentally shot dead.

The following legend (which is related by Lord Walter Fitzgerald) is one of that kind which have no evidence of value in support of the facts, but it has been handed down from generation to generation in the Fitzgerald family, and should deserve our respect if only for its antiquity. When Garrett Oge (Gerald the Younger), the eleventh Earl of Kildare, died in London, on 16th November 1585, his body was brought back to Ireland and buried in St Brigid's Cathedral in Kildare. He was known as the Wizard Earl, on account of his practising the black art, whereby he was enabled to transform himself into bird or animal, according to his choice; and so notorious was his power that he became the terror of the country-side. His wife, the countess, had long wished to see some proof of his skill, but he had always refused to gratify her curiosity, as he said that if he did, and she became afraid, he would be taken from her, and she would never see him again. Still she persisted, and at last he said he would grant her request on condition that she first underwent three trials to test her courage. In the first trial the river Greese, which flows past the castle walls, overflowed its banks at a sign from the earl, and flooded the great hall in which they were sitting. The countess showed no sign of fear, so at the earl's command the waters re-

turned to their natural course. In the second trial a great serpent-like monster entered by one of the windows, and, after crawling about amongst the furniture, finally coiled itself around the countess; but still she showed no fear, and at a word from the earl the creature left her and vanished. In the third trial an intimate friend of the countess, who had died some time before, entered the room, and passing slowly by her, went out at the other end; but this did not frighten the countess in the least, so the earl felt he could safely turn himself into another shape in her presence. He then transformed himself into a black-bird, and flew about; but a black cat appeared from under a chest and sprang at the bird, and this so terrified the countess that she screamed and fainted. When she recovered she was alone, the bird and cat had disappeared, and she never saw the earl again. It is said that he and his knights lie in an enchanted sleep, with their horses beside them, in a cave under the Rath on the Hill of Mullaghmast, which stands five miles north of Kilkea Castle. Once in seven years they are allowed to come forth, when they gallop round the Curragh, thence across country to Kilkea Castle, where they re-enter the haunted wing, and then return to the Rath of Mullaghmast.

In connection with this legend there are several stories extant, one of which is as follows. Shortly before '98 a blacksmith was crossing the Curragh in a donkey-cart from Athgarvan to Kildare, and when in a wild, lonely part he heard horses galloping up behind him. Pulling to one side of the road, he looked back, and was terrified at seeing a troop of knights, fully armed, led by one on a white horse. The leader halted his men, and, riding up to the blacksmith, asked him to examine the shoes of his horse. Almost helpless from fear, he stumbled out of his cart and looked at each shoe, which was of silver, and then informed the knight that all the nails were sound. The knight thanked him, rejoined his troop, and they galloped off. On reaching Kildare the man entered a public-house, ordered a noggin of whisky, drank it neat, and then, feeling more himself again, he related to those present what had befallen him on the Curragh. One old man, who knew the folklore of the country intimately, exclaimed, 'By the mortal, man, ye are afther seein' Gerod Earla!' This fully explained the mystery. Gerod Earla, or Earl Gerald, is the name by which the Wizard Earl is known to the peasantry.

Phantom coaches are numerous in Ireland. Here is an account of one seen by a clergyman, a gold medallist of Trinity College, Dublin, and known throughout the whole of the north of Ireland as a most level-headed man. This gentleman occupied an old rectory a few miles from a manufacturing town in County Down. From the main road to the house there was a private avenue, which ended in a gravel sweep in front

of the hall door. One winter evening, when he was returning from a sick call, a carriage going at a sharp pace passed him in the avenue. He hurried on, thinking it was some particular friends coming to see him; but when he reached the door no carriage was to be seen, so he concluded it must have gone round to the stables. The servant who answered his ring said that no visitors had called, and on making inquiries at the stables he learnt that no vehicle of any kind had been there. Those of the household who were sitting in the drawing-room had also heard the carriage draw up. The clergyman was positive he had seen a closed carriage with lamps lit. On another occasion a servant, coming back late from a visit to her home, met the phantom carriage driving down the avenue, but had no idea that it was not a real vehicle. She happened to mention to the cook that she was nearly run over by a carriage in the avenue, and asked who the visitors were. As a matter of fact, no vehicle of any kind had been in the avenue that evening, or anywhere near the house. The occupants of the rectory heard the phantom coach many times, but only twice was it seen.

Another instance of a similar phenomenon is related by Mr Mathias Fitzgerald, Cappagh House, County Limerick. One moonlight night he was driving along the road from Askeaton to Limerick, when he heard coming up behind him the roll of wheels, the clatter of horses' hoofs, and the jingling of bits. He drew over to his own side to let the carriage pass, but nothing came by. He looked back, but could see nothing; the road was bare and empty, though the sounds were still quite audible. This continued for about twenty minutes, until he came to a cross-road, down which he had to turn. As he turned off he heard the invisible carriage dash past rapidly along the straight road. He found out later that other persons had had a similar experience.

Phantom dogs play a large part in Irish superstitions. As an instance, there are the Spectral Hounds of Doneraile, in County Cork, which have been seen and heard by several reputable witnesses. The writer met a Mr Hornibrook at Limerick, who had both seen and heard these hounds in Doneraile Park when he was park-keeper to Lord Doneraile. His son was with him at the time, and witnessed the same extraordinary spectacle. It was a bright moonlight night, and they were crossing the park after seeing that all the gates were closed, when suddenly they heard the baying of a pack of hounds in full cry coming rapidly towards them. They stepped into the shadow of some trees and waited to see what extraordinary thing was happening, as they knew it was impossible that any hounds could be in the park, enclosed as it was by high walls and locked gates. Round a bend of the plantation came a pack of foxhounds, followed by a solitary horseman on a big black horse.

They passed so close that the Hornibrooks could hear the panting of the hounds, and then, sweeping across the greensward at a tremendous rate, they were lost to view. The horseman was stated to be the third Viscount Doneraile. The legend is well known in the country around, and the present Lord Doneraile is fully aware of it. A brief account of this phenomenon appeared in the *Occult Review* some years ago, with a letter from Lord Doneraile regarding it.

Professor Barrett, F.R.S., personally investigated some of the weird occurrences in Ireland, and in a paper read by him before the Society for Psychical Research (*Proceedings*, August 1911),

gave the result of his inquiries, and stated that there was very little room to doubt the genuineness of the phenomena he had seen and carefully investigated. One of the conclusions he drew from his study of the subject was that 'the widespread belief of the Irish in fairies, pixies, gnomes, brownies, &c. probably rests on the varied manifestations of *poltergeists*.' A *poltergeist* is an unseen entity which manifests its presence by making unaccountable noises, moving things about, and playing pranks on human beings; such manifestations are very common in Ireland, and at the root of many of their superstitions.

TRANSMISSION OF CODE MESSAGES.

WHAT the diplomat calls 'notes' are the official messages exchanged between ambassadors, consuls, and the Government. During the present European war the amount of this correspondence has been much greater than before. The notes from the United States to its representatives in Germany and other European countries are, of course, in a cipher known only to the officials who send and receive them. Even the cable operator who transmits them knows nothing of their contents. The code message is composed of ordinary words, used apparently in a meaningless way. Each word represents a phrase or sentence. Thus 'Peni-stone' in one code means 'Can't make an offer.'

Every Government has a special cipher compiled by its experts. The cipher is, however, a somewhat defective method of securing secrecy, as it is almost impossible to baffle the cipher unraveller. During the Spanish-American war the Spaniards were surprised at the seeming laxity of the Americans in allowing a certain cable to be used by them; and they poured through cipher messages which were duly received and acknowledged by their agents. The senders and recipients little dreamed that every message which was sent by that cable passed first through the hands of the Americans, and was read by them. To the surprise of the Spaniards, the supposed secret messages led to operations that disastrously foiled some of their movements.

How the notes are enciphered, coded, guarded against errors, cabled, deciphered, and yet their secrecy preserved is one of the features of interest concerning these international communications. While important papers come through the American State Department, and always bear the signature of the Secretary of State, it is generally known that President Wilson composes some of the more important notes, which are then considered by the Cabinet, and later by the legal staff.

Before an important note is placed on the wire

it is generally the custom to check the accuracy of the cipher by deciphering it and comparing the result with the original. When a note of this kind is transmitted, only those having access to the code-book, or a clever cipher unraveller, would be able to understand a word of it.

The code-book is the cipher dictionary. The books from which the symbols are taken—the latter represented by figures and letters, and sometimes by groups of both, with spaces—are kept in lockfast safes when not in use, and none but trusted persons employed in this particular branch of the American State Department work have access to them. The code-books of the State Department are guarded with the same vigilance as the code of the navy.

An account of the method by which President Wilson's notes were despatched to the German Foreign Minister recently appeared in the *Telegraph and Telephone Age*. After the Secretary of State had affixed his signature, he handed it to the chief clerk of the State Department, who had the pages of the notes, consisting of approximately fifteen hundred words, distributed among the cipher clerks, and the work of enciphering began. Before important notes are placed on the wire, it is, as already mentioned, the custom generally to prove the accuracy of the coding by deciphering and comparing the result with the original. The *Lusitania* note was tested in this way, and did not leave the hands of the chief cipher clerk until he had satisfied himself that when decoded by the Ambassador in Berlin it would be identical, word for word, with the note as the President wrote it. The first page was coded at 2 P.M., and an operator began to telegraph it from the State Department to the Commercial Cable Company's office at New York. At this stage the message was in the form of a stream of dots and dashes, which the operator in the cable office retranslated into the same coded form in which it existed at Washington. As the sheets were

written up by this man they were handed to the cable operator, who proceeded to transmit it over the submarine cable in another disguise. The same system of Morse code employed on land lines is not used for submarine cabling, and another system, known as the Continental cable code, is used. Messages, instead of being hand-keyed, are sent by an automatic transmitter. The nearest example to the operation of this machine is an automatic piano-player. As in the latter the musical composition is disguised in a maze of perforations in a paper roll, so in the cable transmitter the message exists in the form of a procession of small round holes in a continuous strip of paper. Simultaneously with the clicking of the automatic transmitter in the office of the cable company, the signals are received on a recorder at the distant end on a paper tape which runs through the recorder, and a delicate glass siphon draws a fine ink-line on it. When no signals are passing, this line lies in the middle of the slip perfectly straight. When a 'dot' arrives the siphon draws a little hump above the line, while if a 'dash' is sent the hump is below. Thus the signals in a message are represented by a continuous line full of hills and valleys. Hopelessly unmeaning as this line may appear to the uninitiated, the expert operator is able to read it as quickly and with as much certainty as if it were ordinary print. The expert receiving operator translates this as fast as the siphon traces out the mysterious symbols, and if one were to compare the copy he makes it would be found identical with the coded message which a few minutes ago was being keyed on from Washington to New York.

Once more it is despatched over other wires, until finally it is typed out for the last time in its coded form; and then comes the very difficult and lengthy process of decoding, performed with the help of the key in the hands of the Ambassador at Berlin.

At the outbreak of the war Germany had eleven submarine cables. Five of these—the most important of all—landed at Borkum. Two of the cables ran to the Azores, and placed Germany in communication with the United States. One went to Brest, another to Vigo, and another to Teneriffe. As all these cables passed through the English Channel, they were promptly cut. Between England and Germany there were seven cables, and communication by these at once passed under British control. Looking out for an outlet on the north, Germany might seek to send and receive messages through Denmark, Norway, Sweden, and Holland; but such messages would reach Britain or France, and so fall under the eye of vigilant censors. In the south Germany was equally unfortunate. The cables laid east and west in the Mediterranean are the property of the Eastern Telegraph Company, a British concern, and land on British soil. Should Germany wish to tele-

graph to Africa she would find herself in the same dilemma—the certainty of her telegrams passing through British hands. She would be no better off if she tried to telegraph to India or China overland, as there are no lines she could use except such as are controlled by the Allies.

Perhaps nothing has contributed more to the commercial supremacy of Britain than her enterprise with regard to the submarine cable. During the last sixty years Britain has excelled all other countries in her quick communication with the remote parts of the world. Europe received its news through London. When at last other countries sought to free themselves from this monopoly they had to seek British aid. When France and Germany desired to possess cables of their own to America, they had to get Britain to manufacture and lay the cables for them. In late years factories for the making of cables have been established by Germany at Ordenham, by France at Calais, and by Italy at Spezia. The foreign manufactories were started with Government subsidies, and the awakening of Governments to the value of cables has been remarkable. Until a few years ago the submarine telegraphs were all in private hands, the capital being wholly subscribed by the public. There are at present no fewer than two thousand nine hundred and thirty-seven cables, and of the various Governments the British hold the largest number.

Of the messages sent by the submarine cables, 90 per cent. are on business. It is estimated that the British spend about three thousand five hundred pounds a day on telegrams to the United States, one thousand pounds a day on cables to Australia, and another one thousand pounds a day on cables to India, South Africa, China, and the East.

The rate for ordinary telegrams to New York is one shilling per word, but the price to some of the states is considerably higher. The cheapest ordinary message to Canada costs the same per word as to New York.

WHEN I SHALL ASK.

I WILL not ask you for your love
 When other suitors seek it too,
 When half the world shall stand in awe,
 And hunger for a word from you;
 Nor will I ask for it when fame
 Has scattered gold about your way,
 And life is like a summer's day—
 I will not ask you then.

But when you find that age has stolen
 The golden gleams from out your hair,
 And youth has vanished from your face,
 And beauty reigns no longer there;
 And all the friends you once thought true,
 Or cold or false and faithless seem,
 And fame has proved an empty dream—
 I'll ask you then!

KATHARINE COX.

Chambers's Journal

SEVENTH SERIES

WAR TO-DAY.

By Sir J. H. A. MACDONALD, K.C.B., LL.D., Author of *Life Jottings of an Old Edinburgh Citizen*.

IT was a common and confident prediction, when rifled firearms great and small had asserted their ascendancy over the brass smooth-bore and the Brown Bess, that in the future there would be no protracted wars; that destruction would be so rapid and overwhelming as to cause one combatant or the other to offer terms of peace. This has proved itself to be a short-sighted view. Even the Franco-Prussian war in no way tended to support the prophecy. It is true that it was comparatively short, but that was the result of the Teutonic forces being well equipped and well trained, and of the French being in a state of unpreparedness, losing from this cause a whole army within a few weeks of the commencement of hostilities, and being unable to keep back the enemy from their capital or relieve it when besieged. But that campaign lent no support to the theory that a war between forces both well equipped, well trained, and well handled would necessarily have the adjectives 'short, sharp, and decisive' justly applied to it.

Since the war of 1870 the progress in invention of both artillery and small-arms has been phenomenal. While in the past the guns used in the field ranged from two to three miles, ten miles is by no means the limit of their effectiveness now; and while in the case of small-arms a range of a thousand yards was considered a maximum even with match-rifles, to-day the military weapon is efficient up to two thousand five hundred yards; and, in addition to this, the rapidity of fire has increased enormously, particularly in the case of small-arms, by the aid of detachable magazines, and most of all by the perfection of the machine-gun, which from an ordinary rifle-barrel can project hundreds of shots per minute. Therefore, if there was any plausibility in the prediction that efficiency of weapons would shorten the duration of wars, it should show itself now; but it has not done so. Eighteen months have passed, during which fierce combat has raged over a front of practically a thousand miles; and so far is peace out of contemplation that even military prophecy speaks of what is to be accomplished 'next spring.' And even then there is no safe prediction of the end.

There are two most remarkable features of
No. 267.—VOL. VI.

the present war. The one is that the change in weapons has driven the combatants back to many features of the campaigns of the past; and the other is that a new force has for the first time shown its efficiency both for combatant and non-combatant services in war, on land as well as on sea, and, most remarkable of all, both above the land and under the sea.

As regards the first, no one change is more remarkable than the reversion to the use of the howitzer, by which heavy and ponderous shot are fired upwards at a low velocity, to fall with smashing effect—a weapon which was much used in former sieges, in the days before the introduction of rifled guns. The use of these howitzers—the descendants of the old siege mortars—has most telling effect in this day, when every battle is a succession of fortified trenches.

Another most remarkable change is that the advance over open plains to attack is practically no longer possible, and the battlefield of to-day is in character a scene of sieges, the attackers working toward the enemy's position by trenching, with the old zigzag and sap, and mining to get up to the enemy's defending trenches. So much is this the case that the language of the fight speaks no more in the old phrases, the expressions always being when men go forward that they are going 'to the trenches,' and when they are relieved for rest that they are being brought back 'from the trenches.' There is practically no open manœuvring at all. The first thing is to be well dug in, and from your trench to rush a short distance and fight your enemy in his trench, if he will stay to meet you. Till that moment of decision primitive devices are employed: snipers take the place of the sharpshooters with bow and arrow of Crécy and Agincourt, barbed wire takes the place of the stakes against which the French threw themselves in vain, one of their historians declaring, in speaking of the English soldiers, how their troops *vinssent se briser contre leur sang-froid et leurs palisades*. Further, the hand-grenades, from which our Grenadiers take their name and their insignia, are now being thrown in the form of bombs from trench to trench, and in throwing them it is not uncommon to use a horizontal bow, like the ballista or catapult,

[All Rights Reserved.]

JANUARY 8, 1916.

such as the Romans used to project stones at the enemy. It is also part of the training of the troops to practise throwing uncharged bombs at marks, as the soldiers of old received instruction in slinging stones. Again, there is a recurrence to armour, the French providing their soldiers with steel helmets to protect them from fragments of shell, and to give chance of bullets glancing off the rounded surface. It is even being seriously contemplated to provide front-pieces to give some protection to the vital parts of the body.

As regards fire, the volley is no longer heard in ordinary circumstances. Beyond sharp-shooting there is little firing from small-arms, except when the enemy endeavours to rush a trench, when the magazine rifle and the Maxim mow the attackers down. The bayonet has once more asserted itself as the arm of decision. The fight is decided, where those attacked hold fast, by the cold steel in hand-fighting in the trench. Indeed, of late it has been found that the bayonet when attached to the rifle puts the soldier at a disadvantage, and when he jumps into a narrow trench he must rely on shortening his butt or using his fists. This has led to the revival of the use of the ancient weapon, the dirk or the knife. It is probable that in the near future a knife like a skean-dhu, handily placed—say in a sheath fastened to his coat at the left side below the shoulder—will be a regular part of the soldier's equipment.

And if it is permissible to suggest a mode of using the knife in a trench, the writer would say: Do not aim at the body; aim at the face, by doing which you will probably disable without killing, which the good soldier does by preference, and you will flabbergast your opponent more than by striking elsewhere. A job in the face delivered back-handed is the most disconcerting mode of attack at close quarters.

One more revival of an ancient mode of attack in an improved form has been developed during the present war. The Romans were wont to use a formation called the *testudo*, in which, by covering themselves with their great shields, placed close together, both in front, on the side, and above, they were able to advance without suffering from the enemy's arrows or spears on their way to the point of decision. To-day the *testudo* is again in use in the form of an armoured carriage, mechanically driven, in which a Maxim-gun and several rifles are protected, and which can assist the troops by its fire, being able to advance and engage the enemy or to attack a convoy. This is a device which has proved most efficient. It has the special advantage that it can cover an advance or a retirement, and in the latter case can hold on to the last moment, covering the general retreat with its fire.

The second remarkable feature of the present conflict is an entire novelty, and one which has revolutionised much in the conduct of war both

in the army and the navy. Things formerly not dreamt of as possible are now daily accomplished with important effect. And this not by any discovery having a direct military bearing. It is all the result of a very simple invention, which, now that it is in daily use, leads to surprise that it was not thought of before. Not very long after the Franco-Prussian war, Gottlieb Daimler of Cannstatt conceived an idea which was, in its practical application, to revolutionise road locomotion. The gas-engine, which was an invention of the middle of last century, consists in the use of the explosion of mixed air and coal-gas—which previously had been only destructive—to drive machinery, by confining the mixture and exploding it in small quantities, causing the movement of a piston by which the power can be conveyed to machinery to do useful work. Daimler succeeded in producing an engine in which the gas to be used was made by evaporating a liquid (such as petrol) as it was required for each separate explosion, and thus making it possible to carry in a liquid form what was to be used for the explosions by which the engine was driven. In this simple manner the problem of applying the gas-engine to locomotive work was solved, and in less than a generation animal traction for fast-moving vehicles has been practically superseded. It quickly became apparent how valuable this invention would be for war purposes. To-day the power-vehicle is in universal use in non-combatant services—transport, ambulance, &c. Also, it has enormous value for the conveyance of troops. When General Joffre saw the time had come to turn from retreat to advance, he commandeered all the taxi-cabs in Paris in one night, and in the early morning they were conveying to the front reinforcements from the garrison of Paris, which had a powerful influence in turning the tide of war at the Marne. The German commanders also used teams of omnibuses to hurry troops to a flank where reinforcement was called for. And many of our own soldiers were conveyed in omnibuses commandeered in London, and sent to the seat of war with all their Cadbury and Oxo and Monkey Brand advertisements still displayed. Convenience and speed were not the only advantages. Troops which otherwise might have had to march long distances, and so come fatigued to the front, were brought there quickly, but also without fatigue, and therefore more capable of efficient work.

But in no department has the power-vehicle been of greater value than in the service of the Royal Army Medical Corps. The speed with which the wounded have been brought back from the front has saved thousands of lives, and mitigated the horrors of transit to the wounded. It has occurred in cases almost countless that the soldier wounded during a morning fight has been comfortably tucked in a hospital bed on this side of the Channel within twenty-four

hours. It must be remembered that one ambulance to-day can do four times as many trips between the base hospital and the firing-line as could be done by a horsed ambulance. Indeed, this is probably too low a figure. One case is known to the writer where four trips of twenty-six miles each were done between morning and sunset. On another occasion six vehicles, holding four men each, brought back two hundred and thirty-five men in twenty-four hours. There cannot be any doubt that this efficient ambulance service saves many lives, and helps to restore thousands to duty who otherwise might be permanently non-efficient.

The power-vehicle is also invaluable for communication between commanders and their units. At every important headquarters there are a number of motor-cyclists who can carry despatches for long distances at high speed, five times as fast as by horse, and over distances that no horse could cover. Generals and their staffs can visit the different commands quite rapidly and without fatigue. General von Hindenburg, being at one time absolutely crippled by gout, was able to visit his whole command in one run, without ever getting out of his autocar.

For actual combatant purposes the power-vehicle is of enormous value. As already mentioned, armoured motors give most efficient service, and motor-bicycles are much used. These carry a machine-gun on a side-car with a protecting shield, and can be of great service in covering troops and harassing the enemy. The great guns which are now used in field duties, veritable siege-guns for smashing buildings and trenches, can be hauled at considerable speed, and artillery horse-teams can be saved from fatigue and kept fresh if their road work is done by power traction. As regards such work, the motor-vehicle can, by the aid of another ingenious device, take heavy guns over open country, through ploughed fields, and across ground which is uneven, or up and down very steep banks. This device is called the pedrail, and consists of a flat chain round the wheels, both front and back, the chain being armed with discs offering a broad flat surface to the ground. The vehicle thus has a firm base reaching from the one wheel to the other. This prevents sinking and side-slip, and saves from waste of power and possible failure of progression by preventing back-slip in soft or greasy or gravelly ground; also, the contact surface being so great, the vehicle can mount very steep gradients, and be held steady in descending similar gradients. This is a device which it may be expected will find many applications, and enable very heavy loads to be conveyed in tractors. It has already been in use, and has proved its efficiency; and there is a great future before the 'caterpillar,' as it is familiarly called.

Although generally spoken of as a non-com-

batant service, transport may be fairly said to have in many respects a combatant character under modern conditions. In former days, when range of weapons was short, the transport service to the fighting-line was fulfilled when it brought to the front, at depots outside the range of combat, the munitions necessary for replenishing gun-limbers and supplying small-arm ammunition to those told off by the fighting units to bring it forward to the line by packhorse or in boxes or haversacks borne by men. Exposure to direct risk was not called for in the transport service. Nor were the wagons nearly so numerous as they are now, when ammunition of both classes is expended in such enormous quantities, and when its weight in the case of the artillery is so very much greater than it was in former times. In the present war, the tremendous range of weapons brings the ammunition convoys into the zone of risk to a degree that was never contemplated till now. The power-vehicle makes this service more rapid and efficient. The exposure to risk is shorter in duration, and the supply employs fewer vehicles, and it can be brought forward much more rapidly. Thus the power-vehicle meets the necessities of the modern battle, where ammunition might run short from slowness of traffic and excessive length of convoys, as it is possible to convey the supplies by a train of wagons which have no horses to occupy roadway, and can carry a larger quantity in each unit, reducing the length by at least one-half, and thereby delivering much more quickly at the field depot. Speed of movement and speed of delivery are thus accelerated by the use of power traction. But in their work the members of the Army Service Corps must often pass through danger zones, and many casualties have occurred from the increased range of artillery, and the fact that, as the A.S.C. wagons necessarily go by road, to plough these roads with 'Jack Johnson' shell is a favourite ploy of the enemy's artillery when not engaged in actual battle. By the aid of their spies and their hidden telephone wires they can tell exactly when a convoy will pass a particular spot, and can concentrate a heavy fire upon it. All the injury so caused would be infinitely greater if the traction were by horse, and therefore much slower, and the convoy occupying a much greater length of road.

The introduction of the explosion engine, fed from liquid fuel, has not only improved existing war traction, but it has led to the establishment of two services which have absolute novelty, and which are proving to be of very great importance both at sea and on land. Neither the aeroplane nor the submarine could have been brought into use by any appliances which existed before the locomotive explosion engine was developed as a practical means of propulsion. Then the only possible means of moving heavy bodies mechanically was steam-power. But this

for submarine work was obviously an impossible mode, and proved to be practically impossible in the case of flying-machines. Sir Hiram Maxim came nearest to it with his remarkably light steam-engine, but was unable to produce any aeroplane fit for practical use; and if he, with his wonderfully inventive mind, could not succeed, success was not to be hoped for. But whenever it became certain that with light liquid fuel a gas-engine could be supplied with explosive mixture, the prospect opened both of locomotion under water and of locomotion in the air. And it required but little discernment to create the conviction that if experiment showed practical results, two powerful and most important auxiliaries to the efficient conduct of warfare would be at the command of belligerents. And so it has proved. The submarine has shown itself to be a very potent aid to naval service, and in the hands of an unprincipled and heartless foe a means of wholesale villainy and murder. The only comfort is to know that no other nation will be found so lost to right feeling as to sink great non-combatant ships without warning, causing cruel death to many hundreds of people of all nations, who may be peaceful passengers, and so carrying desolation to many a home. The hope is that the perpetrators of such brutal crimes will be rendered unable to do such deeds in the future, and no incentive to fight until they are brought low can be greater than that which their diabolical acts inspire. That the submarine is a valuable instrument of war is undoubted fact, and of this Great Britain has no reason to complain. But never will she use any submarine strength she may possess with such deliberate cruelty to non-combatants as within a few months to cause the death of thousands for no real military purpose, but for intimidation through attack on the lives of peaceful and harmless persons. The hope of these pirates, as they openly avowed, was to drive our ships off the sea. That hope is gone, and nothing is left to them but the shame of having indulged it. And there may be a reckoning yet.

The aeroplane has no such unsavoury history. Its work on both sides has been honourable. Indeed, there seems to be a special chivalry in the service of the air, for we read that on both sides, when an aeroplane has come down in enemy's lines, that enemy has made a point of passing over to his opponent's territory and dropping news of the aeronauts to their friends. This has a delightful ring about it, in marked contrast to the jeering from the decks of submarines at those struggling in the water, a story so horrible that it is difficult to believe, although there is strong testimony to support it, and it is not more abominable than what has been proved to be done on land.

The aeroplane supplies a want which would have been great in the present war but for air service. Distances have become so great in

modern fighting that guns can be brought into position and hid without its being possible by any scouting on the ground or use of glasses to observe with certainty what is going on; and when engagement takes place it is difficult from the ground to check ranges by observing where shots are falling, so that the object aimed at can be struck by altering elevation of guns. The aeroplane supplies the means of overcoming this difficulty. The power to fly above the ground enables observation to be made as to the location of guns and the movements of troops, and by signal to give information. The gunner can be told that his shot fell so many yards short, or so many yards past the object aimed at, and can thus be made sure of his proper elevation. And the troops in the trenches can be observed and their approximate numbers signalled, so that the attackers may be informed of the strength against them, or the defenders informed of the opponents' preparations for attack. The aeroplane can further be highly useful in dropping explosives upon depots, or factories, or railways, or bodies of troops. It is also of great service at sea, in the form of the hydroplane, which, when not in flight, can rest upon the water, being provided with air caissons instead of wheels; and such hydroplanes are now carried on the large war-ships.

A word must be said on the airship, which is really a balloon of enormous size, driven like an aeroplane by petrol-engines. For practical purposes it has been a failure, and an expensive one. It is a weapon from which the Germans expected much, and they fondly believed that as they dare not bring out their fleet to fight, they would be able by their Zeppelin airships to frighten their foes into submission. Time after time they have visited the east coast of England, and have killed a few men, women, and children, but have effected no military purpose whatever. Their crews are quite helpless in a high wind, and cannot expose themselves in the daytime. Thus they must fly at night; and being very vulnerable, and offering a large target, they must keep high up, and so cannot have any certainty of aim when they drop their bombs. They must always return to the same place, as when on the ground they require shelter in a building several hundred feet long. Their enormous bulk would make them a *ludibrium ventis* if it were attempted to leave them exposed when on the ground; and it is, of course, necessary that a Zeppelin should have a clear space of great size to enable it to land in safety, and a large staff ready to assist in the landing and securing it in its shelter.

There is no more convincing proof that the Zeppelin is a military failure than the fact that no other nation has adopted the airship for service, although expensive experiments have been made. There is a great hangar at Aldershot which was used when experimental airships were built, but it is now a depot in which the more

practical aeroplane is housed in quantities. The airship is valuable neither for action nor for intimidation, and it is probable that as aeroplanes increase in numbers their stinging may be found too much for the unwieldy gasbag from which the Germans were foolish enough to expect such great exploits.

This war will not be decided either by submarines or aircraft. They are both valuable for

combatant purposes. But the two powers with which the decision lies are the long-range gun and the *arme blanche*, whether it be bayonet or knife. It is satisfactory to know that the Allies can use both weapons—the gun and the steel—as well as, if not better than, their opponents, and that the spirit behind them is indomitable. The Allies are ready for a war of exhaustion, and have no doubt of the result.

THE DAY OF WRATH.

CHAPTER V.—BILLETS.

THE two, to some extent, were using the local *patois*; but their English hearers understood nearly every word, because these residents on the Belgian border mingle French, German, and a Low Dutch dialect almost indiscriminately. Dalroy at once endeavoured to divert the old man's thoughts. The massacre which had been actually permitted, or even organised, in the town by daylight would probably develop into an orgy that night. Not one woman now, but three, required protection. He must evolve some definite plan which could be carried out during the day, because the hordes of cavalry pressing toward the Meuse would soon deplete Joos's mill; and when the place ceased to be of value to the commissariat the protecting order would almost certainly be revoked. Moreover, Léontine Joos was young and fairly attractive.

In a word, Dalroy was beginning to understand the psychology of the German soldier in war-time.

'Let us think of the immediate future,' he struck in boldly. 'You have a wife and daughter to safeguard, Monsieur Joos; while I have Mademoiselle Beresford on my hands. Your mill is on the outskirts of the town. Is there no village to the west, somewhere out of the direct line, to which they could be taken for safety?'

'The west!' growled Joos, springing up again. 'Isn't that where these savages are going? That is the way to Liège. I asked the officer. He said they would be in Liège to-night, and in Paris in three weeks.'

'Is it true that Britain has declared war?'

'So they say. But the Prussians laugh. You have no soldiers, they tell us, and their fleet is nearly as strong as yours. They think they have caught you napping, and that is why they are coming through Belgium. Paris first, then the coast, and they've got you. For the love of Heaven, monsieur, is it true that you have no army?'

Dalroy was stung into putting Britain's case in the best possible light. 'Not only have we an army, every man of which is worth three Germans at a fair estimate; but if England has

come into this war, she will not cease fighting until Prussia grovels in the mud at her feet. How can you, a Belgian, doubt England's good faith? Hasn't England helped to maintain your nation in freedom for eighty years?'

'True, true! But the Prussians are sure of victory, and one's heart aches when one sees them sweep over the land like a pestilence. I haven't told you one-tenth'—

'Why frighten these ladies needlessly? The gun-fire is bad enough. You and I are men, Monsieur Joos. We must try to save our women.'

The miller was spirited, and the implied taunt struck home.

'It's all very well talking in that way,' he cried; 'but what's going to happen to you if a German sees you? *Que diable!* You look like an Aachen carriage-cleaner, don't you, with your officer air and commanding voice, and your dandy boots, and your fine clothes showing when the workman's smock opens! The lady, too, in a cheap shawl, wearing a blouse and skirt that cost hundreds of francs!—Léontine, take monsieur'—

'Dalroy.'

'Take Monsieur Dalroy to Jan Maertz's room, and let him put on Jan's oldest clothes and a pair of sabots. Jan's clogs will just about fit him. And give mademoiselle one of your old dresses.'

He whirled round on Dalroy. 'What became of Jan Maertz? Did the Germans really kill him? Tell us the truth. Léontine, there, had better know.'

'I think he is safe,' said Dalroy. 'I have already explained to your daughter how the accident came about which separated us. Maertz was pulled out of the driver's seat by the reins when the horses plunged and upset the wagon. He may arrive any hour.'

'The Germans didn't know, then, that you and the lady were in the cart?'

'No.'

'I hope Jan hasn't told them. That would be awkward. But what matter? You talk like a true man, and I'll do my best for you. It's nothing but nonsense to think of getting away

from Visé yet. You're a Liègeois whom I hired to do Jan's work while he went to Aix. Everybody in Visé knows he went there four days ago. I can't lift heavy sacks of grain at my age, and I must have a man's help. You see? Sharp, now. When that fat fellow gets his puff again he'll be here for more supplies. And mind you don't wash your face and hands. You're far too much of a gentleman as it is.'

'One moment,' interrupted Irene. 'I want your promise, Captain Dalroy, that you will not go away without telling me.'

She could not guess how completely old Joos's broken story of the day's events in Visé had changed Dalroy's intent.

'I would as soon think of cutting off my right hand,' he said.

Their eyes met and clashed. It was dark in the mill kitchen, even at midday; but the girl felt that the tan of travel and exposure on her face was yielding to a deep crimson. 'Come, Léontine,' she cried almost gaily, 'show me how to wear one of your frocks. I'll do as much for you some day in London.'

'You be off too,' growled Joos to Dalroy. 'When the Germans come they must see you about the place.'

The old man was shrewd in his way. The sooner these strangers became members of the household the less likely were they to attract attention.

Thus it came about that both Dalroy and Irene were back in the kitchen, and clothed in garments fully in keeping with their new rôles, when a commissariat wagon entered the yard. A Bavarian corporal did not trouble to open the door in the ordinary way. He smashed the latch with his shoulder. 'Why is this door closed?' he demanded fiercely.

'Monsieur'—began Joos.

'Speak German, you swine!'

'I forgot the order, Herr Kaporal. As you see, it was only on the latch.'

'Don't let it happen again. Load the first wagon with hay and the second with flour. While you're at it, these women can cook us a meal. Where do you keep your wine?'

'Everything will be put on the table, mons—Herr Kaporal.'

'None of your lip!—Here, you, the pretty one, show me the wine-cupboard. I'll make my own selection. We Bavarians are famous judges of good wine and pretty women, let me tell you.'

The corporal's wit was highly appreciated by the squad of four men who accompanied him. They had all been drinking. It is a notable fact that during the early days of the invasion of Belgium and France—in effect, while wine and brandy were procurable by theft—the army which boasts the strictest discipline of any in the world was unquestionably the most drunken that has ever waged successful war.

Irene was 'the pretty one' chosen as guide by this hulking connoisseur, but she knew how to handle boors of his type.

'You must not talk in that style to a girl from Berlin,' she said icily. 'You and your men will take what is given you, or I'll find your *oberlieutenant*, and hear what he has to say about it.'

She spoke purposely in perfect German, and the corporal was vastly surprised.

'Pardon, *gnadige Fraulein*,' he mumbled with a clumsy bow. 'I no offence meant. We will within come when the meal is ready. About—turn!' The enemy was routed.

The miller and his man worked hard until dusk. The fat officer turned up, and lost no opportunity of ogling the two girls. He handed Joos a payment docket, which, he explained grandiloquently, would be honoured by the military authorities in due course. Joos pocketed the document with a sardonic grin. There was some fifteen thousand francs worth of grain and forage stored on the premises, and he did not expect to see a centime of hard cash from the Germans, unless, as he whispered grimly to Dalroy, they were forced to pay double after the war. Meanwhile the place was gutted. Wagon after wagon came empty and went away loaded.

Dribblets of news were received. The passage of the Meuse had been achieved, thanks to a flanking movement from Argenteau. Liège had fallen at the first attack. The German High Sea Fleet was escorting an army in transports to invade England, where, meanwhile, Zeppelins were destroying London. Visé, having been sufficiently 'punished' for a first offence, would now be spared so long as the inhabitants 'behaved themselves.' If a second 'lesson' were needed, it would be something to remember.

The first and last of these items were correct, inasmuch as they represented events and definite orders affecting the immediate neighbourhood. Otherwise, the budget consisted of even more daring flights of Teutonic imagination, the crescendo swelling by distance. Liège was so far from having fallen that the 7th Division, deprived of the support of the 9th and 10th Divisions, had been beaten back disastrously from the shallow trenches in front of the outer girdle of forts. The 10th was about to share the same fate; and the 9th, after being delayed nearly three days by the glorious resistance offered by the Belgians at Visé, was destined to fare likewise. But rumour as to the instant 'capture' of Liège was rife not among the lower ranks alone of the German army. The Commander-in-Chief actually telegraphed the news to the All-Highest at Aix. When the All-Highest discovered the truth the Commander-in-Chief decided that he had better blow his brains out, and did.

The fact was that the overwhelming horde of invaders could not be kept out of the city of

Liège by the hastily mobilised Belgian army; but the heroic governor, General Leman, held the ring of forts intact until they were pulverised by the heavy ordnance of which Dalroy had seen two specimens during the journey to Cologne. Many days were destined to elapse before the last of the strongholds, Fort Loncin, crumbled into ruins by the explosion of its own magazine; and until that was achieved the mighty army of Germany dared not advance another kilometre to the west.

When the Bavarian corporal had gone through every part of the house and outbuildings, and satisfied himself that the only stores left were some potatoes and a half-bag of flour, he informed the miller that he and his squad would be billeted there that evening.

'Your pantry is bare,' he said, 'but the wine is all right; so we'll bring a joint which we "planted" this morning. Be decent about the wine, and your folk can have a cut in, too.'

Possibly he meant to be civil, and there was a chance that the night might pass without incident. Visé itself was certainly quiet save for the unceasing stream of troops making for the pontoon bridge. The fighting seemed to have shifted to the west and south-west, and Joos put an unerring finger on the situation when he said pithily, 'Liège is making a deuce of a row after being taken.'

'How many forts are there around the city?' inquired Dalroy.

'Twelve, big and little. Pontisse and Barchon cover the Meuse on this side, and Fleron and Evigné bar the direct road from Aix. Unless I am greatly in error, monsieur, the German wolf is breaking his teeth on some of them at this minute.'

Liège itself was ten miles distant; Pontisse, the nearest fort, though on the left bank of the river, barely six. The evening was still, there being only a slight breeze from the south-west, which brought the loud thunder of the guns and the crackle of rifle-fire. It was the voice of Belgium proclaiming to the high gods that she was worthy of life.

The Bavarians came with their 'joint,' a noble piece of beef hacked off a whole side looted from a butcher's shop. Madame Joos cut off an ample quantity, some ten pounds, and put it in the oven. The girls peeled potatoes and prepared cabbages. In half-an-hour the kitchen had an appetising smell of food being cooked, the men were smoking, and a casual visitor would never have resolved the gathering into its constituent elements of irreconcilable national hatreds.

The corporal even tried to make amends for having damaged the door. He examined the broken latch. 'It's a small matter,' he said apologetically. 'You can repair it for a trifle; and, in any case, you will sleep all the better that we are here.'

Though somewhat maudlin with liquor, he was very much afraid of the 'girl from Berlin.' He could not sum her up, but meant to behave himself; while his men, of course, followed his lead unquestioningly.

Dalroy kept in the background. He listened, but said hardly anything. The turn of fortune's wheel was distinctly favourable. If the night ended as it had begun, there was a chance that he and Irene might slip away to the Dutch frontier next morning, since he had ascertained definitely that Holland was secure for the time, and was impartially interning all combatants, either Germans or Belgians, who crossed the border. At this time he was inclined to abandon his own project of striving to steal through the German lines. He was somewhat weary, too, after the unusual labour of carrying heavy sacks of grain and flour down steep ladders or lowering them by a pulley. Thus he dozed off in a corner, but was aroused suddenly by the entry of the commissariat officer and three subalterns. With them came an orderly, who dumped a laden basket and a case of champagne on the floor.

The corporal and his satellites sprang to attention.

The fat man took the salute, and glanced around the kitchen. Then he sniffed. 'What! roast beef?' he said. 'The men fare better than the officers, it would seem.—Be off, you!'

'Herr Major, we are herein billeted,' stammered the corporal.

'Be off, I tell you, and take these Belgian swine with you! I make my quarters here to-night.'

Joos, of course, he recognised; and the miller said, with some dignity, that the gentlemen would be made as comfortable as his resources permitted, but he must remain in his own house.

The fat man stared at him, as though such insolence were unheard of. 'Here,' he roared to the corporal, 'pitch this old hog into the Meuse. He annoys me.'

Meanwhile one of the younger officers, a strapping Westphalian, lurched toward Irene. She did not try to avoid him, thinking, perhaps, that a passive attitude was advisable. He caught her by the waist, and guffawed to his companions, 'Didn't I offer to bet you fellows that Busch never made a mistake about a woman? Who'd have dreamed of finding a beauty like this one in a rotten old mill?'

The Bavarians had collected their rifles and side-arms, and were going out sullenly. Each of the officers carried a sword and revolver.

Irene saw that Dalroy had risen in his corner. She wrenched herself free. 'How am I to prepare supper for you gentlemen if you bother me in this way?' she demanded tartly.

'Behave yourself, Fritz,' puffed the major.

'Is that your idea of keeping your word? *Mama*, if she is discreet, will go to bed, and the young ones will eat with us.—Open that case of wine, orderly. I'm thirsty.—The girls will have a drink too. Cooking is warm work.—Hullo! What the devil! Kaporal, didn't you hear my order?'

Dalroy grabbed Joos, who was livid with rage. The two girls were safe for the hour, and must endure the leering of four tipsy scoundrels. A row at the moment would be the wildest folly.

'March!' he said gruffly. 'The *oberlieutenant* doesn't want us here.'

'*Le brave Belge* knows when to clear out,' grinned one of the younger men, giving Dalroy an odiously suggestive wink.

Somehow, the fact that Dalroy took command abated the women's terror; even the intractable Joos yielded. Soon the two were in the yard with the dispossessed Bavarians, these latter being in the worst of temper, as they had now to search for both bed and supper. They strode away without giving the least heed to their presumed prisoners.

Joos, like most men of choleric disposition, was useless in a crisis of this sort. He gibbered with rage. He wanted to attack the intruders at once with a pitchfork.

Dalroy shook him to quieten his tongue. 'You must listen to me,' he said sternly.

The old man's eyes gleamed up into his. In the half-light of the gloaming they had the sheen of polished gold. 'Monsieur,' he whimpered, 'save my little girl! Save her, I implore you. You English are lions in battle. You are big and strong. I'll help. Between us we can stick the four of them.'

Dalroy shook him again. 'Stop talking, and listen!' he growled wrathfully. 'Not another word here! Come this way!' He drew the miller into an empty stable, whence the kitchen door and window were in view. 'Now,' he muttered, 'gather your wits, and answer my questions. Have you any hidden weapons? A pitchfork is too awkward for a fight in a room.'

'I had nothing but a muzzle-loading gun, monsieur. I gave it up on the advice of the burgomaster. They've killed him.'

'Very well. Remain here on guard. I'll go and fetch a rifle and bayonet. Nothing will happen to the women till these brutes have eaten, and have more wine in them. Don't you understand? The younger men have made a hellish compact with their senior. You heard that, didn't you?'

'Yes, yes, monsieur. Who could fail to know what they meant? Surely the good God sent you to Visé to-day!'

'Promise, now! No interference till I return, even though the women are frightened. You'll only lose your life to no purpose. I'll not be long away.'

'I promise. But, monsieur, *pour l'amour de Dieu*, let me stick that fat Busch!'

Dalroy was in such a fume to secure a reliable arm that he rather neglected the precautions of a soldier moving through the enemy's country. It was still possible to see clearly for some distance ahead. Although the right bank of the Meuse that night was overrun with the Kaiser's troops along a front of nearly twenty miles, the ravine, with its gurgling rivulet, was one of those peaceful oases which will occur in the centre of the most congested battlefield. Now that the crash of the guns had passed sullenly to a distance, white-tailed rabbits scurried across the path; some stray sheep, driven from the uplands by the day's tumult, gathered in a group and looked inquiringly at the intruder; a weasel, stalking a selected rabbit as in his piratical way, elected to abandon the chase and leap for a tree.

These very signs showed that none other had breasted the slope recently, so Dalroy strode out somewhat carelessly. Nevertheless, he was endowed with no small measure of that sixth sense which every *shikari* must possess who would hunt either his fellow-men or the beasts of the jungle. He was passing a dense clump of brambles and briars, when a man sprang at him. He had trained himself to act promptly in such circumstances, and had decided long ago that to remain on the same ground, or even try to retreat, was courting disaster. His plan was to jump sideways, and, if practicable, a little nearer an assailant. The sabots rendered him less nimble than usual, but the dodge quite disconcerted an awkward opponent. The vicious downward sweep of a heavy cudgel just missed his left shoulder, and he got home with the right in a half-arm jab which sent the recipient sprawling nearly into the stream.

Dalroy made after him, seized the fallen stick, and recognised—Jan Maertz! 'How now,' he said wrathfully, 'are you, too, a Prussian?'

Jan raised a hand to ward off the expected blow. '*Caput!*' he cried. 'I'm done! You must be the devil! But may the Lord help my poor master and mistress, and the little Léontine!'

'That is my wish also, sheep's-head! What evil have I done you, then, that you should want to brain me at sight?'

'They're after you—the Germans. They mean to catch you, dead or alive. A lieutenant of the Guard pulled me away from in front of a firing-party, and gave me my life on condition that I ran you down.'

Here was an extraordinary development. It was vitally important that Dalroy should get to know the exact meaning of the Walloon's disjointed utterances; yet how could he wait and question the man while the Prussian sultans were feasting in the mill?

Dalroy stooped over Maertz, who had risen to

his knees, and caught him by the shoulder. 'Jan Maertz,' he said, 'do you hope to marry Léontine Joos? If so, Heaven has just prevented you from committing a great crime. She, and her mother, and the lady who came with me from Aix are in the mill with four German officers—a set of foul, drunken brutes who will stop at no excess. I'm going now to get a rifle. You make quietly for the stable opposite the kitchen door. You will find Joos there. He will explain. Tell me, are you for Belgium or Germany in this war?'

The Walloon might be slow-witted, but Dalroy's words seemed to have pierced his skin.

'For Belgium, monsieur, to the death!' he answered.

'So am I. I'm an Englishman. As you go, think what that means.'

Leaving Maertz to regain his feet and the stick, Dalroy rushed on up the hill. The unexpected struggle had cost him but little delay; yet it was dark, and the miller was nearly frantic with anxiety when he returned.

'Is Maertz with you?' was his first question.

'Yes, monsieur,' came a gruff voice out of the gloom of the stable.

'Do you know now how nearly you blundered?'

'Monsieur, I would have tackled St Peter to save Léontine.'

'Quick!' hissed Joos; 'let us kill these hogs! We have no time to spare. The others will be here soon.'

'What others?'

'Jan will tell you later. Come, now. Leave Busch to me!'

'Keep quiet!' ordered Dalroy sternly. 'We cannot murder four men in cold blood. I'll listen over there by the window. You two remain here till I call you.'

But there was no need for eavesdropping. Léontine's voice was raised shrilly above the loud-clanging talk and laughter of the uninvited guests. 'No, no; my mother must stay!' she was shrieking. 'Monsieur, for God's sake, leave my mother alone! Ah! you are hurting her.—Father! father!—Oh, what shall we do? Is there no one to help us?'

(Continued on page 99.)

THE GRAVE OF NATURE.

By D. GATH WHITLEY.

ALEXANDER VON HUMBOLDT wrote a charming work entitled *Aspects of Nature*; this article will describe a region which is justly called 'Nature's Grave.'

It is a land of silence and solitude; a land which is abandoned to the spirits of loneliness and desolation; a land like that described by the prophet, where 'no man can dwell, nor son of man pass through;' a land in which, though the seasons may come and go, they bring no change in its eternal dreariness; a land in which the winds of winter and the suns of summer cannot wake the sleep of death. This land is the north-east extremity of Siberia.

Let the reader take a map and examine this region, for it is worth while to study it, in order to realise its awful character. It resembles, speaking roughly, a huge triangle, the point of which is found at Behring Strait. The base is formed by the river Lena, which, flowing from south to north, enters into the Arctic Ocean. The southern side of the triangle is formed by the Stanovoi Mountains, which end near the mouth of the Anadir, and shut it off from the more genial portions of Siberia which lie to the south. The northern side of the vast triangle is formed by the Arctic Ocean. Three large rivers flow through the heart of this region of desolation, and empty themselves into the Arctic Ocean. They are—proceeding from west to east—the Yana, the Indigirka, and the Kolyma. In the winter they are covered with a sheet of solid ice more than ten feet thick.

The features of this vast waste are dreary and monotonous in the extreme. When the Verko-yansk Mountains (which form part of its southern limit) are crossed, a great plain is entered, which slopes slowly toward the Arctic Ocean. At first low swelling hills, covered with dark forests of pine and larch, amidst which nestle innumerable lakes and endless morasses, are encountered. But by-and-by these get fewer and fewer, then they altogether cease, and vast plains, consisting of bogs, swamps, and quaking morasses, interspersed with featureless wastes of stony clay, stretch away in unbroken monotony toward the Arctic Ocean. These are called the *Tundras*, and are either mossy or stony, according to the prevailing character of their features.

The *Mossy Tundras* are vast swamps, which are absolutely impassable in summer, owing to the depths of their morasses, and the myriads of mosquitoes which make them their home. Not even the natives dare to traverse these swampy wildernesses during the summer, and all travelling in these solitudes ceases between the months of May and September. From any eminence the eye wanders over the sea-like expanse, which extends in gently swelling undulations to the horizon. Here and there little hillocks rise above the monotonous level, which are often gay with flowers and covered with diminutive bushes. Vast swamps and stagnant pools, over which hover clouds of mosquitoes, appear on all sides, and are utterly wearying in their unending sameness. But the prevailing feature of these swampy

wildernesses is the utter solitude and lifelessness that prevail. The stillness is unbroken, and a dreary monotony reigns on every side, which has led to its being said of them—

They seem inaccessible to joy or to pain,
The types of everlasting rest.

It is only possible to cross these wildernesses of bog, moss, and morass in winter, when they are frozen hard and covered with snow. Reindeer sledges are used in their southern portions, but farther north only dogs can be found to draw the sledges. In passing over these vast snowy expanses by day the sledge of the traveller seems to be in the midst of a boundless pure white sea, on whose dazzling expanse the mirage hovers in strange forms and colours. But by night the spectacle is solemn and unearthly. It is thus vividly described by one who witnessed the weird and ghostly scene:

‘The night was clear, still, and intensely cold, the thermometer at sunset marking 44° below zero, and sinking rapidly to 50° as the rosy flush in the west grew fainter and fainter, and darkness settled down upon the vast steppe. Many times before in Siberia and Kamchatka I had seen nature in her sterner moods and winter garb; but never before had the elements of cold, barrenness, and desolation seemed to combine into a picture so dreary as the one which was presented to us that night near Behring Strait. Far as the eye could pierce the gathering gloom, in every direction lay the barren steppe like a boundless ocean of snow, blown into long wave-like ridges by previous storms. There was not a tree or a bush, or any sign of animal or vegetable life, to show that we were not travelling on a frozen ocean. All was silence and desolation. The country seemed abandoned by God and man to the Arctic Spirit, whose trembling banners of auroral light flared out fitfully in the north in token of his conquest and dominion. About eight o'clock the full moon rose huge and red in the east, casting a lurid glare over the vast field of snow; but as if it too were under the control of the Arctic Spirit, it was nothing more than the mockery of a moon, and was constantly assuming the most fantastic and varied shapes. Now it extended itself laterally into a long ellipse, then gathered itself up again into the semblance of a huge red urn, lengthened out to a long perpendicular bar, with rounded ends, and finally became triangular. It can hardly be imagined what added wildness and strangeness this blood-red, distorted moon gave to a scene already wild and strange. We seemed to have entered upon some frozen, abandoned world, where all the ordinary laws and phenomena of nature were suspended, where animal and vegetable life were extinct, and from which even the favour of the Creator had been withdrawn. The intense cold, the solitude, the oppressive silence, and the red, gloomy moon-

light, like the glare of a distant but mighty conflagration, all united to excite in the mind feelings of awe, which were perhaps intensified by the consciousness that never before had any human being, save a few wandering Chookchees, ventured in winter upon these domains of the Frost King.’ (*Tent Life in Siberia*, by George Kennan, pp. 310, 311.)

The cold during the winter is simply indescribable. Verkoyansk, on the river Yana, is called ‘the coldest place in the world.’ Here, in the depth of winter, the thermometer will sometimes fall to 90° below zero Fahrenheit, and the average temperature for January, which is the coldest month of the year, is 60° below zero. No wonder that the Russians say, ‘No matter from whence the wind may blow, it is always cold at Verkoyansk.’ The aspect of the place is weird and solemn. It is merely a short row of log-houses standing above a lifeless, icy stream, and backed by a dark, funereal pine forest. It is almost impossible to realise the awful cold that prevails here in the depth of winter. Breathing becomes difficult; the intense cold seems to suppress all life and motion; a deep, awe-inspiring silence reigns on every side; and the reindeer retire into the depths of the forest, and stand motionless as if deprived of life. Mr De Windt tells us that the governor of Yakutsk, six hundred miles distant, who had held his post for nearly twenty years, had never summoned sufficient courage to visit Verkoyansk.

During the winter, which is the only time when these icy wildernesses can be crossed, the experiences of the traveller’s company are melancholy in the extreme. In the southern regions the sledges are drawn by reindeer, but farther north the journey has to be performed by the aid of dogs, the only animals available for transport. Travelling in the depth of winter is a fearful experience. Wrapped up in furs which weigh from thirty to forty pounds, the traveller, if he be on horseback, can scarcely move, and cannot descend from his horse. Ice forms over his face and nostrils, and the icicles have to be removed from the lips and noses of the beasts of burden to save them from suffocation. The very trunks of the trees split open with violent reports from the intensity of the cold. Should the wind rise, death is almost certain, for clouds of snow, swept onward by the violence of the hurricane, blind and bewilder the traveller, and unless some shelter be gained life is speedily extinguished. In the vast frozen plains near the Arctic Ocean the reindeer crowd together in herds for warmth, and stand motionless; an appalling silence reigns; and the only creatures that can face the awful cold are the raven, which slowly wings its heavy flight through the icy air, and the snowy-owl, the true habitant of the Arctic regions. (See Wrangell’s *Siberia and the Polar Sea*, pp. 49, 374.)

In the wooded districts where the larch and

the pine form dark and dreary forests, the wolf is the cruel tyrant of the solitudes, and packs of these ferocious animals sweeping through the forests after nightfall make the woods resound with their dismal howlings. Miss Marsden, who was being driven through the Siberian forests in the night, had a startling experience of this peril. It was dark, and on each side of the narrow track there rose gloomy woods, whose sombre outline could just be perceived in the darkness. Suddenly amongst the trees the lady saw glistening lights which were amongst the foliage on both sides of the road. Turning to the driver, she said, 'We shall soon be at our journey's end, for I can see the lights of cottages amongst the trees near the road.' The driver made no reply, but urged his horses at a greater speed. The lights were still seen amidst the trees by the side of the narrow forest road, and Miss Marsden repeated her remark. The driver turned toward her, and said bluntly, 'Lady, those lights you see by the sides of the track do not come from cottages; they are the eyes of the wolves who are watching us from amongst the trees!'

All through the horrors of the long Arctic night the aurora is the spectacle which fills the beholder with awe and admiration. When he is driving in his reindeer sledge over the boundless white expanses of the snowy plains during the night, the superb flames of the Northern Lights, as they spread their wavering glow over the snowy wastes, are unspeakably sublime. Mr Kennan once witnessed an aurora at the Russian settlement of Anadyrsk—a mere cluster of log-huts in a vast pine forest—which was unsurpassable in its sublimity. The whole northern sky seemed on fire, and looked like a blood-red ocean. An arch of brilliant prismatic colours spanned the heavens, from which shot up luminous bands and fringes of crimson and yellow. The auroral bow with its wavering streamers moved up and down toward the zenith. Every instant the display increased in unearthly grandeur; the luminous bands revolved like the spokes of a great fiery wheel; and then mighty crimson and yellow arches broke up into many perpendicular bars which exhibited all the colours of the rainbow. The spectacle was beyond all description in its awful grandeur, and the terror-stricken natives cried aloud, 'God have mercy!' (*Tent Life in Siberia*, pp. 322–335.)

Another wonderful phenomenon of this frightful region is the *perpetually frozen soil*, mingled with *solid ice*, which underlies the surface soil through tens of thousands of square miles. This occurs all through Northern Siberia, but it is found in its greatest intensity in the north-eastern region, to which this paper particularly refers. In Yakutsk, the capital of the territory, there are no wells, and the inhabitants drink the water from the river in summer, and thaw the snow in winter. The reason for this

is that the soil beneath the city is permanently frozen and *never thaws*. If pits are sunk in summer the soil is found to be as hard as a rock, and no water is obtainable, even at the greatest depths. Farther north *solid ice* appears beneath the frozen soil, and rises higher and higher as the Arctic Ocean is approached. At last, on the shores of the Polar Sea, cliffs of solid ice present themselves, in which black layers of frozen soil occur.

Still stranger are the *islands of ice* which are found off this fearful coast. These consist of dark cliffs of *solid ice*, over which lies a thin layer of soil, on which grass grows, and flowers, moss, and brightly coloured lichens flourish in beautiful luxuriance. This thin vegetable carpet can be easily stripped off, and then the solid ice appears beneath. In these islands are lakes with sloping banks of solid ice, which, though split in all directions into deep chasms, *never thaw*. Along the coasts of the Arctic Ocean there are solid ridges of ice. These never thaw, although split into clefts and cracks of great depth. These are not icebergs which have stranded on the beach, but are the permanent ridges which form the coast-line. The remarkable islands called the Liakoff and New Siberian Islands, which lie in the Arctic Ocean to the north of Siberia, contain cliffs of solid ice, which are found not only on the coast, but inland also. Baron Toll, who visited the islands in 1886 and 1893, calls these permanent ice-masses 'fossil glaciers,' and says that the ice cannot have come from the snow, as it has everywhere a granular structure, and therefore these extraordinary ice-masses must be considered as relics of the great ice-sheet which overspread these regions during the Glacial period. These marvellous islands merit the strictest scientific examination.

The term 'Grave of Nature,' which we have applied to North-East Siberia, is found to be still more appropriate when we consider that the whole of this region is one vast graveyard, filled with the bones of animals which have perished within comparatively recent times. Little does the traveller think, as he drives in his reindeer sledge over the dreary wastes of snow, and sees no living thing save the Arctic fox, the raven, and the snowy-owl, that the ground below him, only a few feet beneath his sledge, is packed full of the bones of enormous animals which have perished in some mysterious manner since man appeared upon the earth. Such, nevertheless, is the extraordinary fact. The whole of Northern Siberia, from the Ural Mountains to Behring Strait, is one vast graveyard filled with animal remains. The bones, teeth, and skulls are those of elephants, rhinoceroses, buffaloes, and musk-oxen. These bones occur everywhere. They are found on the banks of the rivers, in the plains, on rising ground, and in frozen cliffs. On the shores of the Arctic Ocean there are sloping banks of ice. These are split and furrowed in all directions

with deep chasms, and as the traveller looks down into their dark depths from above, he sees that the lower portions of these icy chasms are filled with the tusks, bones, and skulls of elephants and rhinoceroses in countless abundance!

In other places on the northern coast of Siberia fronting the Arctic Ocean the low cliffs which rise above the beach, and are formed of earth and clay, are full of the bones of elephants and rhinoceroses. In the brief summer, which hardly lasts for six weeks, portions of these earthy cliffs thaw and fall on the beach below. Then it is that the traveller who walks along the shore witnesses an astonishing spectacle. Not only does he observe icebergs stranded on the beach, but he also sees the tusks, bones, and teeth of elephants (the mammoth) lying on the shore, and whitening the beach for long distances! If he leaves the Arctic Ocean behind, and journeys inland, the same sights constantly meet his astonished gaze. He comes, it may be, to a plain, where for perhaps half a mile the whole ground seems to be formed of masses of tusks, teeth, and bones of elephants and rhinoceroses welded together in one confused mass in the frozen soil. These mighty beasts must have been destroyed in herds, but how they perished no one knows. Still more amazing is the fact that the islands in the Arctic Ocean north of Siberia are equally full of the tusks and bones of elephants and rhinoceroses; and on the shores of these islands

in the Polar Sea the tusks of elephants can be seen sticking up like trunks of trees in the frozen sand!

Stranger still, actually the very bodies of these great elephants, with flesh, fur, and hair perfect, are seen standing upright in the frozen cliffs. When the cliffs thaw, the bodies of these great elephants fall to the ground, and are so perfect, after being entombed for thousands of years, that the wolves eat the flesh!

There are many who maintain that a great future is before Siberia, owing to its vast mineral wealth and its corn-producing power. This applies to the southern districts, but has nothing to do with the regions of awful desolation to which we have referred. Into these silent solitudes man cannot penetrate except when the land is buried in ice and snow. The snow does not melt here from off the surface of the ground until the middle of June, and many of the rivers are covered again with solid ice by the middle of August. It is truly the 'Realm of the Ice-King.' Well may Von Wrangel say of these awful icy wildernesses: 'Here there is nothing to invite. Endless snows and ice-covered rocks bound the horizon. Nature lies shrouded in almost perpetual winter. Life is a continual conflict with privation and with the terrors of cold and hunger. What led men to forsake more favoured lands for this Grave of Nature, which contains only the bones of an earlier world?' (*Siberia and the Polar Sea*, pp. 52, 53.)

SINGLE-HANDED.

CHAPTER II.

HE closed the shutter, and patiently worked the bolt back into place, filling the tiny crack made by his tool with rotten wood from a pile; then he found his way back beneath the gang-plank. He had decided that this vessel must be a scout for some hostile war-ship; hence her elaborate precautions to sail under false colours in waters where the navies of the Allies were in control. However, there was no war-vessel of any Power in this port just now, and she would doubtless slip away to sea before he could arrange an effective plan to stop her. Only one plan seemed to offer any chance. The risk was great, but he determined to take it. But how? Every inch of the ship was brightly lighted; men came and went everywhere. He knew that, in spite of the casual appearance of things, a sharp lookout was being kept.

As he pondered he heard voices close over his head carrying on a heated colloquy in bad Dutch and worse Spanish. He drew himself up to the edge and risked a peep. The bulky captain confronted a swarthy little man in uniform, who seemed to represent the harbour authorities. This functionary had informed the

captain that he could not sail till morning. Certain regulations of the port had not been complied with. The captain expostulated; he wanted his clearance papers. The officer admitted that the matter might be arranged, by the payment of fines and other means.

It was a plain case of hold-up for a substantial sum. The big captain did not take kindly to it. In fact, his attitude toward the suave representative of the authorities was decidedly discourteous. He raged and swore; he would not be blackmailed, so he would wait till morning, and have this person fired. He stamped off the ship, muttering. But, under the gang-plank, Crane drew a sigh of relief. This would give him his chance.

It was nearly midnight when he unfolded his cramped limbs and drew himself up to the edge of the wharf. He had turned his skiff adrift. The long dock was deserted; most of the lights had been turned off. His ears had told him that a single watchman paced the deck of the ship, making regular rounds. This man had just passed down toward the stern; he disappeared behind the deckhouse. Crane tossed his bag

over the edge and hoisted himself after it; then he picked it up and ran to the forward hatchway, moving noiselessly in his rubber-soled tennis-shoes.

Luck was with him; the hatch-cover had not been battened down. He dropped hastily through, bag and all, climbed down the ladder, and crouched behind a pile of freight, hearing the measured tread of the watchman pass over his head. Then he drew a long breath and looked around him.

He was in the forward hold, a large room, taking up nearly all the space ahead of the engine-room, from which it was separated by a steel bulkhead pierced by one door. The room did not run forward to a point in the prow, however, but was cut off square by another steel bulkhead where the beam of the vessel narrowed to some eighteen feet. This bulkhead showed no door. The hold was piled with freight, generally to within a few inches of the ceiling, except for a clear space of some twenty feet next to the forward wall, and two narrow corridors between the piles, running back to the engine-room partition. The place was lighted by several incandescent bulbs, and was ventilated by a row of circular openings through the ceiling, each some eighteen inches in diameter and protected on deck by the usual metal funnels, which stood about six feet high, with the upper end turned inboard to keep out rain and the surf from heavy seas. The place reeked with the characteristic odour of copra, and he breathed his heartfelt thanks that the pearl-shell portion of the vessel's cargo, with its penetrating stench, had evidently been stored elsewhere.

These details Crane noted in his search for his most immediate need—a temporary hiding-place. He knew that as soon as the ship put to sea the hatch would be battened down, and opened only occasionally, to take out supplies or to handle cargo. Now he searched the piles of freight, and finally found a place where a narrow space remained between the upper tier of boxes and the ceiling. By shifting the boxes somewhat, he contrived a cubby-hole in which he could lie at full length, with his head on his bag, safely hidden, unless some one should crawl in to look for him. There was a certain risk, of course; but he had to take it, and he took it, with his automatic pistol lying ready to his hand.

One of the ventilators opened above his head, and the fresh air was very welcome. He dozed quite comfortably for the next few hours, waking, alert, at times when the tread of the watchman on deck passed within a few inches of his face. He was glad he did not have the habit of snoring.

Presently there were sounds of the ship's bell and the awakened activity of morning. Men came into the hold and worked at shoring up the cargo against shifting in heavy seas. They talked a little among themselves, always in Dutch, but only personalities and comments on

the work in hand. After what seemed an interminable time they went out, and the heavy hatch-cover was dropped. Soon the screws began to revolve, there were loud commands, and a great scuffling of feet on deck, and Crane knew that the ship was under way. The die was cast, and somehow his clearest sensation was as the loosening of a certain tension. There could be no turning back now; he was committed to this course to the end of the chapter; and he turned to the work ahead with a curious elation of spirit. Also, he permitted to himself the material comfort of producing some sandwiches from his bag and making his breakfast, for he was ravenously hungry.

Nearly all that day he lay in his hiding-place, venturing out only for a brief reconnaissance to fix in his mind certain information that he needed for formulating his plans. On one important point he had had grave misgivings, and he was relieved to find that they were groundless. He had been able to bring only a little food with him, and had to risk finding a supply on board; so he was glad to discover a plentiful supply of canned meats and vegetables, nuts, &c.; and he also found a fresh-water faucet in one corner, and took a much-needed drink.

One of the things on his mental list he managed to accomplish that day. He wished to find a way to get a peep out on deck. While he was pondering this problem his eye fell on the ventilator-opening near him. He soon found that he could thrust his shoulders through it, and, laying hold of a projecting brace-bolt, he drew himself up till he could peer out into the open air. His view commanded the forward deck and the upper works; the deckhouse and bridge cut off sight of the stern. Land was already low down on the horizon. Two officers stood on the bridge, and some of the crew were busy at routine tasks on deck. He risked only a brief glimpse, for he had no wish to test what might happen should one of them look up and see his face staring out at them.

After the dog-watch had passed, however, and the ship had settled down for the night, he slid from his perch, feeling he would be reasonably secure for some hours. The most pressing problem was to find some place where he would be safe from discovery and fairly comfortable. Searching among the piles of freight, he soon found a place that suited him perfectly.

In the wall of boxes that lined one of the corridors, well back toward the engine-room bulkhead, was a place where the first six feet in height was built up of small cases of kerosene-tins. On top of these was piled a tier of the long boxes that had first excited his suspicion at Coatzacoalcos. By prising at one of the small cases he soon loosened it and slid it out. The next one came out easily. Carrying these cases forward, he built them into an unfinished tier of similar ones, reckoning that so slight a change

in the arrangement of freight would not be noticed. Working in this manner, he finally produced a chamber some eight feet long by four feet wide, in which he could just stand erect. The last boxes taken out he used to rebuild the outside tier, holding them safely in place with wedges. By pushing two of them aside he could crawl in and out.

He soon transferred his belongings to these palatial quarters, and proceeded to furnish and provision them. Bits of sacking, straw, and shavings from broken packing-cases made up a passable bed. Several small boxes of tinned meats and vegetables, not readily missed from the large stock, were stored against the wall; and when a large empty oil-can had been cleaned and filled with fresh water from the faucet, he felt able to stand a siege.

He now carried his bag into his new home, and closed his door of boxes; for his watch showed five o'clock A.M., and he saw no reason for running unnecessary risks by working when the full crew were awake. By way of completing his furnishing, he hung his electric push-button lamp on a peg in the wall, then produced from the bag a folded chart of the Pacific Ocean and a small compass. The compass was placed on a box, while the map was tacked on the wall opposite his bunk. Several times since he had been aboard he had counted the beat of the screws by his watch, and made calculations of the ship's speed, and also noted the compass bearing. He now proceeded to plot her course on the chart, and found that she was bearing on a line about a hundred miles north and east of Honolulu, cutting the course of vessels bound from that popular port of call to the west coast cities of the United States. This matter settled, he made a hearty meal on American pork and beans and canned tomatoes, stretched his tired body on his bed of straw, and was shortly sound asleep.

He awoke late in the afternoon, conscious of voices in the forward part of the hold. There seemed to be a number of men engaged in some sort of drill, as the sound of short, crisp commands reached him, though he could not distinguish the words. Also, there were sharp clangs of metal and the shuffling of feet. This continued for half-an-hour, while he strained his ears to discover its meaning. Presently it ceased, the men filed out, and the hatch-cover was slammed down.

After waiting for some minutes, and hearing no sound, he slipped out and went forward to investigate. The wooden porthole shutters had been opened, but otherwise he could see no evidence of the recent activity. Standing in the open space and peering around, he suddenly dropped flat on the floor and crawled rapidly behind a pile of freight. A man's head had passed by outside one of the portholes. Listening carefully, he heard a slight bumping and scraping

against the outside of the hull. He climbed to his ventilator lookout station and peered out. Two painters were at work on the funnels, swinging in bo's'un's chairs, and the red-and-black coats of these were rapidly changing to a dingy blue-gray. He surmised that the red band around the vessel's hull was likewise merging into the prevailing neutral tint, making her much more difficult to distinguish at a distance or at night. All doubt as to the ship's nationality had now left his mind. She was surely a German craft, disguised as a Dutch trader, and manned by a crew proficient in that language, carrying out her elaborate masquerade for some purpose which, whatever it might be, boded no good to Britain. His task was to find out what she was doing and how she was doing it, and give warning to some vessel of the Allies.

The funnels were not smoking now. They seemed to reserve that function for the benefit of curious eyes only. But above the edge of one of them rose the head and shoulders of a lookout, with a telescope, busily scanning the horizon. He stood inside the big steel cylinder, probably on a grill-work floor a few feet below the top—a cleverly devised crow's-nest, truly!

Crane's next task, when night had brought his chosen work-time, was to get connection with the ship's telephone system. He had marked the location of the wires along the ceiling, coming in over the rear bulkhead and passing out through the forward one. Out of his bag he took a coil of small insulated copper wire, brought for this very purpose. He made a connection with the main just beside a stanchion, pushing the tiny wires out of sight in a convenient crack that led behind the freight, thence between the cases and on to his chamber. This work he performed with the greatest care, as a short-circuit on the line might lead to a search and the discovery of his tap, with the wires making a plain trail to his lair. That bottomless bag of his likewise furnished a small field telephone instrument, such as line-men carry. This was connected up with the wires and hung on a peg just above the head of his bunk. It had no bell, of course, but any voice on the line would be audible several feet from it. This work, involving much shifting of freight to get his wires out of sight, consumed the night hours, and he ate his breakfast while waiting for the crew to come on duty, so that he might test his installation.

The first call he heard was from the officer of the watch to the engine-room. The engineer was informed that the log showed twenty-three knots, and that the captain had ordered the speed to be increased to twenty-six knots. Crane checked by his watch, counting the pulse of the screw-vibrations, and found that he had estimated the screw-factor rather low. He corrected his chart accordingly. A trip to his lookout station just before dawn had shown him

that the ship was driving ahead into the night with all lights blanketed.

About an hour later there was another call: 'Officer of the watch! Lookout station, sir. I have to report smoke south-south-east.'

'Very well. Report again in fifteen minutes.'

A bell clanged in the engine-room, and the ship slowed down to half-speed. Soon the lookout reported again: 'Steamer south-south-east, hull down as yet; seems to be bearing north-east to cut across our wake.' The speed of the *Cocos* dropped to bare steerage-way, and her course changed to due south-west. Crane determined to have a look outside, and hurried to his ventilator.

It was now full daylight, just on the brink of sunrise. The deckhouse cut off his view to the south-east, and he could not see the strange steamer. There were, however, two new developments in sight. A telescopic steel wireless mast had risen from the deck, and flaunted its aerials high above the smoke-stacks; and in the bow a crew of men were stripping the false deck planking from above a sort of cockpit, in which was mounted a twenty-pounder rapid-fire gun. Some activity of the same sort seemed to be going on in the stern of the vessel, but he could not see clearly. Probably another gun was mounted there.

Three officers stood on the bridge with glasses levelled. Soon one of them climbed the ladder on one of the smoke-stacks, carrying a telescope and a small megaphone. Presently he called down to the bridge, 'The ship is a battle-cruiser, colour dark blue, three funnels and two fighting-tops, forward turrets very high. Looks like the Japanese cruiser *Indumo*.' Then, 'She has sighted us, and is heading this way.'

The captain seized a bell-cord, and immediately the ship gathered headway and slipped into full speed. Crane thought it expedient to get back to his chamber before any one entered the hold.

He just reached his telephone in time to hear a message which the wireless operator was reading to the captain, in which the commander of the *Indumo* ordered him to heave-to at once.

'Ask him by what authority he would halt a neutral vessel on the high seas, engaged in its own business,' said the captain. 'Take all the time you can, while we increase the range.'

The engine-room bell jangled again, and the hum of the engines rose to a still higher note.

A few minutes later came the message, 'Heave-to instantly, or we will fire on you.'

'Very good; no reply,' said the captain of the *Cocos*.

Soon a deep, faint detonation reached Crane, and the voice of the lookout over the 'phone, 'A large shell has burst about half a mile astern. The range seems to be ten or eleven miles.'

Another shot followed, then another, and the lookout reported them as falling about the same place.

'We are out of range of her heaviest guns,' thought Crane; and, in spite of himself, it was with a certain feeling of relief. Then he logged the speed of the vessel, counting the vibrations of the racing screws with difficulty, and was amazed to discover that she was rushing through the water at the rate of some thirty-three knots, or nearly forty miles an hour. He realised that the *Cocos* was beating the cruiser by at least eight miles an hour, and would soon be lost to sight. The 'phone was now useless, for the sharp, whip-like crack of the wireless came from aloft continuously, and Crane guessed that the *Cocos's* captain had ordered his operator to 'break up communication' by sending out into space a meaningless jumble of dots and dashes to prevent the war-ship from calling possible consorts to her help.

No more shots were heard, and Crane napped while the ship sped on into the south-west. He awoke in mid-afternoon, to find that the *Cocos* was swinging a wide circle to the south-east, doubling on her course, and crossing her former track near where the war-vessel had first been sighted, and by three o'clock she had taken up her course north-west again, while the *Indumo* presumably pursued her to the southward of the Hawaiian Islands.

(Continued on page 104.)

THE LOSS OF THE 'QUETTA.'

IN the October part of *Chambers's Journal* for 1915, page 684, a reference is made by the writer of the article 'Freits and Fears' to the tragic shipwreck of the steamship *Quetta*. He adds: 'And not a soul on board of her was ever seen again.' This is far from correct, and we regret having been misled by our contributor. In making the correction, we publish some particulars of the tragedy by a reader of *Chambers's Journal*.

The *Quetta* belonged to the British India

Associated Steamers Company; she was three thousand three hundred tons gross, and valued at seventy-five thousand pounds, and was on her way from Brisbane to London, *via* Torres Strait, that coral-reef-studded piece of water between north-eastern Australia and New Guinea, now officially termed Papua. The steamer, on the night of Friday, 28th February 1890, struck a submerged rock, sixteen or eighteen feet below the surface of the water, near Adolphus Island, Cape York Peninsula, which was un-

charted. The shock was so terrific that one side of the vessel was torn out, and after travelling a short distance she went down in about five minutes. Passengers and crew made up a total of two hundred and seventy-six souls; there were ninety-five passengers, including many well-known citizens of Queensland on their way to London for a holiday. The number saved out of the two hundred and seventy-six was one hundred and seventeen, so that one hundred and fifty-nine went to a watery grave. The commander, Captain Saunders, was amongst the saved.

The *Quetta* was steaming along in bright moonlight when, about half-past eight, she struck the unknown rock, which ripped her whole side open. Nearly all the passengers were on deck enjoying the lovely scenery dimly lit up by the silvery moon, which in those latitudes knows how to shine.

The wreck of the *Quetta* is noteworthy, as it furnishes particulars of the longest swim ever recorded. Among the passengers were two sisters, the Misses Lacey, from Mackay, the chief town in a sugar-growing district on the Queensland coast. One of the sisters was undoubtedly the most interesting figure in the events of that calamitous night.

The following is a statement made by the late Rev. A. M'Laren: 'Then we,' the relief party from Thursday Island, 'steamed toward the Three Brothers Islands, when Captain Reid, with glass in hand scanning the sea in every direction, suddenly saw something not much larger than a coco-nut floating out to sea. He at once steamed toward it, and as we drew nearer he saw that it was a person swimming. Just once a hand was lifted up; but before this a boat was sent out, and a poor young lady was lifted in, but she had in the meantime fainted. I at once recognised her to be Miss May Lacey, sixteen years of age, the eldest daughter of Mr Dyson Lacey, of St Helen's Station, Mackay. She was much exhausted; but, thanks to the care of Dr Salter, she is fast recovering, though she is very weak, and burnt by exposure to the sun. Her story is that she was writing a letter to her mother when the sad event happened, and she rushed to get her younger sister, who had gone to bed, and brought her on deck. Both went over together, and she was afterwards dragged into a boat or raft, where she was very kindly treated by the purser. She remained on the raft till the afternoon, Saturday, when, the purser tells me, she determined to swim to shore, so that she must have been swimming about till she was seen by Captain Reid at 8.10 this morning. Her rescue is almost miraculous, as she was drifting out to sea, away from Mount Adolphus Island, and she could not possibly have held out much longer. Perhaps her rescue and her marvellous self-possession are the most wonderful of all the

melancholy incidents connected with this terribly sad calamity.'

The wreck took place at 8.30 p.m. on the Friday; Miss Lacey was picked up at 8.10 a.m. on the Sunday. One of the rescuing party mentioned that when Miss Lacey was lifted on board her limbs worked automatically as if she were swimming, though she was quite unconscious.

This swimming feat is all the more wonderful considering that Miss Lacey had no belt or support of any kind. She got relief by swimming alternately on her back, breast, and sides. Miss Lacey said that she had no fear of the sharks which infest these tropic seas, but the hot sun scorched her face terribly. Probably the swimmer was asleep part of the time. It is pleasant to know that Miss Lacey quite recovered. She is now married, and living in Tasmania, and has a son in the navy, doing his share in fighting for the Empire.

Referring to long swims, there is, I believe, the record of one of twenty-six hours' duration in the case of a survivor from a wreck; and I know of another, an Australian aborigine, who swam for twenty-four hours after being wrecked in a storm; but Miss Lacey's achievement is likely to hold the record for a lady both for its length and on account of its romantic circumstances.

THE BIVOUAC OF THE DEAD.

On Fame's eternal camping-ground
Their silent tents are spread,
And Glory guards with solemn round
The bivouac of the dead.

Oh, where are they, the gallant band,
Our men who marched away,
With tear-filled eyes on either hand—
None so beloved as they?
Into the vortex they were cast,
Going where duty led,
Facing the foemen's withering blast,
Holding the salient firm and fast;
Victors! but joining at the last
The bivouac of the dead.

No more their names may fill the scroll
Of deeds of daring done,
Nor longer find as days unroll
A place beneath the sun.
In vain for them the trumpet's blare,
In vain the signal's spread;
But yet their 'wireless' nerves to dare,
Heartens their comrades everywhere—
A cloud of witnesses that share
The bivouac of the dead.

And when the day of days doth bring
Back men who marched away,
Who proudly shall salute the King—
Victors enwreathed with bay—
There, all unseen amid the cheers,
Marching with silent tread,
Those others from Elysian spheres,
Unscathed by time, untouched by tears,
Holding throughout the endless years
The bivouac of the dead.

WALTER C. HOWDEN.

Chambers's Journal

SEVENTH SERIES

THE ROMANCE OF A TOKYO CANAL.

By Dr J. INGRAM BRYAN.

THE Romance of the East! How familiar the phrase seems, yet how seldom has any one understood it! There is, indeed, a romance of the East; but it is many-sided and queer, and in the aspect herein set forth somewhat weird. Between the romance of the East and what is romantic to the East there is doubtless a decided difference. It is the latter, however, that more often impresses the perhaps too unromantic traveller. Hence the romance of a Tokyo canal.

The million-peopled streets of Japan's overgrown capital, especially in the lower sections of the city, are threaded here and there by shallow, murky streams that, for want of a more appropriate name, have to be dignified under the appellation of canals; and these winding waterways are crossed by numberless nimble bridges, over which pass even more numberless multitudes from hour to hour; while along their sinuous courses curious boats and barges, propelled by yet stranger human beings, men, women, and children, ply from early dawn till night blots out the scene and brings welcome rest.

This Venice-like region is older than the city—the remains, in fact, of what was once a tiny fishing village before the great Ota Dokwan set up his castle in the vicinity, which showed that the warrior had an eye for sites, as the Tokugawa believed when they selected it as the foundation of the Shogun's capital, since become the metropolis of the nation and the Far East. Now these canals of old Yedo have tales of romance and mystery that are all their own. What tragedies lie buried beneath these turbid waters who can conjure up even by yielding to the wildest flights of fancy? Some of these tragedies have slumbered there in the grimy shallows for many a century, and some are but the episodes of the modern world; yet all lay as hidden secrets till the dredger appeared.

The dredger is a new thing in Tokyo; and when it first began to mope its way along the narrow canals, naturally the bridges and other coigns of vantage became the resorts of hundreds of curious loiterers bent upon witnessing the operations of the foreign device for deepening waterways, but to them a means of learning the secrets of the past. At first no one was pre-

pared to find in these ungainly-looking Western machines anything of romance; but as they began to throw light on many dark things, and open up long-hidden mysteries, the city's multitudes were aroused to interest. For hours people were content to stand on the bridges gazing intently at the rise and fall of the great scoop, especially at its rise, for no one knew what it would bring up next—a crock of gold coin, a skeleton, or the recent remains of some unfortunate pessimist.

Beside the uncouth dredgers were lined up numbers of grimy barges to carry away the mud; and as each scoopful was dumped in, it was expected to reveal something new and strange. If it looked innocent, as it arose above the seething waters, the bargemen with long poles probed it till peradventure something protruded from the stubborn mass; it had to deliver up whatever secret it chanced to hide. The wondrous scoop held the key to the situation, and as it loomed up from under the troubled waters every eye was riveted on it as on an apparition.

Among the more numerous objects brought to light by the Tokyo dredgers were purses; and as they represented all types and times, and were, alas! empty, the absorbing query went its round: 'Why so many empty purses?' No one appeared to know, till a policeman, to whom the question evidently seemed trivial, remarked that thieves and pickpockets usually throw purses into the canal after emptying them, so as to prevent a clue to detection. With this explanation the crowd assumes a knowing look of satisfaction; those that have thus lost purses grow meditative, while some who have been adding their quota to the number thrown in glance about them apprehensively, every one being afraid to slip away lest he be taken for one of the light-fingered gentry.

One day the dredger brought up a number of human skulls; indeed, the spot whence they were scooped seemed as thick with them as shells in an oyster-bed. A bed of skulls! The gaping throng on the bridge assumed an attitude of awe and horror. Who could unravel the mystery? Beside this the purses were nothing. Evidently many a year had passed since the victims had met their fate. Was it that they

had all found an end to hopelessness and misery in the bottom of that slimy flood? Perhaps! Here also the police proved the best interpreters of the romance of the shovel. The skulls, suggested the little man in white, were those of criminals executed in the district long years ago; for there used to be a prison on the banks of that canal, and probably the heads of decapitated criminals were conveniently disposed of by being thrown into it. The poor immolated body could not carry its own head, and so it had to be left behind. If nations could collect all the skulls of those they have killed, no water on earth would be deep enough to hide the gruesome mountain. But they are all hidden away in beds, and the world is satisfied. A bed of skulls, and dumped there by law! The crowd is breathless at the new light on an old mystery; but all is soon forgotten in still more breathless anticipation of the next scoopful. What will this fiendish foreign device bring forth next? These foreign things are the most terrible of investigators. The scoop appears once more above the glassy black surface. What is that round-looking thing? Why, there is a human face on one side of it! The bargeman pokes it out from the suspended scoop, and it drops with a ghastly splash into the bargeful of mud. It is no other than a human head, a mere man's head, the hair cropped and all intact; and it is not very long since the poor fellow lost his head either. Here at last is a mystery which no one ventures to explain, though each has his opinion. The bargeman picks it up. A groan just audible goes up from the spectators, and the foreman gives the word to 'go on.' *Brrrrr—splash!* and the merciless scoop descends again to the infernal regions.

What next? Nothing doing! Several scoops, and still nothing out of the way. The multitude sighs with ennui. The scoop appears again. 'Nothing,' did some one say? What is that rotund protrusion on the far side of the heaped-up mass? The bargeman has seen it from the first. Nothing escapes his practised eye. He gives it a poke. It seems as hard as stone. What can it be? The foreman orders the scoop to remain suspended, and the man prises out the object of interest. It proves to be a piece of crockery, fortunately unbroken—an earthenware pot, and, lo! a cover fitted into it. The lid is forced open. There lie, unawakened from the sleep of centuries, golden coins of the realm current before modern civilisation was born. Whether this find was esteemed of really more interest than the skulls it would be hard to say. The crock of coin is duly noted and handed over to the police as the property of the State.

At a snail's pace the lumbering dredger still makes its way a bit farther up the turbid stream. The new hunting-ground excites deeper interest; and so it goes on through the humid

summer heat each livelong day. Some sections of the way so slowly covered prove much more rich in deposits than others. Always some of the crowd are departing and being replaced by others less pressed for time, errand-boys and shop-boys delivering goods, nurses with babies on their backs, and old men whose daily task is simply to wait. Down goes the scoop again with a whir and a splash. The strong chain grinds on its rusty wheels, slackens, and the cruel scoop opens its wide steel jaws and takes hold with ravenous teeth like some monstrous tiger. The chain tightens; the great jaws come slowly together on some delicious secret of the underworld. Anything this time? Yes, the most remarkable find yet! Up come a man and a woman tied together in the awful grip of the unfeeling scoop. There is a faint burst of astonishment from the crowding spectators. The monotony is broken, and that at least is satisfactory. The bargeman rolls the remains of the unfortunate lovers out of the mud on to the small deck at one end of the barge, under which the bargeman and his family live. Ah! what a tale this find tells let the disappointed lovers of all lands relate. Not so long ago, perhaps the day before, this man and maid were young and fair, revelling in the ecstasy of love's young dream, but the interference of some cruel parent or guardian broke the spell and shut out hope; yet love conquers all things through death, and the black, unsavoury shallows of the canal became to them the way to life.

In a farther section of the ancient canal most of the objects brought to light were old saddles, rusty swords, old-time sabres, military boots, and other martial accoutrements. That a barracks has long occupied the vicinity explained whence these objects came, but not why such things should have been dumped into a canal. Not to shock the reader too greatly, let it be simply stated that one day, when the onlookers were intent, as usual, on the omnivorous scoop, lo! what should it bring up but the body of a girl, the fair young victim demurely seated with folded knees, while the crowd gazed in horror-stricken amazement! Yet why should they have been thus astonished? The only thing new about it was the manner of the discovery. There is hardly a day passes without the body of a young girl being found with life snuffed out in the nation's waters, and no one makes any remark. Such incidents have ceased to be tragic or worthy of surprise.

'What's this?' shouted one bargeman to another as the scoop once more ascended flush with the gunwale of the mud-scow. 'Ah, another baby!' exclaimed his colleague, with little show of either feeling or amazement. 'We got another baby!' said one to the other among the workmen, as though one had been born to them, and they expected congratulations. It was set

aside to await police investigation, and the dredging went on. The next treasure-trove was distinctly more interesting, for it represented not death, but life, and life in its most active form. The dripping water hissed and mud spattered in all directions. Something was flapping and floundering in desperation. It proved to be a

sort of devil-fish, a nameless sort of creature from a foreign point of view, but of great importance, as the boat-hands look to this as a means of reducing their food bills. The foreman soon decided whose turn it was to have the mud-fish, and the dredger went on unravelling the romance of a Tokyo canal.

THE DAY OF WRATH.

CHAPTER VI.—THE FIGHT IN THE MILL.

AS Dalroy burst open the door, which was locked, the heart-rending screams of the three women mingled with the vile oaths of their assailants. He had foreseen that the door would probably be fastened, and put his whole strength into the determination to force the bolt without warning. The scene which met his eyes as he rushed into the room was etched in Rembrandt lights and shadows by a lamp placed in the centre of the table.

Near a staircase—not that which led to the lofts, but the main stairway of the domestic part of the dwelling—Madame Joos was struggling in the grip of the orderly and one of the lieutenants. Another of these heroes—they all belonged to a Westphalian detachment of the commissariat—was endeavouring to overpower Irene. His left arm pinned her left arm to her waist; his right arm had probably missed a similar hold, because the girl's right arm was free. She had seized his wrist, and was striving to ward off a brutal effort to prevent her from shrieking. Busch, that stout satyr, was seated. Dalroy learnt subsequently that the sudden hubbub arose because Irene resisted his attempt to pull her on to his knee. The last of the younger men was clasping Léontine to his breast with rascally intent to squeeze the breath out of her until she was unable to struggle further.

Now Dalroy had to decide in the fifth part of a second whence danger would first come, and begin the attack there. The four officers had laid aside their swords, but the lieutenants had retained belts and revolvers. Busch, as might be expected, was only too pleased to get rid of his equipment. His tunic was unbuttoned, so that he might gorge at ease. Somehow, Dalroy knew that Irene would not free the hand which was now closing on her mouth. The two Walloons carried short forks with four prongs—Joos had taken to heart the Englishman's comment on the disadvantage of a pitchfork for close fighting—and Jan Maertz might be trusted to deal with the ruffian who was nearly strangling Léontine. There remained the gallant lieutenant whose sense of humour permitted the belief that the best way to force onward a terrified elderly woman was to plant a knee against the small of her back. He had looked around at once when the door flew open, and his right hand was

already on the butt of an automatic pistol. Him, therefore, Dalroy bayoneted so effectually that a startled oath changed into a dreadful howl ere the words left his lips. The orderly happened to be nearer than the officer; so, as the bayonet did its work, Dalroy kicked the lout's feet from under him, and thrust him through the body while on the floor. A man who had once won the Dholepur Cup, which is competed for by the most famous pig-stickers in India, knew how to put every ounce of weight behind the keen point of a lance, because an enraged boar is the quickest and most courageous fighter among all the fierce creatures of the jungle. But he was slightly too near his quarry; the bayonet reached the stone floor through the man's body, and snapped at the forte. Then he wheeled, and made for Irene's assailant.

The instant Dalroy appeared at the door the girl had caught the Prussian's thumb in her strong teeth, and not only bit him to the bone, but held on. With a loud bellow of 'Help! Come quickly!' he released her, and struck fiercely with his left hand. Yet this gentle girl, who had never taken part in any more violent struggle than a school romp, had the presence of mind to throw herself backward, and thus discount the blow, while upsetting her adversary's balance. But her clenched teeth did not let go. It came out long afterwards that she was a first-rate gymnast. One day, moved by curiosity on seeing some performance in a circus, she had essayed the stage trick of hanging head downward from a cross-bar, and twirling around another girl's body girdled by a strap working on a swivel attached to a strong pad which she bit resolutely. Then she discovered a scientific fact which very few people are aware of. The jaw is, perhaps, the strongest part of the human frame, and can exercise a power relatively far greater than that of the hands. Of course, she could not have held out for long, but she did thwart and delay the maddened Prussian during two precious seconds. Even when he essayed to choke her, she still contrived to save herself by seizing his free hand.

By that time Dalroy had leaped to the rescue. Shortening the rifle in the way familiar to all who have practised the bayonet exercise, he drove it against the Prussian's neck. The jagged

stump inflicted a wound which looked worse than it was; but the mere shock of the blow robbed the man of his senses, and he fell like a log.

In order to come within striking distance, Dalroy had to jump over Busch. Old Joos, piping in a weird falsetto, had sprung at the fat major and spitted him in the stomach with all four prongs of the fork. Busch toppled over backward with a fearsome howl, the chair breaking under his weight combined with a frantic effort to escape. The miller went with him, and dug the terrible weapon into his soft body as though driving it into a truss of straw. Maertz, a lusty fellow, had made shorter work of his man, because one prong had reached the German's heart, and he was stilled at once. But Joos thrust and thrust again, even using a foot to bury the fork to its shoulder.

This was the most ghastly part of a thrilling episode. Busch writhed on the floor, screaming shrilly for mercy, and striving vainly to stay with his hands the deadly implement from eating into his vitals.

That despairing effort gave the miller a ghouliah satisfaction. 'Aha!' he chortled; 'you laughed at Lafarge! Laugh now, you swine! *That's* for the doctor, and *that's* for my wife, and *that's* for my daughter, and *that's* for me!'

Dalroy did not attempt to stop him. These men must die. They had come to the mill to destroy; it was just retribution that they themselves should be destroyed. His coolness in this crisis was not the least important factor in a situation rife with peril. His method of attack had converted a fight against heavy odds into a speedy and most effectual slaughter. But that was only the beginning. Even while the frenzied yelling of the squirming Busch was subsiding into a frothy gurgle he went to the door and listened. A battery of artillery was passing at a trot, and creating din enough to drown the cries of a hundred Busches.

He looked back over his shoulder. Madame Joos was on her knees, praying. The poor woman had no thought but that her last hour had come. Happily, she was spared the sight of her husband's vengeance. Happily, too, none of the women fainted. Léontine was panting and sobbing in Maertz's arms. Irene, leaning against the wall near the fireplace, was gazing now at Joos, now at the fallen man at her feet, now at Dalroy. But her very soul was on fire. She, too, had yielded to the madness of a life-and-death struggle. Her eyes were dilated. Her bosom rose and fell with laboured breathing. Her teeth were still clenched, her lips parted as though she dreaded to find some loathsome taste on them.

Maertz seemed to have retained his senses, so Dalroy appealed to him. 'Jan,' he said quietly, 'we must go at once. Get your master and the others outside. Then extinguish the lamp. Hurry! We haven't a second to spare.'

Joos heard. Satisfied now that the fork had been effective, he straightened his small body and said shrilly, 'You go, if you like. I'll not leave my money to be burnt with my house.—Now, wife, stir yourself. Where's that key?'

The familiar voice roused Madame Joos from a stupor of fear. She fumbled in her bodice, and produced a key attached to a chain of fine silver. Her husband mounted nimbly on a chair, ran a finger along one of the heavy beams which roofed the kitchen, found a cunningly hidden keyhole, and unlocked a long, narrow receptacle which had been scooped out of the wood. A more ingenious, accessible, yet unlikely hiding-place for treasure could not readily be imagined. He took out a considerable sum of money in notes, gold, and silver. Though a man of wealth, with a substantial account in the State bank, he still retained the peasant's love of a personal hoard.

Stowing away the money in various pockets, Joos got down off the chair. Busch was dying, but he was not unconscious. He had even watched the miller's actions with a certain detached curiosity, and the old fellow seemed to become aware of the fact. 'So,' he cackled, 'you saw, did you? That should annoy you in your last hour, you fat thief!—Yes, yes, monsieur, I'll come now.—Léontine, stop blubbing, and tie up that piece of beef and some bread in a napkin. We fighting-men must eat.—Jan, put the bottles of champagne and the pork-pie in a basket.—Léontine, run and get your own and your mother's best shoes. You can change them in the wood.'

'What wood?' put in Maertz.

'We can't walk to Maestricht by the main road, you fool.'

'That's all right for you and madame here, and for Léontine, perhaps. But I remain in Belgium. My friends are fighting yonder at Liège, and I'm going to join them. And these others mustn't try it. The frontier is closed for them. I was offered my life only two hours ago if I arrested them.'

'Jan!' cried Léontine indignantly.

'It's true. Why should I tell a lie? I didn't understand then the sort of game the Prussians are playing. Now that I know'—

'Miss Beresford,' broke in Dalroy emphatically, 'if these good people will not escape when they may, we must leave them to their fate.'

'Do come, Monsieur Joos!' said Irene, speaking for the first time since the tragedy. 'By remaining here you risk your life to no purpose.'

'We are coming now, ma'm'selle.'

Suddenly the miller's alert eye was caught by a spasmodic movement in the limbs of the last man whom Dalroy struck down. '*Tiens!*' he cried; 'that fellow isn't finished with yet.'

He was making for the prostrate form with that terrible fork, when Dalroy ran swiftly and collared him. 'Stop that!' came the angry

command. 'A fair fight must not degenerate into murder. Out you get now, or I'll throw you out!'

Joos laughed. 'You're making a mistake, monsieur,' he said. 'These Prussians don't fight that way. They'd kill you just for the fun of the thing if you were tied hand and foot. But let the rascal live if it pleases you. As for this one'—and he spurned Busch's body with his foot—'he's done. Did you hear him? He squealed like a pig.'

Dalroy was profoundly relieved when the automatic pistols and ammunition were collected, the lamp extinguished, the door closed, and the whole party had passed through a garden and orchard to the gloom of the ravine. The hour was about half-past eight o'clock. Twenty-four hours earlier he and Irene were about to leave Cologne by train, believing with some degree of confidence that they might be allowed to cross the frontier without let or hindrance! Life was then conventional, with a spice of danger. Now it had descended in the social scale until they ranked on a par with the dog that had gone mad and must be slain at sight. The German code of war is a legal paraphrase of the trickster's formula, 'Heads I win, tails you lose.' The armies of the Fatherland are ordered to practise 'frightfulness,' and so terrorise the civil population that the inhabitants of the stricken country will compel their rulers to sue for peace on any terms. But woe to that same civil population if some small section of its members resists or avenges any act of 'frightfulness'! Soldiers might murder the Widow Jacquinet and ravish her granddaughter; officers might plan a bestial orgy in the miller's house; but Dalroy and Joos and Maertz, in punishing the one set of crimes and preventing another, had placed themselves outside the law. Neither Joos nor Maertz cared a farthing rush-light about the moral consequences of that deadly struggle in the kitchen, but Dalroy was in different case. He knew the certain outcome. Small wonder if his heart was heavy and his brow seamed. His own fate was of slight concern, since he had ceased to regard life as worth more than an hour's purchase at any time from the moment he leaped down into the station-yard at Aix-la-Chapelle. But it was hard luck that the accident of mere association should have bound up Irene Beresford's fortunes so irrevocably with his. Was there no way out of the maze in which they were wandering? What, for instance, had Jan Maertz meant by his cryptic statements?

'We must halt here,' Dalroy said authoritatively, stopping short in the shadow of a small clump of trees on the edge of the ravine, a place whence there was a fair field of view, yet so close to dense brushwood that the best of cover was available instantly if needed.

'Why?' demanded Joos. 'I know every inch of the way.'

'I want to question Maertz,' said Dalroy shortly. 'But don't let me delay you on that account. Indeed, I advise you to go ahead, and safeguard Madame Joos and your daughter. I would even persuade, if I can, Mademoiselle Beresford to go with you.'

'I don't mind listening to Jan's yarn myself,' grunted the miller. 'And isn't it time we had some supper? Killing Prussians is hungry work. Did you hear Busch? He squealed like a pig.—Léontine, cut some chunks of beef and bread, and open one of these bottles of wine.'

There was solid sense in the old man's crude rejoinder. Criminals about to suffer the death penalty often enjoy a good meal. These six people, who had just escaped death, or—where the women were concerned—a degradation worse than death, and before whose feet the grave might yawn wide and deep at once and without warning, were nevertheless greatly in want of food. So they ate as they talked.

Maertz's story was coherent enough when set forth in detail. He was dazed and shaken by the fall from the wagon; but, helped by the sentry, who bore witness that the collision was no fault of his, being the outcome of obedience to the officer's order, he contrived to calm the startled horses. The officer even offered to find a few men later who would help to pull the wagon out of the ditch; so Jan was told to 'stand by' until the column had passed. Meaning no harm, he asked what had become of his passengers. This naturally evoked other questions, and a search was made, with the result that the lamp and Dalroy's discarded sabots were found. The lamp, of course, was numbered, and carried the initials of a German State railway; but this 'exhibit' only bore out Maertz's statement that a man from Aix had come in the wagon to explain to Joos why the consignment of oats had been so long held up in the goods-yard.

In fact, a squad of soldiers had put the wagon right, and were reloading it, when the bodies of Heinrich and his companion were discovered in the stable. Suspicion fell at once on the missing pair. Maertz would have been shot out of hand if an infuriated officer had not recollected that by killing the Walloon he would probably destroy all chance of tracing the man who had 'murdered' two of his warriors. So Maertz was arrested, and dumped into a cellar until such time as a patrol could take him to Visé and investigate matters there.

Meanwhile the unforeseen resistance offered to the invaders along the line of the Meuse and in the neighbourhood of Liège was throwing the German military machine out of gear. In this initial stage of the campaign 'the best-organised army in the world' was like a powerful locomotive engine fitted with every mechanical device for rapid advance, but devoid of either brakes or reversing-gear. As the 7th and 10th Divisions recoiled from the forts of Liège in something

akin to disastrous defeat, congestion and confusion spread backward to the advanced base at Aix. Hospital trains from the front compelled other trains laden with reserves and munitions to remain in sidings. The roads became blocked. Brigades of infantry and cavalry, long lines of guns and wagons, were halted during many hours. Frantic staff officers in powerful cars were alternately urging columns to advance and demanding a clear passage to the rear and the headquarters staff. No regimental commandant dared think and act for himself. He was merely a cog in the machine, and the machine had broken down. Actually the defenders of Liège held up the Kaiser's legions only a few days, but it is no figure of speech to say that when General Leman dropped, stupefied by an explosion in Fort Loncin, he had established a double claim to immortality. Not only had he shattered the proud German legend of invincibility in the field, but he had also struck a deadly blow at German strategy. With Liège and Leman out of the way, it would seem to the student of war that the invaders must have reached Paris early in September. They made tremendous strides later in the effort to maintain their 'time-table,' but they could never overtake the days lost in the valley of the Meuse.

What a tiny pawn was Jan Maertz in this game of giants! How little could he realise that his very existence depended on the shock of opposing empires!

The communications officer at the cross-roads had not a moment to spare for many an hour after Jan's execution was deferred. At last, about nightfall, when the 9th Division got into motion again, he snatched a slight breathing-space. Remembering the prisoner, he detailed a corporal and four men to march him to Visé and make the necessary inquiries at Joos's mill.

For Maertz's benefit he gave the corporal precise instructions. 'If this fellow's story is proved true, and you find the man and the woman he says he brought from Aachen, return here with the three of them, and full investigation will be made. If no such man and woman have arrived at the mill, and the prisoner is shown to be a liar, shoot him out of hand.'

A young staff officer, a lieutenant of the Guards, stretching his legs while his chauffeur was refilling the petrol-tank, overheard the loud-voiced order, and took a sudden and keen interest in the proceedings.

'One moment,' he said imperatively. 'What's this about a man and a woman brought from Aachen? Who brought them? And when?'

The other explained, laying stress, of course, on the fractured skulls of two of his best men.

'Hi, you!' cried the Guardsman to Maertz; 'describe these two.'

Maertz did his best. Dalroy, to him, was literally a railway employé; but his recollection of Irene's appearance was fairly exact. More-

over, he was quite reasonably irritated and alarmed by the trouble they had caused. Then the lamp and sabots were produced, and the questioner swore mightily.

'Leave this matter entirely in my hands,' he advised his confrère. 'It is most important that these people should be captured, and this is the very fellow to do it. I'll promise him his life, and the safety of his friends, and pay him well into the bargain, if he helps me to get hold of that precious pair. You see, we shall have no difficulty in catching and identifying him again if need be. Personally, I believe he is telling the absolute truth, and is no more responsible for the killing of your men than you are.'

Lieutenant Karl von Halwig's comparison erred only in its sheer inadequacy. The communications officer's responsibility was great. He had failed to control his men. He was blind and deaf to their excesses. What matter how they treated the wretched Belgians if the road was kept clear? It was nothing to him that an old woman should be murdered and a girl outraged so long as he kept his squad intact.

'So now you know all about it, monsieur,' concluded Maertz. 'When I met you in the ravine I thought you were escaping, and let out at you. God be praised, you got the better of me!'

'Was the staff officer's name Von Halwig?' inquired Dalroy.

'Name of a pipe, that's it, monsieur! I heard him tell it to the other pig, but couldn't recall it.'

'And when were you to meet him?'

'He had to report to some general at Argenteau, but reckoned to reach the mill about nine o'clock.'

'Oh, father dear, let us all be going!' pleaded Léontine.

'One more word, and I have finished,' put in Dalroy. He turned again to Maertz. 'What did you mean by saying a little while ago that the frontier is closed?'

'The lieutenant—Von Halwig, is it?—sent some Uhlans to the major of a regiment guarding the line opposite Holland. He wrote a message, but I know what was in it, because he told the other officer. "They're making for the frontier," he said, "and if they haven't slipped through already, we'll catch them now without fail. They mustn't get away this time, if we have to arrest and examine every — Belgian in this part of the country."'

'Ho! ho!' piped Joos, who had listened intently to Jan's recital. 'Why didn't you tell us that sooner, animal? What chance, then, have I and madame and Léontine of dodging the rascals?'

'Caput!' cried Maertz, scratching his head; 'that settles it! I never thought of that!'

'Oh, look!' whispered Léontine. 'They're searching the mill!'

So earnest and vital was the talk that none of the others had chanced to look down the ravine. They saw now that lights were moving in the upper rooms of the mill. Either Von Halwig had arrived before time, or some messenger had tried to find the commissariat officers, and had raised an alarm.

Joos took charge straight away, like the masterful old fellow that he was. 'This locality isn't good for our health,' he said. 'The night is young yet, but we must leg it to a safer place before we begin planning. Leave nothing behind. We may need all that food.—Come, Lise,' and he grabbed his wife's arm, 'you and I will lead the way to the Argenteau wood. The Devil himself can't track me once I get there.—Trust me, monsieur, I'll pull you through. That lout, Jan Maertz, is all muscle and no brain. What Léontine sees in him I can't guess.'

For the time being, Dalroy believed that the miller might prove a resourceful guide. Before deciding the course he personally would pursue it was absolutely essential that he should learn the lie of the land and weigh the probabilities of success or failure attached to such alternatives as were suggested.

'We had better go with our friends,' he said to Irene. 'They know the country, and I must have time for consideration before striking out a line of my own.'

'I think it would be fatal to separate,' she agreed. 'When all is said and done, what can they hope to accomplish without your help?'

Joos's voice came to them in eager, if subdued, accents. He was telling his wife how accounts were squared with Busch. 'I stuck him with the fork,' he chortled, 'and he squealed like a pig!'

(Continued on page 114.)

THE FOREST AWAKES.

By F. G. AFLALO.

WE went to the forest at dead of night. It lies in the government of Novgorod, rather more than a hundred miles out of St Petersburg, on the new line to Vologda and Archangel, and we were the whole night on the journey, for trains do not hustle unduly in the Russian Empire, and there were, besides, several miles through the snow on foot, in springless country carts, and even on an open ferry across a wide river just making up its mind to freeze. Oh those springless carts! The *tarantass* is also springless, but is at any rate slung on a pole, with a swaying movement not far from soothing on a good road or over snow; but in the jolting of the country cart there is no comfort, whether the hardy little pony is plodding over apologies for roads or crashing through thin ice, or stumbling amid the trees on the outskirts of the forest. Yet the memory of daybreak in that silent wood, with its white carpet and its slender frosted pinnacles of fir and birch, is so enthralling as of itself to have been worth the discomfort of the journey; and well it needed such solace, for the blackcock, which should have flown obediently to the decoys silhouetted in the tree-tops against the growing light of that November dawn, stayed away, with the result that not a cartridge was fired by any of the party. The two innocent-looking wigwags of boughs hid the four of us. In one crouched the Japanese Ambassador, Baron Motono, and the Russian representative of the best-known newspaper in the whole world; and the other I shared with the first secretary of the Swedish Embassy, a curiously international quartette of guns willing to wound, yet with no opportunity of striking. With as little disturbance as possible we had crept over the hard snow to our hiding-places, and there we were built in by the keepers, who then

fastened excellent imitations of blackcock and gray hen to slender poles and fixed these close to fir-trees. Then the keepers beat up the cover; but snow was falling, a keen wind was rustling the branches, and the birds would not move.

It may sound a heresy, but I was almost glad. There was something so wonderful in the witchery of that gradual illumination of the forest, home of elk, bear, wolf, lynx, fox, capercaillie, and other game; something so compelling in the silence, broken only by the faint chirruping of little birds awaking to another short winter day, that the sound of firearms would have broken the spell, and the murder that was in our hearts would have been unutterable profanity. Let me not even seem to pretend that the business of the moment was out of my thoughts. Given the chance, I should have held my gun as straight as possible in that deceptive twilight, but I vow I was not wholly sorry that the chance should be withheld. There is always a holy mystery about the dawn, particularly at sea or in the forest. At sea there is the wonder of seeing the light spread of a sudden out of the east, as it were overflowing the rim of a chalice, until the great waters, so dreadful in the darkness of night, glow in a moment with not unfriendly smiles of welcome. In the forest the beauty of daybreak lies rather in its association with the movement of living things; of shrinking plants that, once night is past, open to the kiss of the sun; of small birds that give their feathers a shake and sing out of the joy of their hearts; and, on the other hand, of suspicious creatures of the night that must, with the first shafts of light, get back into hiding.

This special forest in Novgorod is a couple of hundred thousand acres in extent, and the

shooting rights are in the hands of a small international club. The recent opening of a railway line brought, particularly during construction, the inevitable accession of poachers; but, thanks to influence in the right quarters, the house is being set in order, and in a year or two some wonderful bags should be made. Even now the wolves and foxes are so numerous that, in order to buy exemption for the hares, it is found necessary to dole out stronger meat in the shape of dead horses.

Sport on this occasion was, as has been said, utterly wanting. Yet I saw nothing amiss in having travelled a couple of hundred miles, out and back, some of the distance in comfortless fashion, for I had sensed the curious magic of the gigantic Russian forest as it stretches its limbs at daybreak. Something of the same transformation is witnessed by sportsmen in India, who sit through the night in their *machan*. Yet I think that the glamour of the Northern woods is unique.

SINGLE-HANDED.

CHAPTER III.

AS Crane attended to his rough chart, and snatched a bite of food, his mind was running on a matter that had been present as an undercurrent in his thoughts ever since he came aboard, but which the pressure of events had hitherto kept in the background. The sight of that twenty-pounder rapid-fire gun had brought it to the fore. This was the question of the contents of these long, iron-strapped boxes. In looking over the freight he had noted a pile of small square cases near his chamber that were bound with similar iron bands, but had not had time to look into them. He did not dare to work outside just now; but the long boxes were near at hand; they formed the roof over his head, though three of them were piled in the outside tier of freight forward. Getting out his tool-kit, he began to investigate the box just over his head. First he bored four holes in a square, some eight inches apart; then with a narrow saw, and with little more noise than the gnawing of a rat, he began to cut out the section of board. The tough wood took time and patience, but it yielded at last, and the little square dropped out. He pulled away a thick layer of packing until he reached a hard surface. His exploring fingers told him that this was a smooth cylinder, about a foot in diameter, like a column, but not terra-cotta. The light of his lantern flashed into the opening. The cylinder was made of steel, and his mind flashed as quickly to the probable explanation. This steel cylinder was a torpedo capable of sending to the bottom the heaviest battleship afloat. The smaller boxes must contain shells for quick-firing guns. The purpose of this voyage to Salina Cruz must have been to receive this consignment of ammunition, and to transport it to the war-vessel that had been preying on the shipping of the Allies in these waters. She might be a powerful sea-going submarine, making her base at some unfrequented island in mid-Pacific.

It was with the liveliest emotions that Crane realised that he had made his home in the heart of a magazine of high explosives, which, should it happen to be set off by accident or by a hostile

shot, would scatter the ship like scum over the face of the water. But this thought did not occupy him long. There was a fatalistic streak in his make-up, a bulldog determination to 'hew to the line, let the chips fall where they may,' that had got him into trouble several times during his life, but had straightway got him out again. For the present, at least, he put personal considerations aside; his whole business was to 'do his durnedest,' as the cow-boys have it, and watch the future with a steady nerve and a clear mind. His greatest interest was centred on seeing the ship that was to use these torpedoes. He was destined to see her sooner than he expected.

About five o'clock that afternoon, as he lay listening to the routine calls over the 'phone, the voice of the lookout sounded, calling to the officer on the bridge. 'Smoke over the starboard bow,' he reported. The speed of the vessel slackened. At short intervals the lookout reported, and Crane gleaned the information that a large freighter of about five thousand tons burden, with two funnels, buff in colour, and flying the British flag, was crossing the bows some four miles ahead. The *Cocos* kept to her course; the British freighter ploughed on into the south-west, bound probably from San Francisco to Sydney by the Samoan route. Darkness came on, and Crane awoke from a doze—for his rest had been broken by the warship's chase—to note that his compass was acting strangely. The ship was evidently circling southward again; soon she straightened out on a due south course at increased speed. Nothing came over the 'phone save routine orders for running the ship, so after an hour or so he decided to slip up to his lookout station and reconnoitre.

He looked out on a deck that was almost dark. Two shaded lights were directed on the rapid-fire gun in the bow, which a crew of men were busily preparing for action. He was certain that the *Cocos* was following the British freighter; but what for? Surely she did not intend to attack that massive vessel with this little gun and her small crew. Many merchant-vessels themselves mounted a light gun or two in these

troublesome times. Such an attack might succeed ; but it would be a desperate hazard, and did not harmonise with the methodical and scientific methods of the men he was watching.

Suddenly he felt the *Cocos* make an abrupt change in her course, and the lights of the freighter hove in sight over the larboard bow. Running two knots to her one, the *Cocos* overhauled her rapidly and silently.

A file of men came across the deck, raised the hatch-cover, and dropped into the hold. Crane dropped as quickly from his ventilator, but there was no time to regain his enclosed chamber. He had perforce to remain in his original hiding-place on top of the freight. He had taken the precaution to place some boxes so as to screen him from observation by any one forward ; also he had carefully broken the filament in the nearest electric-light globe. This had not been noticed, and it left the corner quite gloomy. He was therefore free to move about in comparative safety.

Through a small crevice he commanded a view of the open space forward and the hatchway ladder, as the men filed down. One of them stepped to a corner, lifted a board in the floor, seized a long lever, and raised it upward. Instantly two of the large steel plates on the forward bulkhead separated, rolled apart, and left a wide-open doorway. Through this could be seen a triangular room, reaching forward into the prow, and brilliantly lighted. In the centre of the room sat a glittering steel monster like a huge gun. Crane recognised it instantly as a torpedo-tube of the latest type, not fixed in position like the older tubes, but working on a semicircular track, and capable of direction like a coast-defence mortar. He at once realised the meaning of the whole manœuvre. These fiends meant to slip up beside the huge freighter ploughing her peaceful way southward with her sleeping crew, and let loose upon her one of the hideous devil-fish from the long boxes. Suddenly, without warning, all these inoffensive, unsuspecting fellows would be hurled to a horrible death through no fault of their own. His blood ran cold ; then it boiled up, and a red mist sprang before his eyes. He grasped the handle of his revolver, and his muscles strained for a leap to the floor. He would get some of these devils, anyhow.

But just in time the cold hand of reason touched his brow, and chilled the unruly surge of passion. Of what avail would be the sacrifice ? He might kill two or three, possibly four, of the crew below. The rest would kill him, then calmly step over the bodies and complete their task. He could not save the British ship now ; but with his present knowledge he might save many others by keeping his head and watching his opportunity. The *Cocos*, with her tremendous speed, could laugh at the combined navies of England and Japan, and, so long as she was not known to be the perpetrator

of these outrages, could operate indefinitely. His plain duty was in the higher sphere—to withhold action now, and devote his whole energy, and his life if need be, to some plan to end the career of this destructive masquerader.

Meanwhile he watched with intense interest the actions of the crew before him. They stepped into their positions and prepared the tube for action with the quickness and certainty of long practice. The deadly missile was already in place ; he knew now when it was put there. In a few minutes the lights were snapped off, except a small bulb which barely illuminated the sighting mechanism. Then a panel slid back, and a large porthole opened in the larboard bow. Crane could not see the doomed freighter, but he could see the reflection of her lights on the water. There were a few low orders, a clicking of machinery, and then a sudden hiss of escaping air as a long black shadow shot through the open porthole. Regardless of danger, Crane leaped up and scrambled into his ventilator.

The night was black, the sky overcast. Hardly a thousand yards away, and slightly in advance, the British vessel glided along, her bulk pricked out by occasional lights. She seemed not to realise the *Cocos's* presence. Everything was calm and quiet ; his senses refused to realise the meaning of that sinister black shape slipping so silently through the black water. A few moments thus, and then a red glare showed at the freighter's water-line and flamed upward, setting out every detail of the scene like a photographer's flashlight. He saw the big freighter heel over ; a quarter of her port-side disappeared, showing her interior structure like a house struck by a cyclone. The glare died down ; then a second explosion came as the water reached her boilers, and a shower of embers from her furnaces flew out and hissed into the sea. A muffled roar filled his ears, and a sharp blast of air struck his face, and the *Cocos* rocked and tossed in the waves.

All was dark now ; only a black bulk showed where the freighter lay—a black bulk that settled slowly, slowly lower. A jumble of minor sounds came across to him, small explosions, screams, shouts, commands. The black bulk heaved once endwise, settled back gently, and disappeared. For a few moments there was silence.

Then, like the crack of a whip, the *Cocos's* searchlight leaped across the waters and played upon the spot. A little wreckage floated—surprisingly little. A few men clung to boxes or planks, and one small boat, with about a dozen occupants, rowed toward them. The *Cocos* was swinging in closer, and Crane expected to see a boat manned for the rescue. Then he heard a crisp order forward, and saw the crew of the quick-firer leap to stations. The gun swung round ; three sharp explosions rent the air in rapid succession. Three more explosions echoed

back as the shells reached their mark, and the small boat crumpled like an egg-shell. Once more the searchlight swept the scene, then flickered out; the hum of the engines quickened, and the nose of the ship swung away to the west.

Sick at heart, sick in mind and body, Crane crept down from the lookout, and lay almost listlessly watching the German crew as they opened the nearest box and fitted another torpedo into the tube. For the first time he realised the capabilities of the literal, scientific Teutonic mind. The men before him did not look cruel or brutal. They were simply carrying out a plan to its logical conclusion. Their operations could be carried on only by absolute secrecy. They could not burden themselves with prisoners. They knew before they attacked that the crew of the freighter must die. The destruction of the

few miserable, helpless survivors was, to them, not murder, but a simple military measure. They must not be left to be picked up and to spread their story. It was no worse than dropping bombs from aircraft on sleeping cities, or shelling towns filled with non-combatants, both common events in the present war. Nevertheless his flesh crept and his fingers closed convulsively on the handle of his heavy Leuger.

Presently the torpedo-crew finished their work, the panels were shut, and they filed out through the hatchway. Crane lay thinking for an hour or more as the ship settled into quiet. A plan was taking shape in his mind, and he wished to work it out to the last detail. When midnight came, he roused himself and climbed down to the floor. The time for work had come.

(Continued on page 119.)

OLD SCOTTISH SAYINGS

AS TO LOCALITIES, ANIMALS, WEATHER, &c.

By JAMES FERGUSON, K.C.

THE descriptive sayings of Scotland, other than those which have a prophetic form or relate to historical episodes or family characteristics, are often quaint and picturesque. They contain much local wisdom, they photograph for us the special features of different districts or of natural objects such as rivers and mountains, and they often enshrine traditional lore, curious superstitions, and romantic legends. They epitomise the results of much observation of natural phenomena, of weather conditions, and shrewd judgments of agricultural land. Thus the comparative values of different regions are succinctly summarised in:

A lairdship in the Links o' Forth
Is worth an earldom in the North;

and

Ae rood o' Don's worth twa o' Dee,
Except it be for fish and tree;

otherwise given as

The river Dee for fish and tree,
The river Don for horn and corn;

or

Ae mile o' Don's worth twa o' Dee,
Except for salmon, stane, and tree;

or thus expanded:

Don and Deveron for grass and corn,
Spey and Dee for fish and tree.

The good fortune of the Highland Frasers in their territory is noted in the Gaelic observation:

Great is the profit of the Aird to MacShimei;
while the bareness of the Border uplands is indicated in:

Had heather bells been corn o' the best,
Buccleuch had had a noble grist.

A Strathspey rhyme runs:

Dipple, Dundurcas, Dandaleith, and Dalvey
Are the four bonniest haughs on the banks o' the Spey.

The searching breezes of the north-east and the changes of ownership of a Banffshire lairdship are epitomised in:

Cauld blaws the wind
About the house o' Eden,

and

Cauld Carnousie stands on a hill,
An' mony a fremit ane gangs theretill.

The varied interests of Forfarshire are summarised in the Arbroath weavers' toast:

The life o' man, the death o' fish,
The shuttle, soil, an' plough,
Corn, horn, linen, yarn,
Lint an' tarry woo;

while the number of small estates in Fife is alluded to in the definition:

A Fife laird—a wee pickle land, gey muckle debt,
and a doocot.

The perils of a low-lying coast are recorded in:

'Tween the Isle o' May
An' the Links o' Tay,
Mony a ship's been cast away;

while before the days of lighthouses sailing directions were provided for those navigating along the sandy shore, with its dangerous reefs, between Peterhead and Fraserburgh:

Keep Mormond Hill a handspike high,
And Ratray Briggs ye'll no' come nigh;

and a guide to those making the port of Aberdeen:

Clochnaben and Benachie
Are twa landmarks aff at sea.

A rhyme of the south-eastern shores commemorates the situation of three old churches :

St Abb, St Helen, and St Bey,
They a' built kirks to be nearest the sea;
St Abb's upon the nabbs,
St Helen's on the lea,
St Bey's upon Dunbar sands
Stands nearest to the sea.

The rhymes about rivers are numerous, and illustrate the varied character of our Scottish streams. The sinuous course of one northern river makes emphatic the Aberdeenshire comment on a double-dealing man :

He has as many crooks as Don.

Many of the lines are of grim significance :

Tweed said to Till,
'What gars ye rin sae still?'
Till said to Tweed,
'Though ye rin wi' speid,
An' I rin slaw,
Yet where ye droon ae man
I droon twa.'

Was ne'er ane drooned in Tarras,
Nor yet in doubt;
For ere the head wins down
The harns are oot.

Of a sluggish Forfarshire stream the rhyme runs :

Dowie, dowie Dean,
Ilka year gets ane;

and the characteristic of the northern Avon is indicated in :

The water o' A'an it rins sae clear,
'Twould beguile a man o' a hundred year.

An old rhyme relating to a quiet agricultural district in Buchan says :

Ugie said to Ugie,
Where shall we twa meet?
Doon in the haughs o' Rora,
Where a' men are asleep;

and a Lowland version of the Gaelic prophecy,

Great Tay of the waves
Shall sweep Perth bare,

indicates the same fate in terms of significant obliquity, referring to two tributary streams :

Says the Shochie to the Ordie;
'Where shall we meet?'
'At the Cross o' Perth
When a' men are fast asleep.'

The close proximity of the sources of rivers running in different directions and their different courses are described in :

Annan, Tweed, and Clyde
Ran a' oot o' ae hillside;
Tweed ran, Annan wan,
Clyde fell an' brak its back owre Corra Linn.

A Forfarshire rhyme runs :

Prosen, Esk, and Carity
Meet at the birken buss o' Inverquharity;

and a Peeblesshire one referring to a well on a hill near Eddleston, said to rise from an underground reservoir, says :

Powbate, an' ye break,
Tak' the Moorfoot in yer gate,
Moorfoot an' Mauldsalie,
Huntlycote, a' three,
Five kirks an' an abbacie.

Those relating to mountains are not so numerous, and often deal with them as barometrical indicators. The three Galloway hills of the same name are distinguished as

Cairnsmuir o' Fleet,
Cairnsmuir o' Dee,
And Cairnsmuir o' Carsphairn,
The biggest o' the three.

A quaint tradition in regard to Tinto, in Lanarkshire, is embodied in :

On Tintock tap there is a mist,
And in that mist there is a kist,
And in the kist there is a caup,
And in the caup there is a drap;
Tak' up the caup, drink aff the drap,
And set the caup on Tintock tap.

Several districts have their own sayings relating to weather connected with prominent hills. Thus Aberdeenshire :

When Benachie puts on its tap
The Garioch lads will get a drap.

Fife, referring to the summits of the Lomonds :

When Falkland Hill puts on its cap
The Howe o' Fife will get a drap;
And when the Bishop draws his cowl
Look out for wind and weather foul.

The Borders :

When Ruberslaw puts on his cowl,
The Dunion on his hood,
Then a' the wives o' Teviotdale,
Ken there will be a flood.

Dumfriesshire : a saying used to point a political moral at the time of the Union :

If Skiddaw has a cap
Criffel wots full weel o' that.

Central Scotland :

When the Castle o' Stirling gets a hat,
The Carse o' Corntoun pays for that.

And Haddingtonshire :

When Traprain Law puts on his hat,
The Lothian lads may look to that.

The general distiches as to weather are curiously borne out by repeated experience. The first of the three spring storms, known in the North as the 'Borrowing Days,' the 'Teuchit's Storm,' and the 'Gab of May,' is commemorated in :

March said to Aperill,
I saw three hogs on yonder hill,
An' if you'll lend me dayis three
I'll find a way to gar them dee.
The first o' them was wind an' weet,
The neist o' them was snaw an' sleet,
The third o' them was sic a freeze
It friz the birds' nebs till the trees;
An' when the three days were past an' gane,
The silly poor hoggies cam' hirplin' hame.

The shepherd's saying was :

Leap year
Was ne'er a good sheep year.

Other weather-wise rhymes run :

A' the months o' the year,
Curse a fair Februeer.

If Candlemas day be dry an' fair,
The half o' winter's to come an' mair;
If Candlemas day be wet an' foul,
The half o' winter's gane at Yule.

A warm May and a weeping June
Bring the hairst richt sune.

St Swithin's day, gin ye do rain,
For forty days it will remain;
St Swithin's day, an ye be fair,
For forty days 'twill rain nae mair.

As lang's the bird sings afore Candlemas he greets
after it.

A Merse mist along the Tweed
Is a harvest morning's gude indeed.

A misty May and a dripping June
Brings the bonny land o' Moray abune.

Moray has fifteen days more summer than its
neighbour.

To this a contrast is afforded by the Aberdeen-
shire saying referring to a herculean task or
attempting the impossible :

As well try to stop the north wind blowing through
the glens o' Foudland ;

which recalls the new petition added by John,
Earl of Kintyre, to his prayers :

Lord keep the hill o' Foudland between me and
Duff o' Braco.

Another Aberdeenshire saying, referring to the
third Thursday in February, is :

The Fair-day o' Auld Deer
Is the warst day in a' the year ;

but a more cheerful Gaelic one declares that

Frosty winter, misty spring, chequered summer,
and sunny autumn never left dearth in Scotland.

Much wisdom and some superstition are also
found in couplets or sayings about animals, birds,
and trees. Generally correct in its application
to the earlier-mentioned beings, and in accord-
ance with traditions about famous stags, is the
Highland one :

Thrice the age of the dog is the age of the horse,
Thrice the age of the horse is the age of a man,
Thrice the age of a man is the age of the deer,
Thrice the age of the deer is the age of the eagle,
Thrice the age of an eagle is the age of the oak-
tree.

Some versions, it is understood, interpose the
raven before or after the eagle.

The pyet or magpie has always been a favourite
bird of augury :

Twa's joy, three's grief,
Four's a wedding, five's a birth.

And there is a subtle charm in the lines :

Gang and hear the gowk yell,
Sit and see the swallows flee,
See the foal before its mother's e'e,
'Twill be a prosperous year to thee.

Among our native trees the rowan has always
been believed to possess a peculiar potency. An
Aberdeenshire rhyme says :

Rowan-tree and red woodbine
Will haud the witches' oncomin'.

A more southern one runs :

Black cogie, lammer bead,
Rowan-tree, an' red thread,
Put the witches to their speed ;

or

Gar the witches dance to deid.

The maiden's test of her demon lover, who
appeared in the guise of a handsome young man,
was :

Gin ye wish to be leman mine,
Lay off the St John's wort an' the vervine.

Superstitions were also associated with colours,
more particularly with yellow, still the flag of
quarantine and plague; and green, fatal to
the Lindsays since the battle of Brechin, to the
Sinclairs since that of Flodden, and to the
Grahams :

Blue is beauty, reid's a taiken,
Yellow's grief, an' green's forsaken.

The march to Flodden is also responsible for
the tradition that it is fatal to a Sinclair to cross
the Ord of Caithness on a Monday ; but a record
of brighter change of fortune is preserved in
that which prevents any Bruce killing a spider.

A Forfarshire rhyme preserves the designations
of four branches of an ancient house :

Guthrie o' Guthrie,
Guthrie o' Gagie,
Guthrie o' Taybank,
An' Guthrie o' Craigie.

And the hard fortune of a supernatural being
impressed into the service of Graham of Morphie
is recorded in his metrical soliloquy :

Sair back an' sair banes,
Driving the Laird o' Morphie's stanes.
The Laird o' Morphie'll never thrive
As lang's the kelpy is alive.

Local peculiarities or incidents are also hit
off in a few graphic, but not very complimentary,
rhymes. A village on the north of the Ochils
is commiserated thus :

The lasses o' Exmagirdle
May very weel be dun,
For frae Michaelmas till Whitsunday
They never see the sun.

Another Perthshire rhyme runs :

Was there e'er sic a parish, a parish, a parish,
Was there e'er sic a parish as Little Dunkeld ?
They ha'e stickit the minister, hanged the pre-
centor,
Dung doon the steeple, an' drucken the bell ;

which is perhaps paralleled by a Fife one relating to Kinghorn:

Here stands a kirk without a steeple,
A drucken priest, and a graceless people.
And very emphatic was the imprecation on the owner of a Stirlingshire village:

Baron o' Bucklyvie,
May the foul fiend drive ye,
An' a' to pieces rive ye,
For biggin' sic a toun,
Where there's neither horse-meat nor man's
meat,
Nor a chair to sit down.

A CALL ON THE 'PHONE.

By H. HUNTER.

RAIN was falling—had been falling steadily for hours.

Bert Willoughby pulled at his cigar, and, turning from the window, flung himself into the low easy-chair by the brightly burning fire, his face a picture of weariness and disgust.

'Guess I was a fool to come back,' he yawned, staring gloomily at the ceiling. 'Over there I was somebody. Over here I'm nobody—only one of the crowd, just a human item; and in this swagger hotel not even that—only a number—22, B Floor—like a blooming convict.'

It was less than a fortnight since Mr Willoughby had returned from the Yukon; but to-day he was almost persuaded that 'coming home' was a big mistake. He had been away too long.

'I suppose I'm in a downright beastly frame of mind,' he muttered, watching the smoke as it drifted away from the end of his cigar. 'But I reckon it would beat the band to be jolly under these circo. I don't know anybody, and nobody knows me. I'd plank down every dollar of the big wad I'm carrying on me at this present only to hear the tinkle of the old dog-team coming up the trail. 'Twould sound sort o' friendly, anyhow.'

Willoughby had put in eight years on the gold trail; and five out of the eight were a nightmare to him now whenever he closed his eyes, and let his mind run back to the days when the icy stream and the frozen ground had refused him even a bare living; days when he had lain in his shack too weak to move, too ill to care whether he ever swung a pick or shook a pan again. And now, on this wet Sunday afternoon in London, a lonely man in the 'swagger' hotel, he saw a log cabin in the Yukon; himself, hardly able to stand, in the doorway; and a girl with a pick in her hand, and her face flushed with the exercise, digging for all she was worth, but without making much impression, at the frozen gravel.

His luck had been out for months and months. Indeed, it had never been properly in. Now and then, however, he had dropped on a small 'pocket,' with just enough in it to keep hope alive. And he had stuck to the trail.

On one of these occasions, the 'pocket' having been a little fuller than usual, he had gone down to Dawson.

In a gaunt frame-building, across the whole front of which was roughly painted in great red letters the words 'Opera House,' a variety entertainment was being given.

Willoughby paid a dollar for a seat, and saw there a girl who struck him as having drifted rather a long way out of her latitude. He wondered, in fact, what she was doing there. She was billed as Madge Minton, and had a very sweet voice—clear, bell-like, and of good compass. Also, she was a strikingly pretty girl, but of a type altogether different from the bold-eyed beauties who accepted 'dust' and drinks from all and sundry, passing jokes and lavishing smiles as they fitted hither and thither amongst the audience, when they were not displaying their lingerie or otherwise advertising themselves on the stage. Obviously the girl was out of her element. The man felt sorry for her; and again he wondered how she came there, what she was doing in that crew, and a few other things besides. Anyway, she held him; and he determined to seek her out after the 'show,' and learn something about her.

A 'select' dance was to follow, when the girls would 'foot it' with their friends from the gullies and the creeks, and everybody would help everybody else to make things hum. That would be Willoughby's chance.

The revel was at its height, the air palpitating with excitement, when suddenly there was a commotion.

A big, brawny six-footer from Golden Gulch, who was 'knocking down' his pile in Dawson, had forced himself upon the girl in a way that she was not disposed to allow. The man had passed the limit; and Willoughby had invited him to an interview 'back o' Byers,' where such disputes were often settled before breakfast, unless he apologised in the meantime.

The girl had gone very white. The man's reputation was bad. 'That's Buckeye!' she said. 'Bully Buckeye!'

'I know,' said Willoughby. 'What of it?'

'Well, of all the toughs that come into Dawson he's the roughest. They say he killed a man once; and I don't want him to hurt you. I've met him before, and am willing to believe that he honestly thought he had some ground for the mistake he made.'

But Bert refused to listen. 'He shall beat

me black, blue, and yellow before I'll allow you to be mauled about by a great, coarse beast like Buckeye,' he declared emphatically.

However, there's a code of manners—and morals even—in the wild, and before the dance finished the offender staggered up to where Willoughby and the girl were standing, and made his amends. 'Mistake, pard!' he hiccuped, taking Bert aside. 'Sorry! Awf'ly sorry! Cut out—tongue 'fore ever I'd say a word as 'u'd hurt a good woman. But you know, pard, we don't meet many up here. Now yer can kick me roun' the town if you've a mind to, and I won't raise a howl. I'll take it as a tonic. You won't? Then grip! But tell her fro' me to drop punching the pianner at them dance-halls in camp if she doan wan' be mistook. You unnerstan'—give her a hint.' And the incident closed, but it left Willoughby with an uncomfortable sense of the danger to which the girl was exposed.

Madge Minton, otherwise Susie White, was the daughter of a struggling professional man in London—a hard-working East End doctor. Adopting the stage as her own profession, she had come out to the States to look for chances, and after various experiences had found herself stranded in Seattle, where what was left of the company of which she was a member was disbanded, she herself at the time being sick. Two of the girls had gone up to the Klondike, where they heard there was big money to be earned; and, when she felt strong enough, Susie White had followed.

'Well,' said Willoughby, after he had heard her story, 'you'll do no good up here, anyway. You won't get the audience up to your songs; and you can't come down to them and keep your self-respect.'

She smiled a pathetic little smile. 'But I guess I shall have to—come down to them. Playing the piano at a dance-hall, I agree, is bad form for a girl in the Klondike, only one remove from being a dance-hall girl one's self—which is why I was willing to make allowance for Buckeye. Yet, if I don't give them—what they pay for—something with pepper and spice in it, and a short-skirt dance for me, I shall get "fired." And then—as she looked him straight in the face with a frank, open eye—'well, there will only be the dance-hall piano between me and—the river. Only,' with a pretty hesitation, 'I couldn't face the crowd if I thought you were in the house. So I want you to promise'—

'Now, listen to me,' broke in Willoughby, a certain sternness in his voice. 'You've been up here for three months; but I've been here for five years. And if you don't get out it'll be hell at the last for a girl like you. And do it now,' he urged, 'while the pass is open, or you may get shut in for the winter. The bits—the dimes—the nickels? Is that the difficulty? Well, as a countryman of yours, I claim the

right to help you. At the moment, fortunately, I'm able to do it.'

She protested; but he insisted. 'You've got a clear call home. You left a father and a sister there; and the Klondike is no place for women, unless of a sort that ought not to rub shoulders with you. Now, I left nobody; and my work is here. But before I hit the trail again I want to see you on the way out.'

Next day he bade her farewell, and wished her God-speed. What he had given her had nearly emptied his 'sack'; and for weeks afterwards Willoughby's luck was rotten. Then, just before winter came, he struck up with a chap who had staked out a claim on the Little Bonanza. Before they could start in, however, Tom Matthews, Willoughby's partner, dropped out—died, his last act being to make over all his rights in the claim to his 'chum, Bert Willoughby.'

But Fate seemed to be playing it low on Willoughby just then, for he had only started to put in the assessment work when he was laid up himself. Day after day he had not strength enough to lift the pick, let alone swing it. How he was to get in the full number of days to comply with the law before the expiration of the time-limit, and so save his rights, was beginning to worry him.

Labour on the Creek was very scarce, and Willoughby was unable to go in search of it. Then, when hope was almost dead, a girl had come to his cabin. 'You!' he stammered. 'What are you doing here? I thought you'—

'The White Pass was closed, so'—

'You came back?'

'Yes. No sense in stopping at Lake Bennett. Nothing doing there. Been staying down in Dawson. Then I heard that you were on the Little Bonanza nursing a man who was queer; so I came up with the dog-team to do the nursing, and let you get on with the work. When you've no more use for me, guess I'll hit the trail again for home, and follow it to a finish.'

Bert told his story; and the girl, notwithstanding his protests, at once seized the heavy pick and went out on to the claim. He had managed to keep his fires going fairly well; but the ground was still too stubborn to yield to what effort she was able to bring against it.

'Reckon 'bout the best thing I can do for you,' she said when her hands were sore and her arms aching, 'is to go back with the team, and send you some help.'

Standing at the door, he followed her with his eyes till the dogs who were bearing her away disappeared down the trail. At the bend he saw her look round and wave her hand. Then, turning into his cabin, he dropped into the chair in front of the Yukon stove, forgetting even to light his pipe, and sat for a solid hour thinking of the might-have-beens, the yesterdays, the missed chances of his life.

Time and again since then he wished he had not let her go—anyway, that he had not lost touch with her; for the claim turned out to be the richest on the Creek. Pocket after pocket was found, and well filled, too; while the veins ran into ridges, the streaks into seams. By the end of the third season Willoughby was well on the way to finish up as a dollar millionaire.

It had been a hard fight to get his assessment work done in time, and but for the girl he doubted whether he would have been able to make good. Yes, it was she whom he had to thank for all he was worth to-day. And now, as he reclined in the big chair on this dismal Sunday afternoon in London, he could see her slim, lithe figure wielding the heavy pick, and hear her merry laugh as she said, 'I guess I shall be a pretty long time getting down to the pay-dirt. But it's up to me to do it, or find somebody who can.'

Faintly he heard the telephone-bell in his room ring. 'What's that mean, anyway?' he muttered. 'I don't know a soul in London, and nobody in London knows me.'

The bell rang again, sharply.

'Bother!' he exclaimed petulantly, going over. 'Hallo!' he called. 'Are you there? Are—you—there? . . . What? Yes, Willoughby! . . . Yes, I said so.'

For the next minute and a half he held the receiver glued to his ear, while he listened to a message which both puzzled and amused him.

'Eh? Where?'

There seemed to be more than one person talking. 'Oh, Bloomsbury! . . . Yes, all right! . . . No, don't worry!' And, with a laugh, he hung up the receiver.

Planting himself on the hearthrug, legs apart, he took a long pull at his cigar.

'What's it mean, I wonder, anyhow? A hoax; or are there really two of us who, in this city of millions, haven't a friend to make life worth living? Only, how the dickens did'—He broke off, threw the end of his cigar in the fender, and chuckled immoderately to himself. 'An adventure! Yes, certainly an adventure!'

'I'm sure you must think me an amazingly cool hand—quite the boldest girl that ever lived. It's what I'm thinking of myself. And yet really I'm not,' she had said. 'But I just had to do it, or— Well, I just had to,' she repeated more energetically. 'Though, being a man, of course you won't understand.'

'No,' he commented, 'of course not, when I'm suffering from the same complaint myself. A lonely little girl in lodgings, eh?' he mused. 'And so utterly sick of herself this depressing Sunday afternoon in November that, in sheer desperation, she had asked a stranger to have pity on her, and take her somewhere for an hour—anywhere fit for a respectable girl to go.'

'But,' she had finished up, 'if you do come I'm sure I shall be ashamed to see you.'

Bert Willoughby laughed. It was an audacious proposition, certainly. Unheard of—almost unimaginable. But anything, it was said, might happen in London; and so it seemed. He had been rung up on the telephone in a mysterious way by a mysterious girl who had made a request which, if not actually mysterious, was certainly startling.

The adventure appealed to him; its novelty amused him; the unknown herself interested him; and a quarter to six found him knocking at the door of a certain house in Bloomsbury.

'I think it must be the genelman what you said you was expectin', miss,' said the small 'general,' grinning as she noticed how the colour came and went in the girl's face. 'But Light was the name he asked for—Miss Light.'

'Thank you, Mary!' said the girl hastily. 'P'raps you misunderstood.'

At the door of the visitors' room she paused and pressed her hand to her heart. It was galloping terribly. What would he think of her? What manner of man would he prove to be himself? It was a dreadful thing that she had done. Of course, if she didn't like him she must find some excuse. She opened the door, but halted on the threshold.

'Madge!' he cried, coming forward.

She stared in silence at the tall figure with the smiling mouth.

'Don't you know me? I'm Bert—and, of all the things that could have happened, this, the least likely, is the most welcome. The unexpected has scored again.'

'But—I—don't understand,' she faltered.

He shrugged his shoulders and laughed.

She looked at him helplessly—confusedly. 'I don't understand,' she repeated. 'I'—She stopped abruptly.

'Does it matter? Call it fate! Obviously it was to happen, since the chances were altogether against its occurring.'

'Well, it wasn't the sort of thing for me to do,' she said nervously; 'and if'—

'Pooh!' he returned lightly. 'I'm glad—real glad—you had the courage to dare. If I hadn't been the sort you felt you could trust yourself with, you'd have sent me about my business directly.'

'Then you don't despise me?'

'Poor little girl!' he crooned soothingly, and would have taken her in his arms, but she drew back. 'And were you really feeling so almighty lonely in this great, overgrown Babylon that'—

'Lonely!' she exclaimed, speaking swiftly. 'Just the loneliest girl in the world; lonelier than ever I felt in the Klondike; lonely enough to do the mad, desperate thing which I did; and of which, now I've come to my senses, I feel heartily ashamed. But, I couldn't shake off the feeling which had seized me. In all London, with its teeming millions, there wasn't a soul with whom I could claim kinship—not one to

whom I might look for a kind word. And it just scared me. I suppose the weather, the constant drip-drip of the rain, and the silent house had got on my nerves. Everybody was out; everybody had somewhere to go, some one to meet—everybody but me! I bore it till I could bear it no longer. Then I went down to the hall. We've a telephone there. The book was open. Some one, I suppose, had been using it. Closing my eyes, I placed my hand on the page—a child's trick—and took the name my finger pointed to.'

He smiled. 'The man you rang up, I expect, is a resident in the Savoy precinct. There must be lots of Willoughbys in London; and owing to some fault in the wires—these things do happen, you know—I got the message instead of him. P'raps we both got it. It was a tangled-up affair, anyhow. I heard more than one person talking. However,' he broke off, laughing, 'he hasn't turned up; so I reckon you'll have to put up with me, if you don't mind.'

'And you aren't shocked at my'—

'Shocked! My dear girl, it must have been an inspiration. But, seriously, Madge, somehow I've always thought of you by the name I first knew you by over in Dawson; and it was about you I was thinking when I heard the call on the 'phone. Well, now that Fate—yes,' his dark eyes gleaming—'what else could it have been?—now that Fate has interested herself on our behalf, we must show ourselves grateful, and not waste the—er—precious minutes in—er—saying nothing. Anyway,' he laughed, 'I've a lot to say to you. And the first is that such a mighty nice girl has got no sort of business to be floating round the world by herself. Do you follow—savvy, as we used to say over yonder?'

There was no mistaking his meaning, and, overwhelmed, she was silent. Faced with a situation for which she was totally unprepared, she was uncertain how to act.

'Shall I take you somewhere?' he said gently, *à propos* of the purpose of his visit. 'Let's see—where?'

'I don't think it matters now,' she said, smiling feebly, a faint colour tingeing her cheeks. The desire, springing as it did from an abnormal mood, had already passed.

'Well, come back with me to the Savoy, anyway. There's a cab at the door. An orchestra plays in the Palm Lounge, and sometimes there's singing. But I've never cared to sit there. I always felt sort of out of the picture. But to-night, Madge!' he cried exultingly—'to-night I guess we'll be right bang in front of the picture. I've been feeling the loneliness of the great city myself; and this afternoon I was just about fed up with it when the telephone began to call. I was of two minds whether to answer it. Couldn't be for me. But the bell kept ringing. Gad!' he exclaimed, 'don't tell me these things happen by chance. I don't believe it, though I can't

explain it. But this I know, that many and many a time out yonder my heart has cried aloud for somebody; and sometimes, out of the great white silence, I have heard a voice which has called to me. This meeting, unforeseen by either, is the answer to a question we have both asked of the future. Shall we accept it?'

She smiled, her eyes bright with sudden tears.

'Anyway, before we decide,' he said gaily, 'I've a yarn to spin you, my girl—a yarn which'—He threw back his head and laughed. 'My word! but I struck it rich at the last—as rich, Madge, as any. *Our* claim, partner, turned out to be the richest for its size in Alaska; and it wasn't the smallest one either. Never a day for weeks and weeks when it didn't yield fifty ounces—nine hundred dollars! There was a fortune in every square yard. Now you and I have got to come to an understanding, pard,' he said, smiling into her eyes.

A little quiver played round the corners of her mouth.

'Yes, an understanding! As my partner, you're a rich wom'—

'But I'—

'Fact, my dear!' he cut in, 'solid as the earth, hard as the ground on the day you went out to put in the first day's work on the claim. And you can't argue against facts. You must adjust yourself to 'em. Now come right back with me, and I'll tell you the story.'

It was eleven o'clock, and the Palm Lounge was deserted. His story, and hers too, had been told. But he had still something left to say; and now, as she leaned toward him, her heart yearning for love and happiness, he said it. 'Then, since we're both in the same boat to-day, all alone, by ourselves, Madge, I guess we'd better finish the voyage together. What say? Will you trust yourself to me?'

Her heart was too full for speech; its throbbing was almost painful; but she gave him her hand, and her eyes looked straight into his. There was no mistaking their answer.

FOR ENGLAND.

By J. D. BURNS. (An Australian killed at the Dardanelles.)

THE bugles of England were blowing o'er the sea,
As they had called a thousand times, calling now
to me;

They woke me from dreaming in the dawning of
the day—
The bugles of England, and how could I stay?

The banners of England, unfurled across the sea,
Floating out upon the wind, were beckoning to me;
Storm-rent and battle-torn, smoke-stained and gray—
The banners of England, and how could I stay?

Oh England, I heard the cry of those that died for thee
Sounding like an organ-voice across the winter sea;
They lived and died for England, and gladly went
their way.

England! oh England! how could I stay?

Chambers's Journal

SEVENTH SERIES

A TRENCH LETTER.

MY DEAR P.,—In the summer I described to you a typical day during our attempted offensive. We and the French have now made another effort against the Bosch fortress, so I will try (and it is really the first opportunity) to send you, at the Dardanelles, some word of our recent experiences.

You will remember how widely it was reported in the summer that the Allies would attempt no serious aggressive in the West until late in the year, when our New Army would have had time to get some experience of war conditions. It looks now as though politics—Balkan politics perhaps—forced us from nibbling to biting, and it has proved a tough mouthful, though we nearly swallowed it at a gulp—so nearly! What fun the military critics will have some day, when that censor and his blue pencil have ceased to reign!

You will have read of Hill 70 and the road to Lens; both crowded the papers for days. Lens is the central mining town of Artois—something as Chester-le-Street is to the North Durham field. Like all this country, it has a warlike history too. Wasn't it in *Twenty Years After* that Bragelonne first saw fire when Condé beat the Spaniards at Lens? We haven't got there yet, but it was no fault of the gallant Division of Highlanders who first carried the slopes of Hill 70. We spent two strenuous days there, and from my trench on the slope I watched at brief intervals the battle over the lower ground to the north—a real spectacle, thrilling beyond words, for we knew the regiments engaged, and strained our eyes to see how our friends were faring.

Then we were moved to another section of this famous Vermelles salient, to improve new trenches and dig and burrow and prepare for new attacks. The days have been so crowded with incident and bare of sleep that there is little sequence in one's memory; but one particular day I will describe to you—it was so typical—and I remember it well, because it was the day we were relieved for a short forty-eight hours' rest to sleep and scrub—I was going to say scrape! The weather has been clear and cold, and that morning was particularly fine. Isn't it a curious sensation to look over a wasted country, knowing there are hundreds of men to the acre, and yet not a soul in sight, and just a few gray smoke-trickles from breakfast fires,

and endless scars and scrapes of gray and yellow earth—yellow where newly turned, gray where the chalk crops up through the clay? From above it must look as though some mighty farmer had gone clean mad with a Titan's plough! The early morning is the special hour of the flying folk; this particular morning they were out in force, and shelling had begun much earlier than usual. (The Bosch likes a quiet breakfast.) Suddenly, on our part of the line, the firing died down, and here and there heads appeared and faces gazing up. Three of our aircraft had got above and headed off a Bosch 'albatross;' for ten wild minutes hunters and quarry soared and swung, curved and climbed, till the Bosch gave it up and lighted well back in our lines—quite close, it turned out, to our transport, who had the excitement of securing the pilot and his observer. We, in the front line, having had our air battle as an appetiser, proceeded to breakfast.

The day was ominously peaceful till just before dusk. (We were not to be relieved till ten at night.) Suddenly a mile up the line machine-guns started together, and there was a roar of bombing. Our guns began, too, almost at once, and the Bosch guns were already at it. All in ten minutes a wasted, silent scene turned into a tornado of noise and smoke. You know all about artillery retaliation. It was just our luck that our bit of the line was selected by the Bosch to be bombarded while the fight was going on merrily a mile away. The whole show lasted half-an-hour. My old soldier-servant—after a short scuttle to cover when a shell burst in the far end of the traverse we were in—proceeded to dish out and serve our twilight cocoa, which was boiling up when the shelling began. I wish I could draw him for you, moving about quietly in his gray shirt-sleeves.

When the shelling was over there were wounded to help down the trench to the dressing-station, two poor chaps to bury, and many shattered parapets to rebuild. Our men are such nailers at that work, they would make any contractor's fortune. Later, when they'd mended the telephone-wire, a friend rang through to tell us that the bomb attack by the Bosch on the right had failed; they'd come out in the open and suffered heavily.

It was midnight before our relief arrived, and the trench was full of sulphur smoke, as the

Bosch had shelled us again, and had battered down much of the communication trench. It's strange to wander down these endless burrows at night, with every object above the parapet showing in distorted shapes; occasionally stumbling across a pile of débris, and having to go 'out into the open' to pass an obstacle. At last one gets into a real road, and after being a troglodyte for days one feels like Xenophon and his Greeks when they saw the sea at last, and cried, '*Thalatta! thalatta!*'

We emerged above ground just as it was beginning to grow light, and we had a few miles' march back to rest billets, past weird encampments of transport, cavalry, engineers, and all the sundries which cling to the back of an army; down long rows of forlorn poplars; past a great gloomy coal-dump with upturned pit trucks and empty sidings; and so in the early

morning light through untidy little mining villages to our rest billets—and sleep, and soap. I could entertain you with lots of criticism—carping is in vogue just now; but how long did it take Sheridan and Grant to wear down the South? And they had Lincoln behind them, while we have before us a foe fortified as Vauban never hoped, armed as Jules Verne never dreamed, and a master in the art of war. But he *is* beginning to wear. If our folk at home will only play the game and back the army, we shall begin to make headway and to beat him even at bombing—his own game. (Remember, in the eighteenth century the English grenadier companies were the best in the world.) No, this is not a time to be despondent, but to learn from our mistakes and prepare for our next effort. We cannot perform miracles; we must wear the enemy down.

THE DAY OF WRATH.

CHAPTER VII.—THE WOODMAN'S HUT.

THE miller was cunning as a fox. He argued, subtly enough, that if a man just arrived from Argenteau was the first to discover the dead Prussians, the neighbourhood of Argenteau itself might be the last to undergo close search for the 'criminals' who had dared to punish these demi-gods. Following a cattle-path through a series of fields, he entered a country lane about a mile from Visé. It was a narrow, deep-rutted, winding way—a shallow trench cut into the soil by many generations of pack-animals and heavy carts. The long interregnum between the solid pavement of Rome and the broken rubble of Macadam covered Europe with a network of such roads. An unchecked growth of briars, brambles, and every species of prolific weed made this particular track an ideal hiding-place.

Gathering the party under the two irregular lines of pollard oaks which marked the otherwise hardly discernible hedgerows, Joos explained that, at a point nearly half a mile distant, the lane joined the main road which winds along the right bank of the Meuse.

'That is our only real difficulty—the crossing of the road,' he said. 'It is sure to be full of Germans; but if we watch our chance we should contrive to scurry from one side to the other without being seen.'

Such confidence was unquestionably cheering. Even Dalroy, though he put a somewhat sceptical question, did not really doubt that the old man was adopting what might, in the circumstances, prove the best plan.

'What happens when we do reach the other side, Monsieur Joos?' he inquired.

'Then we enter a disused quarry in the depths of a wood. The Meuse nearly surrounds the wood, and there is barely room for a tow-path

between the river's edge and a steep cliff. The quarry forms the landward face, as one may say, and among the trees is a woodman's hut. I shall be surprised if we find any Germans there.'

'From your description it seems to be a suitable post for a strong picket watching the river.'

'No, monsieur. The slope falls away from the river, while the opposite bank is flat and open. I have been a soldier in my time, and I understand these things. It would be all right for observation purposes if these pigs hadn't seized the bridge-heads at Visé and Argenteau; but I saw their cursed Uhlans on the left bank many hours ago.'

'Lead on, friend,' said Dalroy simply. 'When we come within a hundred metres of the main road, let me do the scouting. I'll tell you when and how to advance.'

'Is monsieur a soldier, then?'

'Yes.'

'An officer perhaps?'

'Yes.'

'Ah, a thousand pardons if I presumed to lecture you. Yet I am certainly in the right about the wood.'

'I have never doubted you, Monsieur Joos. Do you know what time the moon rises?'

'Late. Eleven o'clock at the earliest.'

'All the better, if you are sure of the way.'

'I could find it blindfolded. So could Léontine. She goes there to pick bilberries.'

The homely phrase was unconsciously dramatic. From the highroad came the raucous singing of German soldiers, the falsetto of drunkards with an ear for music. In the distance heavy artillery was growling, and high-explosive shells were bursting with a violence that seemed to rend the sky. Over an area of many miles to the west

the sharp tapping of musketry and the staccato splutter of machine-guns told of hundreds of thousands of men engaged in a fierce struggle for supremacy. On every hand the horizon was red with the glare of burning houses. The thought of a village girl picking bilberries in a land so scarred by war and rapine produced an effect at once striking and fantastic. It was as though a ray of pure white light had pierced the lurid depths of a volcano.

Dalroy advised the women to take off their linen aprons, and Madame Joos to remove as well a coil of the same material. He unfastened and threw away the stump of the bayonet. Then they moved on in Indian file, the miller leading.

A definite quality of blackness loomed above the low-lying shroud of mist which at night in still weather always marks the course of a great river.

'The wood!' whispered Joos. 'We are near the road now.'

Dalroy went forward to spy out the conditions. A column of infantry was passing. These fellows were silent, and therefore sinister. They marched like tired men, and their shuffling feet raised a cloud of dust.

An officer lighted a cigarette. 'Those guzzling Prussians would empty the Meuse if it ran with wine,' he growled, evidently in response to a remark from a companion.

'Our brigadier was very angry about the broken bottles in the streets of Argenteau,' said the other. 'Two tires were ruined before the chauffeur realised that the place was littered with glass.'

These were Saxons, cleaner-minded, manlier fellows than the Prussians. Behind them Dalroy heard the rumble of commissariat wagons. He failed utterly to understand the why and wherefore of the direction the troops were taking. According to his reckoning, they should have been going the opposite way. But that was no concern of his at the moment. He knew the Saxon by repute, and hurried back to the two men and three women crouching under a hedge, having already noted a little mound on the left of the cross-roads where cover was available. He explained what they were to do—steal forward one by one, hide behind the mound, and dart across when a longer space than usual separated one wagon from another, as the mounted escort would probably be grouped in front and in rear of the convoy.

'Ah, that is the calvary,' said Joos. 'It stands on a rock by the roadside.'

'It is hard to distinguish anything owing to mist and dust,' said Dalroy. 'Of course, the darkness is all to the good.—If you ladies do not scream, whatever happens, and if you run quickly when I give the word, I don't think there will be any real danger.'

In the event, they were able to cross the road in a body, and without needless haste. A horse

stumbled and fell, and had to be unharnessed before being got on to its feet again. The incident held up the column during some minutes, so Dalroy was not compelled to abandon the rifle, which it would have been foolish in the extreme to carry if there was the slightest chance of being seen.

Thenceforth progress was safe, though slow and difficult, because the gloom beneath the trees was that of a vault. Even the miller perforce yielded place to Léontine's young eyes and sureness of foot. There were times, during the ascent of one side of the quarry, when whispered directions were necessary, while Madame Joos had to be hauled up a few awkward places bodily.

Still, they reached the hut, a mere logger's shed, but a veritable haven for people so manifestly in peril. They were weary, too. No member of the Joos household had slept throughout the whole of Tuesday night, and the women especially were flagging under the strain.

The little cabin held an abundant store of shavings, because its normal tenant rough-hewed his logs into sabots. Here, then, was a soft, warm, and fragrant resting-place. Dalroy took command. He forbade talking, even in whispers. Maertz, who promised to keep awake, was put on guard outside till the moon rose.

The wisdom of preventing excited conversation was shown by the fact that the five people huddled together on the shavings were soon asleep. There was nothing strange in this. Humanity, when surfeited with emotion, becomes calm, almost phlegmatic. Were it otherwise, after a week of war soldiers would not be sane men, but maniacs.

Dalroy resolved to sleep for two hours. About eleven o'clock he got up, went quietly to the door, and found Maertz seated on the ground, his back propped against the wall, and his head sunk on his breast. As a consequence, he was snoring melodiously.

He woke quickly enough when the Englishman's hand was clapped over his mouth and held there until his torpid wits were sufficiently clear that he should understand the stern words muttered in his ear.

'Pardon, monsieur,' he said shamefacedly. 'I thought there was no harm in sitting down. I listened to the guns, and began counting them. I counted one hundred and ninety-nine shots, I think, and then'—

'And then you risked six lives, Léontine's among them!'

'Monsieur, I have no excuse.'

'Yet you have been a soldier, I suppose? And you gabble of serving your country?'

'It will not happen again, monsieur.'

Dalroy pretended an anger he did not really feel. He wanted this stolid Walloon to remain awake now, at any rate, so he turned away with an ejaculation of contempt.

Maertz rose. He endured an eloquent silence for nearly a minute. Then he murmured, 'Monsieur, I shall not offend a second time. Counting guns is worse than watching sheep jumping a fence.'

The moon had risen, revealing a cleared space in front of the hut. A dozen yards away a thin fringe of brushwood and small trees marked the edge of the quarry, while the woodcutter's path was discernible on the left. A slight breeze had called into being the myriad tongues of the wood, and Dalroy realised that the unceasing cannonade, joined to the rustling of the leaves, would drown any sound of an approaching enemy until it was too late to retreat. He knew that Von Halwig, not to mention the military authorities at Visé, would spare no effort to hunt out and destroy the man who had dared to flout the might of Germany; so he was far from satisfied with the apparent safety of even this secluded refuge.

'Have you a piece of string in your pockets?' he demanded gruffly.

Trust a carter to carry string, strong stuff warranted to mend temporarily a broken strap. Maertz gave him a quantity.

'I am going to the cross-road,' he continued. 'Keep a close watch till I return. When you hear any movement, or see any one, say clearly, "Visé." If it is I, I shall answer, "Liège." Do you understand?'

'Perfectly, monsieur. A challenge and a countersign.'

Dalroy believed the man might be trusted now. Taking the rifle, he made off along the path, treading as softly as the cumbrous sabots would permit. He was tempted to go barefooted, but dreaded the lameness which might result from a thorn or a sharp rock. At a suitable place, half-way down the steep path by the side of the quarry, he tied a pistol to a stout sapling, and, having fastened a cord to the trigger, arranged it in such fashion that it must catch the feet of any one coming that way. The weapon was at full cock, and in all likelihood the unwary passer-by would get a bullet in his body.

It was dark under the trees, of course; but the moon was momentarily increasing its light, and the way was not hard to find. He memorised each awkward turn and twist, in case he had to retreat in a hurry. Once the lower level was reached there was no difficulty, and, with due precautions, he gained the shelter of a hedge close to the main road.

The stream of troops still continued. Few things could be more ominous than this unending torrent of armed men. By how many similar roads, he wondered, was Germany pouring her legions into tiny Belgium? Was she forcing the French frontier in the same remorseless way? And what of Russia? When he left Berlin the talk was only of marching against the two great

Allies. If Germany could spare such a host of horse, foot, and artillery for the overrunning of Belgium, while moving the enormous forces needed on both flanks, what millions of men she must have placed under arms long before the mobilisation order was announced publicly! And what was Britain doing and saying? Britain! the home of liberty and a free press, where demagogues spouted platitudes about the 'curse of militarism,' and encouraged that very monster by leaving the richest country in the world open to just such a sudden and merciless attack as Belgium was undergoing before his eyes!

Lying there among the undergrowth, listening to the tramp of an army corps, and watching the flicker of countless rifle-barrels in the moonlight, he forgot his own plight, and thought only of the unpreparedness of Britain. He was a soldier by training and inclination. He harboured no delusions. Man for man, the alert, intelligent, and chivalrous British army was far superior to the cannon-fodder of the German machine. But of what avail was the hundred thousand Britain could put in the field in the west of Europe against the four millions of Germany? Here was no combat of a David and a Goliath, but of one man against forty. Naturally, France and Russia came into the picture; yet he feared that France would break at the outset of the campaign, while Austria might hold Russia in check long enough to enable Germany to work her murderous design. Be it remembered, he could not possibly estimate the fine and fierce valour of the resistance offered by Belgium. It seemed to him that the Teuton hordes must already be hacking their way to the coast, leaving sufficient men and guns to contain the Belgian fortresses, and halting only when the white cliffs of England were visible across the Channel.

If his anxious thoughts wandered, however, and a gnawing doubt ate into his soul lest the British fleet might, as the Germans in Visé claimed, have been taken at a disadvantage, he did not allow his eyes and ears to neglect the duties of the hour.

A fall in the temperature had condensed the river mist, and the air near the ground was much clearer now than at eight o'clock. The breeze, too, gathered the dust into wraiths and scurrying wisps through which glimpses of the sloping uplands toward Aix were obtainable. During one of these unhampered moments he caught sight of something so weird and uncanny that he was positively startled.

A sorrow-laden, waxen-hued face seemed to peer at him for an instant, and then vanish. But there could be no face so high in the air, twenty feet or more above the heads of a Prussian regiment bawling, '*Deutschland, Deutschland über alles.*' The land was level thereabouts. The apparition, consequently, must be a mere trick of the imagination. Yet he saw, or fancied he saw, that same spectral face twice again at

intervals of a few seconds, and was vexed with himself for allowing his bemused senses to yield to some supernatural influence. Then the vision came a fourth time, and a thrill ran through every fibre in his body.

Because there could be no mistake now. The face, so mournful, so benign, so pitying, bore on the forehead a crown of thorns! Even while the blood coursed in Dalroy's veins with the awe of it, he knew that he was looking at the figure

of Christ on the Cross. This, then, was the calvary spoken of by Joos, and invisible in the earlier murk. The beams of the risen moon etched the painted carving in most realistic lights and shadows. The pallid skin glistened as though in agony. The big, piercing eyes gazed down at the passing soldiers as the Man of Sorrows might have looked at the heedless legionaries of Rome.

(Continued on page 132.)

FISH FOOD, AND HOW TO COOK IT.

By CLIFFORD CORDLEY.

MEDICAL men and other experts on diet laud the herring, either fresh or in the bloater stage, as ideal food, whether regarded from the edible or the nutritive standpoint. But the common herring, seasonable in autumn, winter, and spring, is a somewhat scarce fish in war-time, when fish food is a subject so important to the nation at large.

By way of introducing our subject, let us glance cursorily at the past. There is a quaint old book treating of fish in the medieval kitchen. This work is styled *The Forme of Cury: a Roll of Ancient English Cookery*. It was compiled about 1390 by the master-cook of King Richard the Second. This roll shows that certain species of fish were not much eaten in the fourteenth century, whilst others, now largely neglected, were valued. However, we find that this royal chef prepared fish-jelly, and also sent to table roach, tench, ruffe, and pike. There is no reference to most palatable perch; but it is stated that porpoise was highly esteemed, and deemed altogether a dish to set before a king. As regal food, also, were regarded the mackerel, turbot, gurnards, sole, loach, lampreys, lamperns, and tench; of which last-mentioned more anon. In those bygone, jolly medieval days, sellers of fresh-water fish were dubbed 'pikemongers'—another proof of the olden-time value of the luce or pike as a fish food.

Whether by experience or by repute we all know the toothsome-ness of the game varieties of British fresh-water fishes: of salmon, of sea-trout, under its various names of sewin, salmon-trout, peel, mort, and, in the grilse stage, herling, whitling, finnock, &c.; of brown or brook trout; and of grayling; all of which are costly to buy, and still more so to kill with the angle-rod even in times of peace. Pretty generally, however, the culinary value of so-called 'coarse' or 'rough' fishes is alike misunderstood and neglected; and yet these are so valuable, and are, or might be, and should be, so plentiful in these islands. It was not always thus in Britain.

According to Chaucer, the average country gentleman five hundred years ago kept bream and pike in stew, and—mark this, for it is

important—fed them. Then, and later, every lord, squire, yeoman, bishop, abbot, prior, and every other owner and even occupier of land and water, kept, cultivated, and preserved 'coarse' fish in moat, stew, pond, pool, or dike; and these old-fashioned folk were well aware that cultured fishes were more palatable than excursive ones, contrary to Johnson's dictum with regard to feathered and furred game. They cooked and ate, with relish and nourishment, pike, perch, dace, carp, tench, gudgeon, loaches, and eels, most of which, save luscious eels, are too little eaten in these up-to-date times, when we are up to the eyes in war and up to the neck in debt.

There are in British waters over forty varieties of fresh-water fishes, all of which are edible. Indeed, Sir Herbert Maxwell specifies some fifty or more, of which some, as they ascend rivers to spawn, pertain alike to marine and fluviatile orders, and others are merely variants of better-known species. Even the gudgeon (which some anglers regard merely as bait), the minnow, the bleak, and the loach may be made as pleasing to the palate as the overrated whitebait; while eels, lampreys, and lamperns are esteemed as delicacies by those who have eaten of them—properly cooked. It is the cook who wins or loses the trick. On the Continent carp and tench are served and eaten as dainties, owing largely, but not entirely, to the accompanying sauces. We need not follow Walton's tip, and disguise the flavour of our fish with anchovy, wine, herbs, and other foreign matter; but we might take a hint from an enemy land, where coarse fish are largely provided and eaten. Nor must we forget the exquisite smelt, swarming in estuarine waters, and seasonable in autumn and winter. Most dainty food, it is, alas! very perishable. Also, the toothsome gray mullet, strictly a marine variety of fish, is largely prevalent in the lower waters of certain of our rivers in August and succeeding months.

Especially in these times, the cook is too apt to be prejudiced in favour of costly flesh food, and to despise the far more economically valuable qualities of fish, including some of the roughest

of 'coarse' varieties. Let us consider how best to prepare for table and palate the humblest fishes of British streams and enclosed waters.

The ways in which fish is ordinarily introduced at many British tables are: firstly, boiled with water for the main ingredient, the flesh saturated for want of exactness on the part of the cook; secondly, fried, the skin either pale or colourless, or of dark, unpleasing hue, and limp and greasy, also the result of carelessness or ignorance of the cook; and, thirdly, broiled, which turns out well, provided always that the fire is bright and clear, and the operation executed with cleanliness and precision. The appetising *souchet* (a dish of Dutch origin), *poisson au gratin*, fricassees, stews, fish-pies, twice-laid, rissoles, and, above all, the *bouillabaisse* (lauded in verse by Thackeray) are largely strangers on many British tables.

From a gustatory point of view, fish has great value, and deserves, and demands, much more favour than it gets. From a sanatory point of view there is no question as to the worth of fish. As a matter of national and individual economy, under existing abnormal circumstances and conditions little likely to relax for some time to come, fish food ought to be, and should be, largely used.

We hardly need to treat of the cooking of salmon, sewin, trout, and grayling. It will be more profitable to deal briefly with the preparation for the table of pike, perch, eels, tench, carp, dace, gudgeon, bream, and other common and fairly plentiful species. Eels may be boiled, stewed, fried, served as a pie, or potted; whilst eel-soup is alike dainty and strengthening. Perch may be served up in many excellent fashions: grilled like a haddock, floating in *souchet* (which is stock), fried in fillets with egg and bread-crumbs, stuffed and baked, stewed like a red mullet, or broiled, with inside intact, and head, gills, and scales remaining—for the time being. With this fish, as with all others, it is important that it should be fresh from the water, and be of medium rather than of abnormal size. A perch from running water is far preferable to one from reservoir, pool, or pond.

The tench and the carp, being closely allied, may be treated together here, and somewhat similarly in the kitchen. Our dear Gallic friends and Allies stew and fry these fish, while the inhabitants of Germany, previously hinted at, greatly cherish the carp family. There is tench-pie, and there are boiled carp, baked carp, marinade (which is, roughly, pickle) of carp, grilled carp, and matelote (a mixture or *salmagundi* of fishes); preparations of tench, pickerel, and eels. Stewed barbel may (perhaps) be made toothsome to some mouths, while gudgeon should be fried like the exquisite smelt. Nor must we forget the flounder, which is a delicious fish. Pike may be baked, or confected as pie, or potted; but, preferably, a jack should

be boiled, mackerel fashion, with appropriate sauce—as parsley, caper, Hollandaise, or what not—according to that taste about which there is proverbially no disputing; and a pike should be stuffed, roasted, basted, and exhibited much as one would deal with a hare or a fillet of veal. By jack one means a fish of a few pounds weight; by pike, a specimen of at least ten pounds ponderosity. As for the villain chub, one fears that the cook must generally reject these 'skillies,' while bream, beloved of our ancestors, cannot be recommended highly. Similarly with barbel, or more so.

But in order to have an abundance of fish food we must have an abundance of fish. There is no reason why the majority of fishes which are found in our rivers, meres, lochs, lakes, reservoirs, ponds, pools, moats, dikes, and watery areas generally should not be both plentiful and cheap, should not furnish desirable, delectable, and provident food for the million. Game fish—the salmonidæ—should be preserved, protected, conserved, cultivated. A good example is set by numerous corporations, which have stocked their reservoirs with trout, thus providing sport, revenue, and aliment. All manner of coarse fish should be bred, fed, and reared, as are sheep, cattle, and poultry. The harvest of the waters may be made as profitable as that of the land. Where streams are flowing, and where enclosed waters have ingress and egress, trout may be cultivated: Fario, Rainbows, Lochlevens, &c. But every reservoir, lake, pool, pond, and ornamental water in the British Islands should teem with some of the several varieties of coarse fish, practically all edible: pike, perch, roach, carp, tench, eels, ruff or pope (of the perch family), and burbot or eel-pout, which is very pleasing to the palate. In one of his books Sir Herbert Maxwell says: 'Were we, as a nation, more careful than we are to develop the natural resources of our waters, the burbot would undoubtedly repay care in its propagation, for it would thrive at the expense of less valuable fish in many ponds and lakes now exclusively inhabited by inferior varieties. It is equally at home in running and still waters, and would probably pick up a living wherever it can do so'—that is, wherever it is wet or damp.

But in the preserving of fish and the provision of fish food we must not overlook the fact that the fish themselves must have a sufficiency of nutritious food. Certain plants, certain so-called 'weeds' (often good matter in the wrong place), bushes, trees, shrubs, cresses, crustaceæ, and other piscine aliment, or that which is productive of aliment, must be provided, especially, but not solely, in still and enclosed areas of water.

In planting fish—in fish-farming—the ground needs as careful preparation as the water. Also, particularly as regards the trout family, we need inlets and outlets and aeration. We should bear

in mind the possible adaptation of brooks, burns, and tricklets. Absolutely barren waters, useless and unproductive, which, with a provision of aquatic plants and other fish food, may be rendered fishy and profitable, should be stocked. We should encourage the growth of trees, bushes, shrubs, and long grasses on the banks, together with dahlias, artichokes, and so forth; whilst larvæ of water-flies can be bought and introduced, together with suitable aquatic plants. For further and full information on this most important subject, see *Fish Farming for Pleasure and Profit*, by 'Practical' (the Burlington Publishing Company).

How rarely does one see pike or perch exposed on the slabs of fishmongers! And yet, in the matter of distribution, it must be remembered that fresh-water fishes are no more perishable than are herrings and mackerel; and they should

be bought and sold by all dealers in the vicinity of the waters providing the fishes in question. However, there are signs of progress in this matter. It was recently reported in Midland newspapers that considerable quantities of perch and bream were being sold, from time to time, in the Market Hall at Birmingham. These fish came from the neighbouring Avon. There are in Britain, even in mining and manufacturing districts, innumerable unproductive sheets of water—ornamental lakelets, disused claypits, quarries and other mining holes, dikes, ditches, moats, ponds, pools, and roadside swamps—all of which might, and ought to, contain fish for profit, for sport, and for the supply of that cheap and valuable food for the people for which the demand is now greater than ever it was in the history of the British Islands, and of which the supply is at present so inadequate.

SINGLE-HANDED.

CHAPTER IV.

HIS first act was to locate the mechanism that opened the concealed door. He tried it; the panels parted easily. He opened the door wide enough to slip through, found that he could operate it from the inside, and closed it behind him. Then he went carefully over every detail of the giant tube and the lay-out of the room. The ceiling hung low on heavy beams; that was the cockpit of the gun overhead. He was familiar with all the details of torpedo construction. He went back to his den for his tools, then opened the breech of the tube. For two hours he worked silently and rapidly; then he closed the breech, arranged everything as he had found it, and stood up with a sigh of relief. He had disarranged the steering apparatus of the great steel fish inside. Instead of swimming straight ahead to its mark, this one would curve rapidly away and lose itself in the sea.

So he closed the bulkhead door and sought out one of the smaller iron-bound boxes. This he opened, and found, as he had anticipated, a number of the twenty-pound shells. Four of these he lugged into his den, then carefully hid the box away. Then he once more retired to his den, where the sounds of his work were less likely to be detected.

It was ticklish work opening the big cartridges; but his plans called for it, and open them he must. His trusty bag yielded a small coil of waterproof fuse and some caps; and when his daylight bedtime arrived the four shells had changed into excellent hand-grenades, with five-second fuses. Meanwhile his chart showed that the captain had changed his course, and was now heading south-west. Evidently he had decided to look for victims along the sea-lane between Honolulu and Australian ports.

During the next afternoon the *Cocos* was again chased by a warship, a fast British destroyer this time, which put up a determined race. But the *Cocos's* powerful engines settled to their task, and maintained a lead beyond the range of the destroyer's shells. The captain did not seem anxious to show his utmost speed; he simply kept his distance till night came on. Then he dodged to and fro for a while with lights blanketed, and presently left the British ship far to the leeward, her ineffectual searchlight playing back and forth over the empty waste.

The same ruse had to be repeated next day, this time for the benefit of the Australian cruiser *Sydney*. Crane gathered over the 'phone that she was acting as convoy to a fleet of five merchant vessels. Then, too, certain code messages, picked up during the night by the wireless operator, seemed to indicate that a small gray ship, having given the slip to several war-vessels, was under suspicion. The captain evidently decided that these waters were too well guarded, that he would seek new pastures; for he set a south-west course at a good speed which led, through unfrequented seas, toward the Dutch East Indies.

A week passed by quietly, and the *Cocos* was threading her way through the narrow seas of the Dutch archipelagoes. Not a ship had been sighted except two small traders, with which the *Cocos* exchanged signals, reporting herself as bound from the Marshall Group for Borneo. Twice she stopped at small trading stations, left a little freight, and took on small quantities of shell and copra, doubtless to strengthen her disguise in case of necessity. Certainly the shell part of the cargo strengthened her odour perceptibly. Sometimes men walked through

the corridor within a few feet of Crane, as he lay in his narrow cell; but his luck held. Then one dark night they ran the Strait of Sunda, between Sumatra and Java, and when the morning came were in the Indian Ocean, standing out in the track of shipping from Australia to the Suez Canal.

All this time Crane had been busily working at night and lying hidden by day. His work was laborious and slow, by reason of his inadequate tools and the constant necessity to work noiselessly and leave behind no visible trace of his operations. This much he had accomplished. Digging patiently, hour after hour, with his small gimlet, saw, and chisel, he had hollowed out two spaces in one of the thick ceiling-beams, and had planted two of the twenty-pound shells directly under the feet of the gun-crew on deck, and likewise just over the heads of the torpedo-crew. To make sure, he had planted two more shells in the floor just under the sliding-door through the forward bulkhead. The outside sections of wood removed he fitted back into place, putting the cracks with a mixture of sawdust and baked beans, coloured with scraped iron-rust. These shells were connected up by his fine copper wires, concealed in cracks in the planking, caulked with dust. The wires ran back below the freight and up to his lookout station under the ventilator. The free ends were fastened some three inches apart, so that he could bridge the gap with his saw-blade. Then he brought in a lead from the electric-light wires, and this plant was ready. A simple touch of his switch would seal the fate of every man around the torpedo-tube and the gun above.

The thing that worried him most was the uncertainty as to conditions in the stern of the ship. He suspected that another gun was concealed there, but knew nothing of how it was placed. However, he did not dare to venture on deck, even at night. The slightest suspicion of his presence on board meant death, and, worse than death, the failure of all his plans. He had seriously considered death; it was so easy to blot this ship instantly from the face of the waters. A hammer swung on the nose of one of these torpedoes, and the thing was done. He would go too, like scores of nameless heroes who have given up life gladly to accomplish lesser things for the Motherland. The results were worth the cost, but for one thing. He did not believe that the intelligence which had conceived and directed this grisly masquerade was on this ship. If one such craft could operate, why not a dozen? Were there not others now at large under various disguises? It was his duty to see that the information he had should reach the Admiralty, that the ports and lanes of the Seven Seas be watched for such ghouls. So he could take no unnecessary chances with his life yet.

For two days longer the *Cocos* cruised north-

ward through the Indian Ocean, while Crane grew restless and nervous from enforced confinement and inactivity. Then, in early morning, the lookout reported smoke ahead. Soon it appeared that they were overhauling a fleet of three large passenger-steamers convoyed by a battleship which was in the lead. When this was learned, the *Cocos* slackened speed and allowed the flotilla to draw away. At sundown the lookout reported the smoke barely visible. The crisis was still postponed.

About eight o'clock, however, a message passed over the 'phone that brought Crane up on the alert. Picked up by the wireless operator, it identified the flotilla ahead as H.M. battleship *Dauntless*, convoying three transports that carried five thousand Australian troops, bound to the help of the Mother Country. The speed of the *Cocos* increased, and her course swung slightly to port. Crane let himself out of his chamber and hurried to his lookout post. Soon the deck lights flicked out, and the gun-crew came forward and began stripping the piece. He realised that the captain would try to sink one or more of these transports, and trust to the darkness and his great speed to slip away from the guns of the battleship. They represented great prizes to the captain, well worth the risk. Crane realised that the crisis was at hand, and his courage and determination rose to meet it. Everything hinged on his actions in a few short minutes, and his brain cooled and his muscles hardened to the task.

For two tense hours he lay quietly, while the *Cocos* drove at full speed through the black night. Then he climbed into the ventilator and looked out. A smother of misty rain had come up, and the wind was rising. A better night for this adventure could hardly have been imagined. He felt the speeding ship make a sharp turn, as one feels a railway train take a curve. And off to the lee, almost abreast, he caught sight of the battleship's searchlight playing like a golden pencil on the mist. Behind her, faint yellow spots marked the position of the transports. They had taken no precautions to mask their lights, so secure did they feel in these waters.

The plans of the *Cocos's* captain soon became evident. He had headed to cross the wake of the last transport, at least two miles behind the battleship. In this weather he could come to easy range without being discovered. Then he would hurl his torpedo, and race off at full speed to the rear. Some minutes must elapse before the battleship could get her bearings and turn round; meanwhile his tremendous speed would carry him well beyond the reach of her rain-baffled searchlights. He might even lead her out of the way, then swing back and torpedo the remaining transports.

Swiftly and silently the gray wraith bore down on the placid ship, with her score of hun-

dreds of unsuspecting human lives. Doubtless the troopers were frolicking in the saloons, waiting for the bugle-call of taps, little dreaming that the sinister death-angel so near at hand was preparing their call to death. Crane saw the bright spot in the haze grow rapidly brighter; the outline of the ship, now a scant half-mile away, became distinct. He dropped back into his pit, fumbled for his switch, and fixed eager eyes on the torpedo-crew.

They stood still and ready at their stations, one at the porthole-cover, one at the tube lanyard. There was a low command; the cover slid back; the tube swung into position. With a hiss of escaping air, the slim black shape darted out. A moment passed; it was safely buried in the water, but harmless. Crane's hands bridged his switch, and he dropped back flat on his face. There was a blinding flash and a roar that beat on his ear-drums; the air was full of flying splinters. A box rolled upon him, but he struggled free and leaped to the floor. The forward end of the deck was gone, the hull at the bows split and twisted. The hatchway-ladder was torn away at the floor, but still hung suspended. He leaped and caught it, drew himself up, carrying a heavy box in his free hand, and scrambled out on deck. Men were running and calling out in the darkness. He swung close to the lee rail and raced to the stern. As he drew near he saw that a gun was also mounted here, the crew standing stiffly at attention. He dodged behind a steel ventilator funnel, seized one of the bombs from his box, and struck a match. The officer of the gun-crew came toward him, asking what he wanted. He coolly applied the match to the fuse, held the sputtering thing a moment, then hurled it toward the gun and stepped back. It burst almost instantly, and when he stepped out only the officer was on his feet. He, however, had drawn a pistol and came on firing. Crane felt a shock in his left shoulder, and reeled back. Then he recovered, laid his Leuger against the funnel, and emptied three shots into the man's body.

Picking up his box, he leaped over the crumpled corpses and the wreck of the gun, and stopped at the taffrail. Quickly he lighted another bomb, held it a moment, and dropped it in the foam of the wake, close under the stern. A great wave boiled up, and he grasped the rail to save himself from being washed away. He knew that the shock of the explosion, reacting against the stream of water thrust back by the racing screws, would affect the propeller-blades for an instant, as though the water were solid granite. There was a grinding wrench; the ship gave a leap like a horse struck by a whip, then began to lose speed; while from below came the clatter of engines suddenly released from their load and running wild.

Dashing the water from his eyes, Crane started forward along the black deck. Two men accosted

him, but he dodged around the deckhouse and ran on till he came to the foot of the forward funnel. One of the men he had passed was now following, firing as he ran. Just as Crane started up the ladder that led to the lookout another shock told him that a bullet had pierced his thigh. Still he climbed desperately, his pursuer, seemingly out of cartridges, coming up after him. As he reached the top the lookout leaned over the edge, asking what the trouble was. He received the butt of the heavy automatic pistol full across his forehead, and sank back without a sound. Crane dropped safely over into the steel cylinder, while his pursuer began hastily to climb down.

The *Cocos*, now almost behind the transport, had lost headway, and lay wallowing in the choppy seas. With a blinding flash, a searchlight from the transport was brought into play, enveloping the disabled vessel in a brilliant glare of light; and the big ship swung round toward her, hardly five hundred yards away. A hoarse voice came across the water, asking in good English, 'What's the matter there?'

Crane fumbled on the floor of his cage till he found the lookout's megaphone; then he bellowed a reply: 'This is a hostile German torpedo-boat. Send fifty armed men in your boats.'

They were shooting at him now. Bullets rapped sharply on the steel stack. Then one tore through his forearm, and he almost lost his megaphone. He dropped lower in his cage.

Men were swarming around the boats on the transport's decks. The davits swung out, boats dropped to the water, and men tumbled into them. Two boatloads pushed off and started for the *Cocos*.

'More men,' shouted Crane. 'There are thirty Germans here who will fight to the death.' He was getting very weak now from loss of blood, and he leaned back exhausted in the shelter of the stack. But when a fusillade of shots broke out below—as the Germans, with desperate courage, opened fire on the boats with rifles—he slipped a fresh clip of cartridges into his revolver, leaned over the edge, and commenced shooting down upon them. A volley of shots answered, and a red flame seemed to sear his brain. He crumpled down on the body of the German lookout, and knew no more.

He recovered consciousness with the sensation of lying on something cold and hard. Some one was talking. He opened his eyes cautiously, and saw a ship's surgeon in white, facing several officers in the uniforms of both the British army and navy.

'I think he will do very nicely now, gentlemen,' the surgeon was saying. 'He was most extraordinarily lucky. I have removed the bullet from his shoulder, and those in his leg and arm passed through cleanly. The wound on his head barely touches the skull, and I think there is no concussion.'

'There'll be some cussin' soon,' spoke up

Crane weakly, 'if you don't get me off this beastly cold table.'

He convalesced rapidly on board the *Dauntless*, where he occupied a cabin eagerly vacated by one of the junior officers. During the voyage up the Red Sea, to Suez, and then through the sunny Mediterranean, he heard in detail how the German crew had fought like caged rats till the last man was down. Only ten had been taken alive, overpowered in a hand-to-hand struggle. Since their capture they had maintained a sullen silence when questioned about the *Cocos* and her exploits. They would be taken to England and tried. The *Cocos* had been taken in tow by one of the transports, and Crane occasionally saw her when, in the latter days of the voyage, he was wheeled out on deck by his nurse, to be lionised by men and officers alike.

The following is taken from a leading London paper of 10th September 1915:

'The Victoria Cross has been awarded to Mr John Crane for his brilliant services leading up to the capture of the German privateer *Cocos*, in the Indian Ocean, last July. The details of this gallant exploit must still be fresh in the minds of our readers. The captured members of the *Cocos's* crew have been tried, sentenced as pirates, and hanged. Needless to say, nothing could be found to connect them directly with

the German Government. The men stoutly maintained that they were acting on their own initiative; that their boat was equipped by private parties from motives of patriotism. Nor could any directly incriminating evidence be found aboard the ship. Trust German "thoroughness" for that. The men went to their death unmoved.

'However, thanks to the information uncovered by Mr Crane, a second vessel of similar character has been seized on the coast of Borneo, where she was trying to replenish her fuel-supply, and was disabled by long-range fire.

'Mr Crane has entirely recovered from the wounds sustained in his memorable adventure, and the Foreign Office has put in a request for his services, as he is too valuable a man to waste his time over a drafting-board in the Navy Department.

'It is a source of great pleasure to realise that England still produces men who are able to face the supreme efforts of Germany's much-vaunted "military preparation and thoroughness," and, single-handed, set their efforts at naught. Both England and Australia owe a debt of deep gratitude to Mr Crane for services that called for resource, ability, and cool courage to a very extraordinary degree. We take pleasure in extending our felicitations.'

THE END.

THE STORY OF THE 'EMDEN.'

By TAFFRAIL, Author of *The Decoy*, *The Outer Patrol*, *An Eye for an Eye*, *The Bad Hat*, &c.

THE *Emden*, a small cruiser of over three thousand five hundred tons displacement, armed with twelve 4.1-inch guns, and capable of a speed of about 24.5 knots, was one of the squadron at Tsing-tau, the German port in north China, on the commencement of hostilities. On the outbreak of war Admiral von Spee, the Commander-in-Chief, was absent in southern waters with the *Scharnhorst*, *Gneisenau*, and one other ship. The squadron from the north, however, joined up with him, and it was not until about the middle of August that the *Emden* was finally detached, with orders to do what damage she could to the Allied trade in Eastern waters.

Her captain, Von Müller, undoubtedly a consummate seaman and a brave man, the son, it is said, of an English mother and the husband of an English wife, was eminently fitted for the difficult rôle he had to play; and the story of the *Emden's* short but eventful career, and of her final destruction by H.M.A.S. *Sydney*, will never be forgotten.

According to one account, Von Müller's adventures started soon after leaving Tsing-tau. He realised that he might meet one of the vessels of the Japanese squadron outside, though as yet that country had not declared war upon Germany.

Still, he had no wish for his ship to be shadowed and her movements reported to the British; so, before sailing, he had had his vessel disguised as a British light cruiser by providing her with a dummy fourth funnel of canvas and wood, and by displaying the white ensign. Within a few hours of sailing, the story goes, he actually did meet a Japanese armoured cruiser, a ship which could have blown him out of the water with one broadside; but the Japanese vessel, satisfied that the *Emden* was what she purported to be, suffered her to pass unmolested and unreported.

For the next six weeks the *Emden's* movements were shrouded in obscurity, and it was not till 10th September that she suddenly reappeared in the Bay of Bengal. Here, between the 10th and 14th of the month, she captured seven large merchantmen, of which six were sunk, and the other sent into Calcutta with the crews. On the 20th of September the raider was reported to be in the neighbourhood of Rangoon; while two days later she suddenly appeared off Madras after dark, and, using her searchlights, fired one hundred and twenty-five shells into the town. Some oil-tanks were set ablaze and a few natives were killed, but very little other damage was done; and presently, when the shore batteries

returned her fire, she extinguished her lights and vanished in the night. On sailing, Von Müller purposely steered to the north-eastward to give the impression that he was making for Calcutta; but on getting out of sight of land he altered course to the southward along the east coast of Ceylon.

The presence of the hostile cruiser in Indian waters had caused no little alarm and anxiety amongst shipowners and insurance brokers, and all the British and Allied men-of-war in the vicinity were soon set to work to hunt her down. But at first searching for a single small ship in that vast area of ocean was rather like looking for the proverbial needle in a haystack, for Von Müller was an adept at covering his tracks, never carried out two successive raids in any one locality, and made full use of his wireless telegraphy in determining the positions and movements of his pursuers and victims.

Between 25th and 30th September he sank four more ships to the southward of Ceylon, the collier *Buresk* was captured, and one other vessel was liberated with the crews of the remainder. It was during this period that a British merchantman is said to have been in communication with the *Emden* herself by wireless telegraphy, quite unaware whom she was talking to. 'Have you any news of the *Emden*?' she is supposed to have asked. 'Am I steering a safe course?' 'I am IT!' eventually answered the German with grim humour after further conversation, and shortly afterwards overhauled and sank the inquisitive questioner. On 15th October the British cruiser *Yarmouth* sank the German Hamburg-America liner *Markomannia* off Sumatra, and captured the Greek collier *Pontoporos*, which was in company with her. This last vessel, full of coal, had previously been commandeered by the *Emden* against the will of the Greek captain, and was subsequently released by us; but both ships had been reported as accompanying the raider, and were, in fact, two of the craft upon which she relied for her stores and coal.

After 30th September, however, the *Emden* herself had again disappeared, and until 20th October her movements were unknown to the outside world. From a diary kept by one of her petty officers, however, it is known that she visited Diego Garcia, an unfrequented island in the middle of the Indian Ocean about one thousand miles to the south-south-eastward of Ceylon, on 10th October, and that she spent the day replenishing her depleted bunkers. The spot was well chosen, for none of the islanders were aware that war had been declared, while the only means of communication with the outside world is by a three-monthly steamer. The inhabitants, though British subjects, were treated kindly, and the diary states that the cruiser's engineers even repaired the local motor-boat, and that they were given baskets of fish and coco-nuts in return for their labour.

The rest of the time, as the weather was fine, was probably spent at sea in the vicinity cleaning the boilers and overhauling the engines; but on 20th October the *Emden* made another dash out to the well-traversed trade route midway between India and Africa. Here she sank five more steamers, captured another collier, and released a seventh vessel with the crews.

Having done this, Von Müller must have realised that the Indian Ocean would soon be too hot to hold him; so, with his usual cunning, he doubled back to the eastward, entered the Strait of Malacca, and at dawn on 28th October suddenly appeared off the British port of Penang. His arrival was utterly unexpected, and here it was that he brought off the most audacious and amazing exploit of his career.

Lying at anchor in the harbour was the Russian light cruiser *Jemtchug*, one of the vessels which had fought in the battle of the Sea of Japan in May 1905. The *Emden* arrived off the harbour in the gray half-light of dawn, when a thick mist overhung the water. She knew the British cruiser *Yarmouth* was not very far off, and disguised herself as that ship by hoisting her dummy fourth funnel and displaying British colours, and, steaming on into the anchorage without exciting suspicion, is said to have replied to the *Jemtchug's* challenge by saying she was the *Yarmouth*. When she was about six hundred yards from the hapless and unsuspecting Russian, the white ensign came down with a run, and the black-crossed German flag fluttered out in its place. At practically the same instant a torpedo was fired. The range was so short that a miss was impossible, and the weapon struck the *Jemtchug* amidships and exploded. A second torpedo was discharged, and the unfortunate ship heeled over rapidly and began to sink. Then the inhabitants of Penang were awakened by the roar of guns, and sheet after sheet of orange flame broke out from the *Emden's* gray sides as her quick-firers poured shell into her already stricken adversary. The *Jemtchug's* decks were soon littered with dead and dying, for most of her men were asleep down below, and rushed swarming on deck when the shock of the first torpedo explosion came. The watch on deck made valiant efforts to work the guns and return the fire, but their gallantry was useless. The surprise had been so complete that they had no chance. They were mowed down in heaps, and the terrific close-range bombardment continued until the *Jemtchug* heeled over and sank. Then her destroyer turned and steamed rapidly from the harbour.

But the tale of destruction was not yet complete. The French destroyer *Mousquet*, a craft of three hundred and three tons, twenty-eight knots speed, armed with two torpedo-tubes and five small guns, had been patrolling outside the harbour, and had apparently sighted the *Emden* on her way in; but, deceived by her appearance, she

had apparently mistaken her for a British cruiser. Soon afterwards, hearing the sound of guns, she came hurrying back, and sighted the raider a few miles outside the harbour. The *Emden* sighted the destroyer at much the same time as the Frenchman saw her, and promptly opened fire on the *Mousquet* at a range of three thousand eight hundred yards. The gallant little destroyer replied with her light guns, and endeavoured to use her torpedoes, but without success; for the German high-explosive shells swept her decks and perforated her thin hull, until she eventually sank by the stern with her colours still flying. Thirty-six of her men were rescued by the *Emden*, which then steamed out into the Indian Ocean at full speed.

Throughout this affair Von Müller had behaved according to the usages of war, though at first it might be thought that he acted in an underhand manner in approaching a hostile port displaying false colours and with his ship disguised. International law, however, lays it down that a ship may not attack under any flag but her own, and the German took the precaution of hoisting German colours before firing her first torpedo at the *Jemtechug*. In war, too, the disguising of a ship for the purpose of misleading an enemy has always been perfectly legitimate.

For thirteen days after the Penang affair the *Emden* disappeared; but early on the morning of 9th November, the *Sydney*, Captain John C. T. Glossop, then on convoy duty in the vicinity of the Cocos Keeling Islands—a group of coral islands in the Indian Ocean well to the southward of Sumatra—received a wireless message from the station there reporting a strange man-of-war off the entrance. It was the *Emden* again; and with her imitation fourth funnel rigged, and flying no colours, she had appeared off the islands at daybreak. According to personal narratives which have since appeared in the newspapers, it would seem that the dummy funnel of canvas and wood was seen flapping in the wind, and so established the raider's identity; upon which the wireless and cable operators promptly despatched the wireless message giving the news, and informed the neighbouring cable-stations that they were about to be raided.

Whether or not this is true is not known; but at 7.30 A.M. the *Emden* landed an armed party with machine-guns, who, without molesting or ill-treating the inhabitants, proceeded to wreck the wireless station and instruments with gun-cotton charges and flogging-hammers, and to cut the shore ends of the telegraph cables passing through the islands. The cable-operators, however, realising that a raid was by no means unlikely, had placed dummy cables to mislead the enemy, and had buried a spare set of instruments. The consequence was that though the wireless installation was completely demolished, the mast blown down, and the cable instruments in place

shattered, only one dummy cable and the Perth cable were actually cut, while the other two cables, to Batavia and Rodriguez, were left undamaged. The hidden instruments, moreover, were never unearthed; and having, as they thought, completed their work of destruction, the *Emden's* men then set about commandeering supplies.

At about 9.20 A.M., while this work was still in progress, the cruiser blew her siren to recall her men. Soon afterwards a cloud of smoke was seen on the horizon, and presently this resolved itself into the *Sydney*, steaming toward the island at twenty knots. Von Müller, leaving his party ashore, at once proceeded to meet her, and soon afterwards fired the first shot of the engagement. The *Sydney* replied, and to start with the firing on both sides was very accurate. The Australian ship, however, being the faster vessel, armed with the heavier guns, could choose her own range for fighting, and steaming to and fro across the bows of her opponent, poured in a heavy fire without receiving much punishment in return. The effect of her 6-inch lyddite shells must have been appalling, for the raider's fire slackened very rapidly, and before long her foremost funnel and foremast were shot away. Then a bad fire broke out in the stern, and the second and third funnels fell. But even then Von Müller did not intend to surrender his ship, though, overmatched as he was, he certainly had a justifiable excuse for doing so; and at eleven o'clock, with his decks covered with dead and wounded, and his vessel little more than a floating wreck, he turned for the beach at North Keeling Island. At about 11.20 she struck the coral-reef with a crash, blazing furiously, but with her colours still flying. The *Sydney* approached, gave her a couple more broadsides to finish her off, and then steamed away in pursuit of a merchant-ship which had hove in sight during the action.

This vessel was the collier *Buresk*, which had been captured by the *Emden* at the end of September, and from which she had doubtless intended to replenish her coal during her stay at Keeling Cocos. But when the *Sydney* came up with her it was found that she had been badly damaged by her prize crew and was in a sinking condition; so Captain Glossop removed the men, fired a few shells into her to expedite the foundering, and then returned to the *Emden* and asked by signal if she surrendered. No reply was instantly forthcoming; but after another brief bombardment the German hauled down her colours and showed the white flag. She could do little else; her career was at an end.

Meanwhile the three German officers and forty men who had landed on the other island had seen their ship steam away to engage the *Sydney*, and, after watching the preliminary stages of the action and guessing what the result would be, had seized and provisioned the 70-ton schooner

Ayesha, belonging to Mr Ross, the owner of the islands. They had with them four Maxim guns and ammunition, and sailed at 6 P.M., while the *Sydney* was still absent at North Keeling. The subsequent adventures of this party must have provided excellent material for a most interesting book, for, after crossing the Indian Ocean under sail, the schooner eventually arrived at the Turkish port of Jeddah, in the Red Sea. Here her crew left her and went ashore, and after an overland journey through Asia Minor, with many adventures, including several attacks by bands of wandering Arabs, eventually arrived in Constantinople.

Early on 10th November, the day following the engagement, the *Sydney* set about succouring the *Emden's* wounded. Captain Von Müller himself was unhurt, and after receiving a promise from him to the effect that the Germans would not attempt to damage his ship, Captain Glossop embarked all the survivors. The work of transporting the wounded was a very difficult task, for the heavy swell on the reef made it dangerous for boats to go alongside the stranded raider. Some of the crew had managed to get ashore in spite of the surf; and it was here, it is said, that several of the more badly wounded, unable to help themselves, were attacked by the enormous land-crabs with which the islands abound. The story has often been put down as untrue; but from personal experience of Keeling Cocos, the writer can affirm that the crabs, ferocious-looking creatures a foot to eighteen inches across, with large claws strong enough to break through the shell of a ripe coco-nut, are quite capable of attacking a wounded man who is unable to drive them off.

The state of some of the *Emden's* wounded was deplorable. Already many of their hurts were gangrenous; but with infinite care and no little risk they were all taken on board the *Sydney*, where the doctor, assisted by the surgeon and some assistants from the cable station, did all he could to alleviate their sufferings. Over one hundred officers and men of the *Emden* had been killed during the action, while fully fifty more had been wounded, and of these several died subsequently.

The ship herself was in a terrible state. All three funnels and the foremast had fallen, while superstructure, boats, deck fittings, and hull were riddled through and through with high-explosive shell splinters. The *Sydney's* casualties were comparatively light, only three men being killed and fifteen wounded, and they all occurred at the start of the engagement. The ship was only hit ten times, and was barely damaged.

The details of the two vessels were as follows: *Sydney*—5440 tons, 25·5 knots, nine 6-inch guns, four 3-pounders; *Emden*—3544 tons, 24·5 knots, twelve 4·1-inch guns. From this it will be seen that the *Sydney* had a great advantage,

particularly as her superior speed and heavier guns enabled her to keep off to a range at which the German's weapons could inflict little damage.

But Von Müller, overmatched as he was, fought his ship very gallantly, and throughout the whole of his career he had behaved in what, for want of a better word, we may call a thoroughly gentlemanly manner. He never took life unnecessarily, and was always courteous and considerate toward his victims; and when the Admiralty gave orders that he and his officers were to be accorded all the honours of war, and were to be allowed to retain their swords, their lordships only voiced the sentiments of the British public, in whom a love of fairplay is innate. Captain Von Müller was a 'sportsman.' His exploits were rather akin to those of the celebrated Lord Cochrane; and in carrying on his war against British commerce he ran daily risks of being brought to action and destroyed by a superior force, while all along he must have realised that his eventual capture was only a matter of time. He did his work well, too well from our point of view; but, enemy though he was, his sporting behaviour rather appealed to the hearts of British people.

The *Sydney* rendered a great service in ridding the sea of the notorious raider, and the congratulatory message from the First Lord of the Admiralty—'Warmest congratulations on the brilliant entry of the Australian navy into the war, and the signal service rendered to the Allied cause and to peaceful commerce by the destruction of the *Emden*'—was thoroughly well deserved, more so than ever because many of the *Sydney's* men were Australian seamen, who behaved magnificently under fire.

The news of the *Emden's* destruction was received with great acclamation at Lloyd's and by shipowners generally, for her successful forays had put the premiums up and had occasioned no little concern on the insurance markets. During her comparatively brief career she sank vessels worth about six hundred and fifty thousand pounds, carrying cargoes to the approximate value of three millions sterling; and this result only shows what an enormous amount of damage could have been done on our trade routes if the Admiralty methods of dealing with hostile commerce destroyers had not been so effective and efficient.

It is believed that the Commonwealth Government has recently accepted a tender for the salvage of the *Emden* and her removal to Australia. If the venture is a success, Australia will have a monument of which she may well be proud; for, if it does nothing else, it will show that her home-bred seamen are as capable of giving as good an account of themselves in action as are her gallant troops now adding to their already fine record in the Gallipoli Peninsula.

WITH THE LEGION.

A SKETCH.

By VERE SHORTT, Author of *Lost Sheep*.

'NO. 3 company will parade in half-an-hour from now, *en état de partir*, a hundred and eighty rounds of ball cartridge to be carried by each man. The company will proceed to Douargala, to join a flying column under Commandant Sevonikoff. The lieutenants of No. 3 company will report themselves for duty immediately to Captain Rodriguez.' Then, his message delivered, the orderly officer became his unofficial self again. '*Tenez, mes amis*, you're in luck this time. It's quite a big business, or at least it would be a big business if the country wasn't in a profound state of official peace. There's been a big smash up at El Zaïr. The Touaregs came in this afternoon, rushed the place, killed off every man they could find, and are off to the desert with the loot and the women. A *sous-officier* of the Goumiers [Algerian yeomanry] has just sent on the report that they have camped about ten miles out of El Zaïr, and they've got their tents up and the camels hobbled. That means they'll stay there at least twelve hours. And there's a holy lot of them, too. It only took about three hundred of them to clear out El Zaïr, and since then they've been joined by about seven hundred more, and the last lot are quite fresh, and spoiling for a fight. The *sous-officier* says that they are El Roumi's men, and in that case they won't try to get away, but will stand and make a fight of it. It ought to be a really pretty little affair. Pity we haven't any cavalry at Douargala! The nearest thing we have that way is a *peloton* of mounted legion; but that ought to be enough to round up M. El Roumi. Well, you gentlemen had better get ready *tout de suite*. The company starts in half-an-hour, and the rest of us will come to give you a send off. *Au revoir, mes amis!*'

As Shelton, the English lieutenant of No. 3 company, passed the quarters of his company on his way to his own he could hear the ordered bustle of disciplined men in haste, and over the noise caught the sound of the Legion's hymn, '*Le sac, ma foi, toujours au dos!*' and then the bark of a *sous-officier's* voice demanding less noise. A quarter of an hour later, when he came on the parade-ground, the men of his company were standing in silent ranks, looking like ghosts under the Algerian moon in their white campaigning kit. There were a few minutes of inspection, the ammunition was distributed, and then the company moved off at the regulation Legion pace of four miles an hour.

Shelton was in command of No. 2 *peloton*, or half-company; while the adjutant, or company

sergeant-major, a Corsican, acted as his second lieutenant. The other *peloton* was commanded by two lieutenants, one a Belgian and the other a Frenchman. At the head of the company rode Captain Rodriguez, a Spaniard, on his old white Arab horse. The sand muffled the footfalls of the two hundred and fifty men of the company, and again Shelton thought how ghostly the whole scene appeared, and the thought came across his mind, 'I wonder how many of us *will* be ghosts this time to-morrow?' But he dismissed it with a half-laugh. Life in the Foreign Legion is not one which lends itself to introspection. To the legionary, officer or man, life is lived from day to day; and for work or rest, march or camp, death or life, he has one formula—'*C'est la Légion!*'

Then Captain Rodriguez turned in his saddle and shouted, '*À volonté!*' ('March at ease!'), and the sound of voices began to rise from the ranks. The men had fifteen miles of a march in front of them, with probably a hard fight on top of it; but they swung along under their eighty-pound packs as if they were returning from drill. They were in high spirits—the legionary always is at the prospect of active service, and the men knew from the issue of ball cartridge that this was no ordinary promenade. Jests in many tongues began to fly, and then from the head of the column rose an old Legion song.

As Shelton swung along on the flank of his half-company, the adjutant drew level with him, and remarked with a half-salute, 'The men are in good spirits to-night, *mon lieutenant*.'

Shelton laughed a little. 'They appear to be,' he said; 'the prospect of fighting always seems to put a legionary in better temper than anything else you can name. Well, I hope we get it. Things have been slow enough, in all conscience, since I joined the Legion.'

The Corsican shrugged his shoulders. 'What will you, my lieutenant?' he answered. 'These are not the old days. *Then* we had an affair of this kind about once a month. Now we are lucky if we get a "fantasia" once in a year. The *Arbis* have had their lesson from the Legion—yes, *bien sûr*, they have had their lesson—and they have profited by it.'

Shelton smiled. 'Yes,' he said, 'I've heard of the Legion's "schooling" of the *Arbis*, and seen souvenirs of it too—I mean those tobacco-pouches made of the skin of a woman's breast, and that sort of thing. Well, I suppose it was necessary; but it seems a bit drastic.'

The Corsican looked at Shelton, and spoke slowly. 'Yes, my lieutenant,' he said, 'it *was*

necessary. With respect to you, you are a new-comer to the Legion, and have never seen what we old soldiers of the army of Africa have. I remember my first fight, when I was a "*bleu*" [recruit]. I have seen things since then, but I will never forget that. There had been a fight in the desert, and we had a company practically wiped out—all except half-a-dozen men, who were taken prisoners. Well, we found their bodies after the Arbis had finished with them. Do you know what they had done to these prisoners?'

Shelton shook his head.

'They had cut off their lips, and noses, and eyelids, and hands and feet, and rubbed salt into the wounds, and pegged them down face upward in the sun. One of these men was my comrade. Yes, there was a payment—oh yes, a payment!—if a quick, clean death from bullet or bayonet can pay for what our men suffered before they died; and these fat, comfortable bourgeois at home in France talked of "atrocities" on natives. My lieutenant, I swear to you that if I could have had my way I would not have left an Arab alive in Africa. Men and women? Devils from hell! No, if ever you are in a tight corner in this country, remember the Legion's proverb: "The last bullet for yourself, and blow out your brains before you let the Arbis take you!" *Eh bien*, here are the lights of Douargala, and we shall be there in another twenty minutes;' and with another salute the Corsican fell back to his section.

As they entered the dusty drill-ground an officer rode forward and exchanged a few words with Captain Rodriguez, and the latter saluted, turned in his saddle, and halted his command. 'The company will march in two hours from now,' he said; 'in the meanwhile get what rest you can, and attend to your footgear. A ration of coffee and bread will be distributed. *Rompez!*' ('Dismiss!').

Shelton saw his half-company settled down, and joined the other officers of his company to learn the plans for the day's march. Captain Rodriguez was in consultation with the *chef de bataillon*; and Des Barres, the French lieutenant, greeted Shelton with a friendly gesture. 'We march in two hours from now, *mon vieux*,' he explained. 'We take two companies—ours and one from here—a company of Goumiers and half-a-company of mounted Legion—just on a thousand men altogether. It ought to be enough; but I wish that they would leave the Goumiers behind. The Legion want no help from native troops; and in any case these chaps are just raw levies, and none too steady. Brave? Oh yes, I grant you; but—oh, well, I have nothing to do with it. It is now four o'clock, and we march at six. We could strike the Arbis at midday; but the commandant is sure to give the men a couple of hours' rest, and they'll want it if these beggars are El Roumi's

men. You know he was a native officer in *Les Homards* [native cavalry] before he went back to his people, and he knows our ways. If M. El Roumi waits for us, it will be because he has a little surprise for us up his sleeve. I don't quite understand the motive of this raid, unless, as I think, it is a deliberate "draw" for us. El Roumi may be playing for a stake of his own; and, if he is, nothing would give him more prestige than a successful show against us. Of course it may be just devilment, or the younger men may have taken the bit in their teeth. In any case, we shall know one way or the other before to-morrow. Now I go to repose my feet, and I advise you to do the same. *À bientôt, mes amis!*'

Two hours afterwards Shelton stood beside his company on the dusty parade-ground, and saluted as the *chef de bataillon* rode along the line. Then the command, '*À vos rangs—fixe!*' ('Attention!'), rang out, and within a few minutes the little column was on the march. The advance guard and the flankers were formed by the half-company of mounted Legion, while Goumiers brought up the rear. The men were marching as only the Foreign Legion can march, with a steady effortless stride which can be kept up for hours, and which eats up the miles at the rate of four to the hour. At the end of every hour came the order, '*Halte! Rompez! Repos!*' and the column broke into chattering, smoking groups. Then came the order, '*Fixe! En route!*' and it swung off again. This is the invariable order of march of the Foreign Legion—one hour's march, ten minutes' rest; and the distance covered is officially supposed to be thirty miles a day, but as a matter of fact is usually considerably more. No questions are asked in the Legion as to how a man marches; but march he must, or die. If a man straggles in the desert, he does so in the sure and certain knowledge that a slow and agonising death from thirst, or at the hand of hostile Arabs, awaits him; and as a rule he prefers death from an overstrained heart to either of these.

As the men moved off after the third halt the adjutant went swiftly up the line to Shelton's side. '*Mon lieutenant*,' he said in a low voice, 'during the *repos* did you notice anything on the left flank?'

Shelton shook his head. 'No,' he said; 'but I was not looking in that direction. Did you?'

The Corsican nodded. 'But yes,' he answered, 'I am almost certain that I saw a man on a camel against the sky on the high ground—over *there*, my lieutenant;' and he pointed.

Shelton looked in the direction named. To the right lay a low range of rolling sandhills, and in front the desert stretched away yellowish-brown, and seemingly flat, but, as Shelton well knew, seamed in all directions with *wadys* (gullies) and folds. With the exception of the column there was no sign of a living thing in

the whole landscape. 'No,' he said, 'I don't see anything, and we are not due to strike the Arbis yet. If you saw anything, it must have been a Bedouin. By Jove, though, there *is* something up! Look! Here comes the advance guard! And who are those behind them?'

The adjutant looked under his hand—one look only—and bounded back to his half-company. The whole face of the desert had changed with the suddenness of a dream landscape. The men of the advance guard were spurring back to the column as fast as their mules could carry them, and at their heels raced a huge confused mass of camels and horses ridden by white figures and tipped with waving steel. Shelton heard the shout, 'Square of companies! fix bayonets!' There was a confused moment or two, and he found himself inside his company square, feeling for the butt of his revolver, and longing for the good, comforting feel of a heavy Webley instead of the light French .320 calibre weapon.

Then he heard Des Barres's voice, '*Parbleu*, we are in the soup this time! Who would have thought that these devils would have come back to meet us? *Mon Dieu!* look! There are more of them, and they are all over the Goumiers!'

It was quite true. The Algerian troops had blown back the first shock of the Touareg flanking charge with a straggling volley, and then their discipline—never very much in evidence—had gone to shreds, and with yells of triumph they had broken rank and hurled themselves on the enemy. The end came quickly. There was another forward surge of camels and horses, swords and spears rose and fell, and nearly a quarter of the French force had been wiped out of existence in a few blood-stained minutes. Then the desert seemed to vomit men, horses, and camels into Shelton's very face, and for the next few minutes his world resolved itself into yellow sand, flying draperies, and snapping, reeking camels. Two men in the front rank went down, and a man on a white horse forced his maddened mount into the gap, a heavy mace going in flying circles round his head. Shelton heard the splintering crash as the Arab got home on a man's forehead, and then the inside of the square was chaos. In the mêlée Shelton found himself jammed against a camel, and was conscious of a pair of blazing eyes with a black veil below them bent toward his. Then a spear-point with a vicious triple-barbed iron shaft behind it licked out straight at his throat. He swung a desperate cut, countered by a parry which nearly dislocated his wrist, and then threw himself sideways almost under the camel's feet to avoid the spear-point. As he went down some one behind almost leaped on top of him, and the Touareg slipped off his camel, coughing blood through his black veil. He had been bayoneted under the armpit by a man behind Shelton. Just as he touched the ground he

pulled himself semi-upright on his knees by Shelton's legs, and the latter saw a long curved dagger in his hand. Then a bayonet slipped into the Touareg's throat, and he subsided face downward on the trodden sand.

The front rank of the square had closed, but the rear rank had faced about to deal with those of the enemy who had broken their way in. Occasionally a man would fire, but in the main it was Lebel bayonet and rifle-butt against two-handed sword and mace. Outside, the Touaregs charged up to the bayonets again and again, only to be blown and pitchforked back. Captain Rodriguez and Lieutenant des Barres were both down, and the inside of the square was a shambles of dead and wounded legionaries, Arabs, and horses. Then the attack ceased as suddenly as it had begun, a respite which the men of the Legion used to dispose scientifically of the few remaining Touaregs inside the square. The enemy seemed to be in full retreat, for no very apparent reason; but as Shelton watched them he saw more white-clad figures among the sandhills on the left.

The adjutant pointed to them. 'When thieves fall out, my lieutenant,' he said, 'honest men come to their own. These are Mauricauds, Moors from across the border. They waited till the Touaregs got well engaged with us, and then swooped down on their camp and looted *their* loot. See how the Touaregs ride! Well, this has been a bad day for the Legion!'

A bad day, indeed, it had been. Out of a force of less than a thousand men over four hundred were dead or mortally wounded, and were put to rest that night in the sands of the desert, where so many brave men of all nations wait for the last reveille. *C'est la Légion*, that Legion which marches, and fights, and dies for the glory of their regiment and of France.

ASHES OF MEMORY.

I NEVER sit in twilight gray
Or gaze across the lea,
But pictures fair before me swim
Of things I used to see.

When fields are clothed with green, and sweet
With Spring's breath in the air,
I think of fields that once I knew
When other Springs were fair.

I see the children at their play,
Such sweet light in their eyes,
And think of strange realms that were mine
Ere I was old or wise.

If lovers dream and laugh and plan
Where silver moonlight gleams,
I think of how, when I was young,
I drank the wine of dreams.

How sweet to me those old dreams now,
And each lost scene how fair,
Since I have gleaned through aging years
My meed of joy and care!

GEORGE LAWRENCE ANDREWS.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

WHO shall demur to the statement that in some respects the Germans are a very admirable people? Nature struggles always for a sort of balance. Against the hideous instincts, tendencies, and dispositions, foul, brutal, horrible, that have been bred in these Huns, and that their leaders have trained into them, it has been difficult to hang an attribute to the other end of the beam that could make a tremble of the scales. Nature might be melancholy at a stupendous failure; for in the scale-pan swinging up in the air are some of the best qualities with which the human kind has been endowed, but they are such as make only for what we may call the technical and the mechanically efficient side of man, and do little for his spirit. On this side of the balance are enterprise, efficiency, thoroughness, and splendid foresight, and it is one of the saddest tragedies in man's history since his first fall that such perfections, exquisite of their kind, should be linked in the same beings with such faults as an empire of devils is loaded with. A piteous incongruity it is! They have failed to understand that the ultimate aim of civilisation is surely the beautifying of life. In the struggle of the Huns with their own selves vice has won, and these qualities of theirs, misapplied and wasted, lie scattered and torn like an exhausted mockery. Persistence might have been added to these attributes. Those who speak and write of the final and complete destruction of Germany and all that is German must overlook the persistence and the foresight. A curious display is being made of these even at this moment, and in strange conditions; and it is a contemplation of this fact that leads one to this restricted admiration of the people. Some of our own have barely ceased to wonder when they hear French words fall from the lips of a Parisian in England. Our travellers, with superb confidence imparted to them by a map of the world that is mostly red with a border of priceless blue round the isles of home, have brazened themselves along with plain English talk, and have used it and no other in the Champs Elysées, in the Corso, and the Alcalá. It has served them better than it should. Hosts have been thoughtful for their own convenience, and accommodating. Selfishness and insularity, stupidity and want of foresight, have made of

the English monoglots. Wise men have tried to make them understand that such a limitation will be bad for them in the future if persisted in. Never have languages been so much advertised as in London in the last few months; never have there been such excellent facilities offered for acquiring them. For a few shillings and not many weeks of effort a person may gain almost any language, and thus obtain the freedom of countries and peoples in a way impossible by other means. It is obvious that languages are necessary in the changed conditions of the world and commerce, now being rapidly formed, as never before, and that the speaking of but a single tongue is a heavy handicap; and it is believed that a good part of young business England is at present engaged in conjugating unfamiliar verbs and absorbing idioms of peculiar formation. Not so much so as you may think. The efforts of inducers have only been moderately successful. Public authorities have classes for the teaching of foreign languages spread all over London, but they are not so popular as they should be. Other special classes managed by educational institutions are less patronised than one would have fancied.

* * *

We do not now pay unnecessary compliments to the Germans; but, as sensible persons, we must recognise that pathetic blend in them of the fiendish with the efficient. What are the Germans doing? There is some reason to believe that such as are not out to be shot on the various fronts are studying foreign languages with great enthusiasm. One would not be surprised to know that in hours of idleness under the sea of such U boats as are left, the officers and crews spend a little time in the study of some language they may possibly not yet have acquired. They appear to know most that are extensively used, for they have never been at a loss for complete vocabulary, grammar, and perfect accent when they have suddenly appeared on the waters and encountered vessels of all nationalities. A Spanish captain who was thus suddenly surprised the other day, and whose vessel was ultimately sent down, reported that upon the moment of his appearance the young German commander addressed him in the smoothest, most sonorous, most excellent Castilian, as if half his time had

been spent in the best social circles and *salons* of Madrid, and the other half in a profound study of the grammar set forward by the Spanish Academy. But for the better support of the suggestion of German foresight, efficiency, and thoroughness, let it be mentioned that the German prisoners in England, in addition to enjoying numerous comforts and conveniences, and sometimes even luxuries, are giving time to perfecting methods of a more decent kind of struggle with the world when this war is done. They are piling up munitions of words. These numerous Germans, prisoners in England, are not perfecting their knowledge of the grammar of their own language, nor do they study the immortal works of Schiller and Goethe. With all their might they are instead grappling Spanish to their German tongues, and they hope and believe that when the war is over, and they become free men again, they will proceed from the camps with a vocabulary nearly as complete as that of a Madrileño and an accent and mode of expression of which a Castilian gentleman might be proud. More than this, they will have especially directed their linguistic studies to the commercial side of things, and know as much Spanish of the business kind as a merchant of Barcelona or Seville. They will be able to write letters in good Spanish business form. Thus, when the war is done, they may proceed from prisoners' camps in England, not home to Hamburg or Berlin, which they have a fear sometimes may be no very pleasant or promising places to visit, but to Spain itself, or, better, to the Argentine and certain other parts of South America. These prisoners have considered the subject, and their fancies have been supported by various official reports and documents with which they have become acquainted. They believe, not without reason, that after the war Spain will be, in relation to other European countries, one of the best situated and most promising, for of all in the middle and south she will have suffered least. Even now she is engaged in an endeavour to establish closer and more active commercial relations with her offshoots in South America, and it is widely believed that the greatest trade boom of the future will be in this part of the world. The British consul at Rosario, which has been called 'the Liverpool of the Argentine,' wrote recently: 'This market is going to be a scene of keen competition between the United Kingdom and the United States. The Americans are showing great activity, and will get the market if it is in any way possible. The next few years are going to be years of revival after a period of depression.' Now all this trade in South America, save that of Brazil, which is done in Portuguese, is carried through by means of the Spanish language, and nothing seems more certain than that after the war there will here be a tremendous commercial struggle between the Americans, the Germans,

and ourselves for that trade. The Germans, and especially the prisoners—who have more time at their disposal and less anxiety about food questions than those in Germany and other parts of Europe—are consequently devoting themselves most assiduously to the learning of Spanish. I am informed that at an internment camp at Holloway they are deeply engaged with their studies of this language; that at the Alexandra Palace they have a Spanish class; and that at other places where they are held in bondage they are applying themselves to the grammar, mastering the subtleties of the use of *ser* and *estar*, the most confusing part of it, and gaining fluency in Spanish speech. They find it, as others may do, not only a comparatively easy language to obtain possession of, but one the study of which is unusually interesting, a smooth and sonorous tongue, one that seems beautiful to those who come as strangers to it. You may recall, perhaps, what the Emperor Charles V. remarked in classifying some of the languages of Europe that he had at his disposal: 'I speak Spanish to my God, Italian to my wife, French to my mistress, and German to my servants and my dogs.' Dr Mahaffy, Provost of Trinity College, Dublin, was once invited to a reception at which the chief guests were the Kaiser and the Queen of Spain, then only recently married. He inquired of the British princess how she fared in her studies of the language of her adopted country, and she responded that she liked Spanish well. He told her this story of Charles V., and there was laughter enough to attract the attention of the Kaiser, who walked across from the other side of the room to inquire what the fine joke might be that produced the mirth. The Provost was good for the emergency. 'I have only had the honour,' said he, 'of knowing her Majesty for some ten minutes, but already we have a secret to conceal.'

* * *

The great Earl of Chesterfield, writer of the famous *Letters to his Son*, would have given shrewd advice to the British people if he were living now. Late at nights, when volumes of such letters make the nicest reading, I have been looking again through these shrewd epistles with all the good and worldly advice of the perfectly equipped gentleman, such as people of these times would benefit by absorbing. This master of secrets of life's success came constantly to the subject of the acquisition of foreign tongues in his counsel to Mr Stanhope. I wonder in what order of importance and value he, if now alive, would place the languages of Europe at this moment. The proper order, of course, changes with times and political circumstances. He would, no doubt, rate French the first, for without good French no man can with satisfaction adventure beyond the blue edging of the isles. Next he would place Spanish, for even in his own day he had a predilection for it. Russian,

to which he used not to refer, because it was of little consequence in his time, would probably be third on his list, and he would perhaps wish that the Russians themselves would enter more into the scheme of the better freedom of the nations among each other by adopting the characters that the others employ. Italian and Portuguese would follow next in his list—leaving German for the moment out of his considerations. How his lordship would marvel if he breathed in these chaotic days and learned that British Cabinet Ministers at the beginning of the war had to set themselves to learn French, and, being called to Paris to consult with statesmen of our Allies, had to converse through interpreters! What would his comment be upon the circumstance that a British Minister in Constantinople could not speak Turkish to the Turks with whom he had to negotiate on matters of supreme importance? He would have enjoined thoroughness, too, and that is what most of the British, in learning languages, lack. ‘Remember,’ says he, ‘that knowing any language imperfectly is very little better than not knowing it at all, people being as unwilling to speak in a language which they do not possess thoroughly as others are to hear them. Your thoughts are cramped, and appear to great disadvantage in any language of which you are not perfect master.’ And he gives advice on study: ‘The shortest and best way of learning a language is to know the roots of it—that is, those original, primitive words of which many other words are made by adding a letter or a preposition to them, or by some such small variation which makes some difference in the sense.’ And he suggests that his son should write down each morning ten words of the language he is learning, out of a dictionary or vocabulary, and get them off by heart, ‘which will go a great way in a year’s time.’ Then he writes in another letter: ‘Were I you, I would learn the Spanish language if there were a Spaniard at Hamburg who could teach me; and then you would be master of all the European languages that are useful; and, in my mind, it is very convenient, if not necessary, for a public man to understand them all, and not to be obliged to have recourse to an interpreter for those papers that chance or business may throw in his way. I learned Spanish when I was older than you, convinced by experience that, in everything possible, it was better to trust to one’s self than to any other body whatsoever. Interpreters, as well as relaters, are often unfaithful, and still oftener incorrect, puzzling, and blundering. In short, let it be your maxim through life to know all you can know yourself, and never to trust implicitly to the information of others. This rule has been of infinite service to me in the course of my life.’ He insists always on the great importance of German and Italian. ‘I recommend to you,’ he writes, ‘to

get as much Italian as you can before you go either to Rome or Naples; and the knowledge of the grammatical part, which you can easily acquire in two or three months, will not only facilitate your progress, but accelerate your perfection in that language when you go to those places where it is generally spoken.’ Again: ‘I hope you not only keep up but improve in your German, for it will be of great use to you when you come into business; and the more so as you will be almost the only Englishman who either can speak or understand it. Pray speak it constantly to all Germans wherever you meet them, and you will meet multitudes of them at Paris. Is Italian now become easy and familiar to you? Can you speak it with the same fluency that you can speak German? You cannot conceive what an advantage it will give you in negotiations to possess Italian, German, and French perfectly, so as to understand all the force and *finesse* of these three languages. If two men of equal talents negotiate together, he who best understands the language in which the negotiation is carried on will infallibly get the better of the other. The signification and the force of one single word is often of great consequence in a treaty, and even in a letter.’

* * *

About London the few German notices one saw displayed in public places have been removed. No longer do we observe upon shop windows any announcement that the servitors within can speak as they do in the stricken Fatherland. It is not necessary now that they should; but what a littleness it is for any in great England to behave in the way of this effacement! The tongue in which Goethe spoke will live; it will flourish, and it will be used extensively in commerce though the empire beyond the Rhine may be dismembered and Hohenzollernism die. As well and with as much reason might we decree the extinction of the majestic music of the great Beethoven. And yet the ignorant of superficial thought and a ridiculous view of patriotism exclaim that the painters with a can of obliterating black should be brought to work upon the notice outside the station at Charing Cross where, with the English and French, the direction ‘*Fahrkarten-Ausgabe*’ is still given, a melancholy reminder that in those distant days of a year and a half ago Germans were free among us, and might with full facility and convenience depart as it pleased them. Last year the London County Council opened a special summer session of evening classes in foreign languages; and, though it was prepared to begin classes in German at thirty-three centres, there were only eighteen students, and one class was enough. But there were thirty new classes and more than a thousand students of French, and eight Russian classes with ninety-six students. And, again, the other day I saw it reported that at the last session of the City of London College

there had been a large influx of students for Russian, which had been met by the establishment of three new classes, the number attending being a hundred and fifty-one; that the French classes had remained normal; and that the entries to the German classes had decreased 70 per cent. The official comment was made that the decrease was understandable, but showed some want of foresight, and ought not to be encouraged. The German language, it was said, will be necessary in business after the war, and unless our people are able to use it Germans must again be employed. Let it be used again; the abstention is so silly and so small. Let us hurt the Germans as much as we can; no patriot of sense is for kissing and being kind as soon as the guns are done with their bloody business; but the German tongue was made by a better Germany than lives to-day, and will go through to a regenerated Germany, not even the British Empire being able to kill the language, or being desirous so to do.

* * *

The young people are learning some languages that will be needed after the war; the middle-aged and those who are even older are reviling the school systems under which they were trained because they were taught conjugations by the yard. To impart a little less of grammar and more useful phrases would seem a too utilitarian way, and somewhat vulgar. Masters and systems must be academic, always academic. They must ignore the circumstance that when nature, instinct, and the desire to grow and acquire get to work on the opening mind of the little child, and first give him speech with a speed and completeness that is the marvel of the grown-up student at classes, the bairns have no grammars. Nature knows her business. In the highly practical language schools in the great centres they now adopt the principle that a little grammar serves for much, and they teach in a few weeks the language that at school, when the mind was young and receptive, was not acquired in several years. If departments and boards and masters only realised that if they could give the boy and girl 'the three R's' and three languages complete for service and fully talkable to go along with them at sixteen years of age, as easily they might, they would be doing magnificent service to their country, and earning

the subsequent gratitude, deep and profound, of their pupils. But, instead, there must too often be the grammars and the conjugations, and in the intervals the binomial theorem and other such gymnastics for the mind—and the examiners.

* * *

Years pass, the tabular conjugations are forgotten, crises and wars come on, the world is upset, and new problems of life and work arise. And then the old pupils, grown up and sedate, with little time to spare and many responsibilities, seek the new classes and learn the languages they should have been taught at school. They find it harder to fasten things in their minds than it used to be in knickerbocker days. It is not ripeness of judgment that is wanted for learning this new way of talk, but the willing memory. Sometimes the task seems impossible, and indeed it is hard enough. But there are encouragements. Is not the waiter at a Piccadilly restaurant ever courteous and careful in five different languages as they may become necessary? And to these elderly students, who need encouragement, one would tell of the achievement of the late Mrs Elizabeth Carter of Deal, which always does seem to be most admirable. There should be a bronze medallion of this good lady of the marvellous linguistic accomplishment placed upon the walls of each of these schools for the grown-ups. Her life was spread through the greater part of the eighteenth century, and in it she mastered Latin, Greek, Hebrew, French, Italian, Spanish, German, Portuguese, and Arabic! Yet these seem to have been but pleasant diversions, for she also took a great interest in astronomy, ancient and modern history, ancient geography, played both the spinet and the German flute, and worked with her needle to the last days of her life, which ended at the age of eighty-nine. And Dr Johnson said, 'My old friend Mrs Carter could make a pudding as well as translate Epictetus from the Greek, and work a handkerchief as well as compose a poem.' A thousand pounds came to her once for a translation of Epictetus. And so those of England who only English know should be heartened, and should go on with their French and their Russian, their Spanish and Italian, and not overlook their German either, for the new time that is coming.

THE DAY OF WRATH.

CHAPTER VII.—*continued.*

THE travelled Briton, to whom the wayside calvary is a familiar object in many a Continental landscape, can seldom pass the twisted, tortured figure on the Cross without a feeling of awe, tempered by insular non-comprehension of the religious motive which thrusts into promi-

nence the most solemn emblem of Christianity in unexpected and often incongruous places. Seen as Dalroy saw it, a hunted fugitive crouching in a ditch, while the Huns who would again destroy Europe were lurching past in thousands within a few feet of where he lay, the image of Christ

crucified had a new and overwhelming significance. It induced a vague uneasiness of spirit, almost a doubt. That very day he had killed four men and gravely wounded a fifth, and there was no shred of compunction in his soul. Yet, in body and mind, he was worthy of his class, and this gray old world has failed to evolve any finer human type than that which is summed up in the phrase, an officer and a gentleman. For the foulest of crimes, either committed or contemplated, he had been forced to use both the scales and the sword of justice; but there was something wholly disturbing and abhorrent in the knowledge that two thousand years after the Great Atonement men professedly Christian should so wantonly disregard every principle that Christ taught and practised and died for. He reflected bitterly that the German soldier, whether officer or private, is enjoined to keep a diary. What sort of record would 'Heinrich,' or Busch, or the three Westphalian lieutenants have left of that day's doings if they had lived and told the truth? The answer to these vexed questionings came with the swift clarity of a lightning-flash. Another rift in the dust-clouds revealed the upper part of the Cross, and the moonbeams shone on a gilded scroll. Dalroy knew his Bible. 'And a superscription also was written over Him in letters of Greek, and Latin, and Hebrew, This is the King of the Jews. And one of the malefactors which were hanged railed on Him, saying, If Thou be Christ, save Thyself and us.'

From that instant one God-fearing Briton, at least, never again allowed the shadow of a doubt to darken his faith in the divine, if inscrutable, purpose. He had passed already through dark and deadly hours, while others were then near at hand; but he was steadfast in doing what he conceived his duty without seeking to interpret the ways of Providence. 'If Thou be Christ?' It was the last taunt of the unbeliever, though the veil of the temple would be rent in twain, and the earth would quake, and the graves be opened, and the bodies of the saints arise and be seen by many!

A harsh command silenced the singing. An officer had reined in his horse, and was demanding the nature of the errand which brought a squad of men from Visé.

'Sergeant Karl Schwartz, Herr Hauptmann,' reported the leader of the party. 'An Englishman, assisted by a miller named Joos and his man, Maertz, has killed three of our officers. He also wounded Herr Leutnant von Huntzel, of the 7th Westphalian Regiment, who has recovered sufficiently to say what happened. The general-major has ordered a strict search. I, being acquainted with the district, am bringing these men to a wood where the rascals may be hiding.'

'Killed three, you say? The fiend take all such *Schweinhunde* and their helpers! Good luck to you.—*Vorwartz!*'

The column moved on. Schwartz, the treacherous barber of Visé, led his men into the lane. There were eleven, all told—hopeless odds, because this gang of hunters was ready for a fight and itching to capture a *verdammte Engländer*. And Joos's 'safe retreat' had been guessed by the spy who knew what every inhabitant of Visé did, who had watched and noted even such a harmless occupation as Léontine's bilberry-picking, who was acquainted with each footpath for miles around, from whose crafty eyes not a cow-byre on any remote farm in the whole country-side was concealed.

This misfortune marked the end, Dalroy thought. But there was a chance of escape, if only for the few remaining hours of the night, and he took it with the same high courage he displayed in going back to the rescue of Irene Beresford in the railway station at Aix. He had a rifle with five rounds in the magazine and one in the chamber. At the worst, he might be able to add another couple of casualties to the formidable total already piled up during the German advance on Liège.

The sabots offered a serious handicap to rapid and silent movement, but he dared not dispense with them, and made shift to follow Schwartz and the others as quietly as might be. He was helped, of course, by the din of the guns and the rustling of the leaves; but there was an open space in the narrow road before it merged in the wood which he could not cross until the Germans were among the trees, and precisely in that locality Schwartz halted his men to explain his project. Try as he might, Dalroy, crouched behind a pollard oak, could not overhear the spy's words. But he smiled when the party went on in Indian file, Schwartz leading, because the enemy was acting just as he hoped the enemy would act.

He did not press close on their heels now, but remained deliberately at the foot of the hill and on the edge of the quarry. Standing erect, with the rifle at the ready, he waited. He could hear nothing, but judged time and distance by counting fifty slow steps. He was right to a fifth of a second. A shot rang out, and was followed instantly by a yell of agony. He saw the flash, and, taking aim somewhat below it, fired six rounds rapidly. A fusillade broke out in the wood, the Germans, like himself, firing at the one flash above and the six beneath. A bullet cut through his blouse on the left shoulder and scorched his skin; but when the magazine was empty he ran straight on for a few yards, turned to the right, stepping with great caution, and threw himself flat behind a rock. As he ran he had refilled the magazine, but now meant using the rifle as a last resource only.

In effect, matters had fallen out exactly as he calculated. Schwartz had blundered into the man-trap set on the path half-way up the cliff, and was shot. The others, lacking a leader, and

stupefied by the firing and the darkness, bolted like so many rabbits to the open road and the moonlight as soon as the seeming attack from the rear ceased.

Uncommon grit was needed to press on through a strange wood at night, up a difficult path bordering a precipice, when each tree might vomit the flame of a gunshot. And these fellows were not cast in heroic mould. Their one thought was to get back the way they came. They were received warmly, too. The passing regiment, hearing the hubbub and seeing the flashes, very reasonably supposed they were being taken in flank by a Belgian force, and blazed away merrily at the first moving objects in sight in that direction.

Dalroy does not know to this day exactly how the battle ended in rear, nor did he care then. He had routed the enemy in his own neighbourhood, and that must suffice. Regaining the path, he sped upward, pausing only to retrieve the pistol which had proved so efficient a sentinel. Judging by the groans and the stertorous breathing which came from among the undergrowth close to the path, Karl Schwartz's services as a spy and guide were lost to the great cause of *Kultur*. Dalroy did not bother about the wretch.

He pressed on, and reached the plateau above the quarry. The clearing was now flooded with moonlight, and the doorway of the hut was plainly visible. Jan Maertz was not at his post, but this was not surprising, as he would surely have joined old Joos and the terrified women at the first sounds of the firing.

'Liège!' said Dalroy, speaking loudly enough for any one in the hut to hear. There was no answer. 'Liège!' he cried again, with a certain foreboding that things had gone awry, and dreading lest the precious respite he had secured might be wasted irretrievably.

But the hut was empty, and he realised that he might grope like a blind man for hours in the depths of the wood. The one-sided battle which had broken out in the front of the calvary had died down. He guessed what had happened, the blunder, the frenzied explanations, and their sequel in a quick decision to detach a company and surround the wood.

In his exasperation he forgot the silent figure surveying the scene at the cross-roads, and swore like a very natural man, for he was now utterly at a loss what to do or where to go.

(Continued on page 160.)

MR JACOB OF SIMLA. A MODERN WONDER-WORKER.

By REGINALD SPAN.

IT is not generally known that the late Marion Crawford, in his remarkable novel, *Mr Isaacs*, took as his hero a living person; but such was indeed the case. 'Mr Isaacs' was none other than Mr Jacob of Simla, who was famous throughout India for his extraordinary powers and fascinating personality.

During his travels in India the novelist met Mr Jacob, and became intimately acquainted with him, and was so deeply impressed with his wonderful personality that when he returned to England he wrote a book about him. This book laid the foundation of Marion Crawford's literary reputation. It sold well, because it dealt with a comparatively unknown phase of Eastern life and character. Everybody of any note in India knew Mr Jacob, and his bungalow at Simla became the rendezvous of many distinguished personages, as every Anglo-Indian of position who visited the social capital of the country made it his business to call upon the famous wonder-worker. As soon return from India and say you had not seen the Taj Mahal as come home and confess you had not met Mr Jacob of Simla. In addition to being the hero of Marion Crawford's novel, Mr Jacob figures as Lurgan Sahib in Rudyard Kipling's *Kim*. Altogether, he has inspired no fewer than six books.

Mr Jacob is a human mystery, and was, in the zenith of his power, the wonder of India. No

one has been able to solve the amazing riddle of his personality or give a satisfactory explanation of the remarkable things he has done. It was generally supposed that he was a high-caste Brahmin; but in reality he was a Turk by birth. Long residence in India had given him the appearance and nature of a native. A Yoghi by religious persuasion, and an 'Adept' by profession, he presented as interesting a subject for study as it would be possible to find in any part of the world.

Born in Constantinople in the humblest circumstances, his boyhood was passed in abject poverty. Later he became the servant of a rich pasha, who took an interest in him, and encouraged his inordinate love of study by giving him all the books he desired and every facility for obtaining knowledge. At this time he acquired a deep acquaintance with Oriental lore which was later to make him a leading figure in Anglo-Indian society at Simla. On the death of his master he decided to make the pilgrimage to Mecca, being deeply read in the rites of Mohammedanism, able to recite the Koran from beginning to end, and conversant with all the practices of the Moslem religion. He reached his destination safely, and later, after many hardships, found himself in Bombay without money, and nothing but his knowledge of Eastern languages to help him. This was sufficient, however, to obtain him

employment at the Court of the Nizam of Hyderabad, where he remained for some time; and, having saved money, he moved to Delhi, where he started business as a dealer in precious stones. In a few years Jacob amassed a small fortune; and then, extending his business, he established himself at Simla, where he rose to be the first dealer in the famous mart, and was patronised by all the *élite* of Anglo-Indian society, who purchased his goods and visited him at his house. He was lavish with his hospitality and munificent in his generosity. His rooms were furnished in the most gorgeous Oriental style, and full of priceless ornaments and jewels. Not only was he extremely rich, but there was something very attractive about the man which drew everybody who was anybody to his doors. Viceroy, governors, the leading members of the civil and military services, and society generally, flocked to see him. He soon became known as one who could perform 'miracles,' and everybody wanted to see his 'tricks' (as they were termed), and try to find out how they were done. All Simla was startled and mystified by his extraordinary performances; and though many considered them vulgar impositions, they were bound to admit that what they saw was quite impossible of explanation.

A record of many of Mr Jacob's 'magical' feats has been kept. One of the most remarkable is related in *The Autobiography of a Magician*, and was personally witnessed by the author, who vouches for the absolute veracity and accuracy of his account. This gentleman was invited to a dinner-party at Mr Jacob's bungalow, which was situated about two miles from his own abode, and he and a well-known General drove there together. Several other military officers were also guests. After dinner, when they were smoking, General B. asked Mr Jacob to show them some of his tricks. Their host did not appear to like the word 'trick,' but simply said, 'Yes, I'll show you a trick!' and, turning to a servant, told him to bring in the sahibs' walking-sticks. Selecting a thick grape-vine stick with a silver band round the handle, he asked, 'Whose is this?' The General replied that it was his; whereupon a glass bowl, similar to those in which goldfish are kept, was placed on the table, some water poured in, and Mr Jacob held the stick upright on its knob for a few moments. After a time they saw numbers of shoots like rootlets issuing from the handle till they filled the bowl and held the stick steady, Jacob standing over it, muttering all the time. A continuous crackling sound was then heard, and young twigs began to appear from the upper part of the stick. These grew rapidly, became covered with leaves, and flowered before their eyes. Then the flowers changed to small bunches of grapes, and in ten minutes from the beginning a fine vine laden with bunches of ripe black Hamburgs stood before them. A

servant carried it round, and they helped themselves. The fruit was declared to be excellent. In case the whole affair might be due to hypnotic delusion, the writer placed half of his bunch in his pocket to see if the grapes would still be there after he left Mr Jacob's house.

The vine was replaced on the table, and covered with a sheet, and in a few minutes was changed back into the General's stick. Many other interesting feats were performed, and the company were filled with amazement; then, as they were about to depart, Mr Jacob requested a few words privately with the writer before he left. They went out on to the veranda and conversed on occult subjects for a few minutes. Mr Jacob then offered to cause him to undergo a special experience which would give him something to think about. His guest replied that that was just what he would like. So Mr Jacob said, 'Shut your eyes and imagine that you are back in your bedroom in your bungalow.' He did so; and after a few seconds Jacob called out, 'Now open your eyes!' He opened his eyes, and found that he was really in his bedroom—two miles in a few seconds! Jacob then told him to shut his eyes again, and they would rejoin their friends; but this he firmly refused to do, as he thought it might all be hypnotic delusion, and he wanted to see how Jacob would get out of the difficulty. However, the magician simply laughed good-naturedly, and said, 'Well, since you won't come, I must go alone; so good-bye;' and in an instant he had vanished, and the subject of this marvellous feat was left alone. Looking at his watch, as he had done at the commencement of the experiment, he found that the whole affair had not lasted two minutes. He then walked straight out of his bedroom into the dining-room, where he found two of his friends, who were astonished at seeing him, and wanted to know how he had managed to get into his room without their seeing him pass. He then sat down and told them all about it. One of them (Dr S.) asked to see the grapes. Accordingly he felt in his pocket, and there they were sure enough, so he passed them to him. The doctor turned them over suspiciously, smelt them, and finally tasted one. 'They are the real thing, my boy; genuine black English Hamburgs,' he said, and proceeded to devour the lot. 'But where's the *tat*?' exclaimed his other friend. The writer replied that he had forgotten all about it, but supposed he had better send for it. Calling a servant, he told him to go to the stables and send a syce up to Sahib Jacob's bungalow for the *tat*. In a few minutes the bearer returned and said that the *tat* was at that moment safe in his own stable. They stared at one another in amazement, then went out to see for themselves. Sure enough, it was there. *So the horse and cart were also levitated!*

Mr Frederick Heath, a writer of some distinction, who was well acquainted with Mr Jacob, relates the following.

One evening Jacob had made arrangements to hold a *séance* at his house in Simla. He had invited six friends to dinner, and Jacob and his guests were all seated at table, when suddenly Jacob vanished. Behind his chair stood his *kitnagar*, as surprised as the guests at Jacob's disappearance. Only a second before he had been plainly visible to them all, and had been talking to them, yet he had vanished through closed doors. Hardly had the guests recovered from their surprise when Jacob was once more in his seat at the table. When questioned, Jacob merely said that his 'Master,' Ram Lal, had sent for him in order to tell him that the *séance* could not take place that evening. The mysterious Ram Lal, by the way, is also brought into Marion Crawford's novel. Jacob refused to give any explanation of either his disappearance or the postponement of the *séance*; but later he gave Mr Heath the reason for the sudden postponement of the *séance*, though the way in which he was able to leave and return to the table in such a remarkable manner is still a mystery.

The *séance* was postponed by order of Ram Lal, who by some inexplicable means had discovered that one of the guests was not in good health; and as all those who attended Mr Jacob's *séances* had to be in good health, otherwise a *séance* could not be successful, Ram Lal thought it his duty to warn Jacob in time.

On another occasion a *séance* was held at which six of the stoutest sceptics in Simla attended. They were all army officers, and each had seen active service in India. Mr Jacob had put up with the ridicule of these men for a long time, and he was determined to show them that there was something in his powers besides vulgar pretension. He asked one of the officers to give him an account of any battle in which he had taken part. The officer did as requested, and Jacob then said, 'Look at the wall and you will see the battle again.' All turned their eyes to

the spot indicated, and there they saw a living, moving representation of the battle, not unlike a bioscope film. Everything was vividly depicted to the smallest detail; and there, leading a charge, was the face and form of the man who had just related the incident, looking as real as life. The officers were astounded, and evidently believed that their eyes had been bewitched. Another officer mentioned an affair he had been engaged in, but omitted to say anything about his own actions in the battle, where he had distinguished himself by great bravery. His heroism was, however, shown in the picture which followed, and it was known to be quite correct, though Jacob himself was unaware of the part the officer had played in the fight. The officers confessed that they were completely mystified, and became convinced of the genuineness of Jacob's uncanny powers from that evening.

One of this wonder-worker's most extraordinary feats was walking on the water. There was a wide, deep pond in his grounds, on the surface of which Jacob often walked. Crowds of people came to see him do it, and try to discover how the 'trick' was performed; but they were completely baffled, and were obliged to admit in the end that Jacob possessed powers undreamt of in their philosophy.

Other things no less wonderful he is alleged to have done, but they are too numerous to be related here. Gradually he built up a reputation that remains with him to-day. All India knew something of his powers. He was one of the most-talked-of men in that country; but eventually his powers failed him, he lost his wealth, and sank into poverty and obscurity, and to-day he is a broken-down old man, friendless and disappointed, eking out a precarious existence in Bombay, with nothing but memories of a brilliant past to lighten the darkness and dreariness of his life's evening.

LOST IN THE VOSGES.

A SOLDIER'S TALE RETOLD.

By EDWIN L. ARNOLD.

THERE is a world of romance in the backways of campaigning, and a thousand strange things happen in war that are never recorded. I could fill a volume with startling incidents that have either been told to me or actually chanced to myself personally. Here is one of the latter kind, not the most wonderful, but weird enough in its way; at least it seemed so at the time.

It was in the wildest district of the Vosges, and on one of the most dismal nights of the black month of last December. What I, an Englishman, was doing, hungry and alone, at that moment does not matter to the story, and could not be conveniently told if it did. It is sufficient

to say I had been wandering about all day through a wilderness of pine-woods and barren hillsides over which the shadow of war had passed like a blight the week before, and at nightfall found myself hopelessly lost. Friends and shelter were certainly somewhere not far off, but it was a time when no man cared to advertise his whereabouts to possible enemies, and when darkness came it settled down on as forlorn and God-forsaken a waste as ever offended mortal eyes. Worse still, it began to rain, and rain as it only does among mountains; and presently vivid flashes of lightning leapt from the clouds overhead, lighting the sky from verge

to verge, and making every descending raindrop into a strand of golden wire as it fell into the nether gloom of the woods behind. And then the thunder! The sodden ground trembled under it; in the splendour of that giant detonation everything seemed to cringe, and the hundred voices of the storm sank into silence. It numbed the senses, and when at last the tumult died out among the ravines the very rain ran more gently down the slopes, and the wind was hushed in awe, as though it feared to provoke again the subsiding tumult.

It was a night to make you bless the man who invented bedstead and roof-tree; to thank Providence for shelter while you prayed for the homeless. But it looked very much as if neither roof nor bed was going to fall to my lot. There was not a trace of the camp I was in search of, and the miserable woodman's trail I had been following so far grew more and more visionary in the deepening gloom. I clung to it until my instinct told me the camp ought to have been reached long before, and then went back for half a mile to a piece of open ground, whence there was a chance of seeing fires or lanterns, but not a glimpse of either showed. I tried to retrace my steps, and in another mile or so came to the conclusion that a goat would have scorned to call the track I was following a path. I was hopelessly lost in the haunted Vosges. A few minutes' consideration in the partial shelter of a rock convinced me that it was no good standing there all night; so I buttoned up my khaki coat to my chin, for it was cold as well as wet, and plunged forward again. It was nearly an hour later when a momentary break in the clouds showed something that looked like another path going across a patch of rock-strewn grass-land, and a couple of hundred yards up it a shadow that could hardly have been caused by anything but a human habitation. Had it been Buckingham Palace I could scarcely have been better pleased. I hurried through the lonely clearing, and in another minute found myself indeed before a dwelling-place.

It was nothing but a deserted hut, and a small one at that; but it represented welcome shelter. The roof was made of shingles, the walls were of mud, and there was a raised platform of the same material all round, over which the eaves projected. The whole place had a tumble-down and forlorn look in the blackness of the night; but I went up to the porch, determined at least to find out my whereabouts, if nothing more, and called out loudly. There was no response, and after waiting a moment I shouted again. Still no answer; so, pushing open a waist-high hurdle woven with decaying reeds which served as a door, I went inside. It was still as death and black as a coal-mine. Nothing stirred; no one came to meet me; so I struck a match and held it overhead. The light shone on a little room with the

floor littered with dead leaves, and mouldy walls from which a coating of whitewash was peeling in flakes. On the floor were the ashes of a fire, and over beyond them a mud partition separated the main apartment from a smaller one beyond.

There was nothing in the outer room; but, striking another match, I went into the inner compartment, and against the wall, in the dim yellow shine of my lucifer, lay the huddled figure of a man apparently asleep, and wrapped in a rough and very ragged peasant's gray cloak. Bending down, I touched him on the shoulder, and, as he did not move, gave him a shake. He was a small, thin man, and obviously a sound sleeper; and, as there was no response, I gave him a second shake. When this produced no result I took hold of his uncovered hand. It was cold and stiff. I lifted the hood of the cloak from his face, and his staring eyes met mine, but without intelligence. He was dead; and, as I realised the fact with an involuntary start, the rain pattered like feet over the bare ground outside, and a draught of damp air sighing through the hut extinguished my match and left me in funereal darkness.

Covering the poor peasant's face again, I went out and looked into the night. It was very wet and wild, the forest full of sad voices of wind and falling water, all as dismal and uninviting as could be. The clouds in the west seemed a little like breaking, and there was a pale gleam of moonshine on a distant hillside; but all else was gloomy, unbroken solitude; flying storm-clouds overhead, and blacker pine-forests down below; a most grim place at any time, and doubly so at that moment. There might not have come a human being, save myself and the man within, to such a lonely spot once in a year or more. Yet, poor as the hospitality behind me was, it seemed better than wandering about in the abysmal depth of the forest; so I went inside again, and, leaving the hurdle-door open, for the hut smelt very pronouncedly of the dead within, I sat down opposite the opening, making myself as comfortable as possible, with my back to the wall, and, strange as it may seem, quickly began to doze, and presently dropped asleep, and slept for an hour or more.

I dreamt I was at a dinner-party in Paris, and sitting next to a most charming lady, who, in Oriental fashion, kept putting morsels from her own plate upon mine, and then even feeding me with her own fork—the while her diamonds glittered on her bosom, and her silvery laughter made all the other guests stop and look at us—feeding me so fast that I was near to choking. How long this foolish fancy would have gone on I cannot say, but I was still dazzled by the lights and diamonds and merriment about me when suddenly I awoke. I awoke with a start, staring into the chilly blackness, and it was only

after a minute or two that remembrance returned and I knew where I was.

I stared all round, and presently my eyes settled on the doorway. The clouds by this time had broken, and the entrance to the hut—which had been but a faint patch of purple an hour before—was now faintly lit up by the reflection of moonshine on the slope beyond. The forest was still black as the infernal regions, and full of sighs; but what riveted my attention with a terrible fascination was the *doorway*. It was not empty! Squatting on the floor, and leaning against the framing post in a limp, sad attitude, was the dead peasant. I could not believe my eyes. I stared and stared, while my heart began to beat fiercely, and my skin involuntarily to creep. It was he for certain. Who else could it be? There was not another human being within miles of the place. In the dim light I could just make out the stooping round of his shoulders, the bent head, the crooked knees under the iron-gray cloak; and then, as I looked, that head was slowly lifted, and two glowing eyes, burning with a horrible, soulless shine, were turned fixedly upon me. For a moment my own quailed before that remorseless stare; for a moment I was a coward! Then, when my heart had done its first wild beating, my courage came back. I set my teeth in silence, and looked up. The figure had not moved; the eyes were still on me, cold, piercing, inflexible; and outside it was raining again. 'Was it really a ghost? If so, how interesting! How foolish to be afraid!' I said to myself, sitting meanwhile as still as the thing, and struggling with my emotions. Only once before had I seen anything really supernatural.

That happened in an old Devonshire manor-house. I was going up alone to bed about midnight, candle in hand, full of everyday thoughts, and as sober as man could be, when at the top of the ancient oak staircase appeared a little haze of blue light about eighteen inches in diameter. It passed gently to the carved balustrade, and then came floating toward me. I was astonished, but not frightened, and stood back against the wall. Nearer and nearer came the soft glow, going down the woodwork with indescribable gentleness; and when it was but a yard or two away I saw within the rays a lady's hand—a beautiful white hand with jewelled rings—fingering the oak with quiet confidence, just as the hand of a living lady would in like circumstances. It passed me so near that I could almost touch it, and went on till it got to the hall below, where the light evaporated into something like a strand of summer mist! That was actual fact, and as I thought of it now my pulses went back to their normal and my confidence returned.

If this were really the astral of the dead man, what a chance for an interesting conversation! I could not run, even if inclined, for he was in

possession of the doorway. I had my back to the wall in more senses than one, and there was nothing to do but to brave it out, and speak. Suppose he did not understand me? The peasants in the district used a strange dialect, and my French was limited. 'Do ghosts comprehend all languages,' I asked myself, as we stared at each other across the few yards of mud floor, 'or only that which was their own on earth?' It was a curious point which I could not remember to have heard raised before; but as the silence was growing unpleasant I pulled myself together and said in the best French I could muster, 'It is a wet night, comrade.'

The result was most disconcerting. My voice was quite horrible in that chamber of the dead. It was more ghostly than the ghost opposite. As for that ugly *thing*, no sooner did the whisper reach him than a pale red shine rose in his immovable eyes, and at the same time two satanic-looking ears pricked up from the forehead under the cloak-hood. What was it? What could it be? Almost blood-red optics in the grim black setting of the night; ears, horrible, inhuman, where nothing like them ought to be! A ghoul? Of the whole fraternity of the disembodied, that is the thing that has always seemed most damnable, most intolerable, to me! It was more than human nature could stand. I was on my feet in a moment; but even quicker than I got to them the thing was on its own, the gray shawl turned to ragged fur, the glowing orbs to hungry eyes, the thin, bent limbs to beast legs, and a living mountain *wolf* stood between me and the moonlight.

We stared at each other hard for a space; and then, impelled by reckless anger, I sprang forward. The brute disappeared into the darkness at the same moment, and as I plunged out on to the veranda the shadow of a second one slunk into the coverts.

The mystery was solved; the ghost had proved material; but my friend was not done with yet. He had no doubt scented the dead within, and, being astonished to find a living man in such company, had sat down in the doorway to consider the situation. He was still thinking it over when I awoke. With better backing from his companion outside he might have come to a decision quicker, and that would have ended this story before it began. These Vosges wolves are savage and powerful brutes, and when pinched by winter hunger will attack man or beast with equal ferocity. Only a little time before, I remembered as I stood in the darkness trying to catch a sight of the enemy, they had killed a Frenchman I knew personally. Poor fellow! he had started to walk through the snow one evening to the next camp, and as he did not arrive, we went to look for him next day. We found him—all there was to find, and that was not much more than his bloody overcoat, and his boots with his feet still in

them! I could not forget these boots as they lay in the snow, and they loomed up most uncomfortably in my imagination at that moment.

I was not going to turn out of my shelter, however, for any number of wolves; so, going into the hut, I pulled to the rotten, waist-high door; and after spending my last match on another look at the peasant, who, poor chap! was as dead as dead could be, I retired in the outer apartment to my wall, and sitting down, strange as it may seem, soon began to doze once more. This time the lady with the diamonds would not come to me; my sleep was broken by occasional starts of semi-wakefulness, but it continued till the night was far spent, and then I suddenly awoke in earnest.

The square patch of the doorway opposite had changed by now from moonlight purple to gray; the winter dawn was coming. And sharp, clear-cut against that light, as my sleepy eyes opened, they took in a black form that seemed almost to fill the entire space; it was the wolf again. He was on his hind-legs, his front-paws resting on the top of the hurdle door, peering hungrily into the chamber, while the steam of his hot breath rose to the eaves, and its foul aroma came abominably down the draught to me. He was feeling with a back leg for a foothold on the bars. He was coming in!

This time I did not wait, but rose quietly, a short-bladed hunting-knife, my only weapon, gripped in my hand. The wolf saw me, and I heard his teeth snap savagely together with a sound like the shutting of a rabbit-trap. He turned his head away for a moment, probably to look for that cowardly companion outside; then quickly reverting it, fixed those cruel, hard eyes on me, a very basilisk in the chilly twilight of the early dawn. I was cold, hungry, and tired, I had had no food all the previous day, and that stare seemed to be sinking into my soul. For a moment my senses wavered, and as the hut reeled about me I imagined it was truly the dead man who was in the doorway. Then with a gasp and an effort the fancy went again, and as the blood rushed into my face I mastered the fatal wolf-mesmerism, and, first one foot and then the other, moved softly toward the beast. Presently we were not more than four yards apart, and at that distance we stood rigid as statues for a couple of minutes. I must say

such boldness was to the brute's credit, and unusual. Thinking it over afterwards, I have been inclined to believe that he doubted throughout whether I was really alive. He could not see the man inside, the hut smelt very much of the dead, and there was I. Probably fear, hesitation, and hunger possessed him by turns, and saved my life; but now the adventure drew to a climax.

We stared at each other for a time, listening to the beating of each other's hearts, and then I could stand it no more. Suddenly swinging the knife overhead, I threw myself headlong on the figure against the gray. There was a fierce howl, apparently right in my ear, as the blade descended, a crashing of rotten woodwork as the hurdle gave way, and I, and wolf, and woodwork shot out together into the darkness. I was on my feet in an instant, and shook myself clear of the litter. There was blood and fur on the knife; but the ghoul, the prowler, the hunter of sheep and shepherds, was gone!

Then followed two of the coldest and dullest hours I ever experienced, while the December daylight came slowly over the hills. The rain had stopped now, and the sky was clear; but when the fighting flush went from me it was intolerably cold. However, there at least was the day, and behind it—delight of delights—a low gleam of winter sunshine. No man on whom it rose was gladder of the sun that day than I. I went out on to a hillock to get the most of it; and as I stood uncovered in the rays, with every sense high-strung, there presently came to my ears the thin silvery sound of a bugle in the next valley sounding the reveille. It meant friends, warmth, breakfast! I rushed back to the hut and told the dead man that I would have him put out of the way of fangs and claws; then outside again, and did my hair with a pocket-comb at a pool, and tidied myself; and half-an-hour later was in camp. They had steak and chipped potatoes, and coffee—French coffee—in the officers' mess that morning; and you must have starved for twenty-four hours, and shivered all night in a dead man's house, and fought the devil, or something very like him, between starlight and dawn, if you would really understand how good, how surpassing good, these things can be.

THE MONTH: SCIENCE AND ARTS.

EXPLOSIVES FROM COAL.

THE increasing use of the high explosives familiarly known as T.N.T. and T.N.A.—the base of which is toluol or toluene, derived from coal in the course of its distillation into gas—has been responsible for the recent War Office communication to the various local

authorities requesting the temporary abrogation of gas tests. Although the manufacture of coal-gas is carried out in such a thorough manner as to extract every available and commercial by-product, a certain proportion of benzol and toluol associated with the gas has been allowed to pass into the mains in order to improve the lighting and calorific powers. But even these traces are

now to be wrung out for more nationally vital purposes. The domestic and commercial consumption of coal in grates and furnaces is probably the most wasteful method of burning this fuel, inasmuch as in so doing all the valuable by-products are lost. In Germany, following the outbreak of war, all Government concerns, including the railways, were forbidden to burn the raw material. The explosive and liquid fuel products were urgently required, and by forbidding the use of crude coal an outlet was forced for the consumption of the vast accumulation of residue known as coke. The average individual may not realise how great is the dependence placed to-day upon the by-products arising from coal distillation. In Germany, owing to the absence of native mineral oil resources and the impossibility of importing supplies because of the blockade maintained by the British fleet, dependence has to be placed upon the benzol and other liquid inflammables derivable from coal for driving the Diesel motors of the submarines and the high-explosion engines of aircraft and road motor-vehicles. The carbolics are utilised for disinfectants. Cyanogen is used as the medium for the poison-gas war and poison-gas shells; while the toluol, of course, enters into the preparation of the high explosives, as does also the ammonia in the form of sulphate of ammonia, which is adopted as a substitute for saltpetre, supplies of which from Chile are no longer available. In this country the increasing demand for gas for driving machinery as well as for domestic purposes is creating another difficulty. Huge stocks of coke are accumulating at the gasworks, and this residue remains to be cleared. Although coke is utilised in industrial and domestic circles for power and heat purposes, the consumption is by no means so heavy as in other countries, a result due in a great measure to the comparatively low price of the coal. But this latter fuel has now soared to a high figure, and is well-nigh inaccessible to certain classes of the community. On the other hand, the coke is going begging. What is required is the formation of a coke distributing organisation to ensure that adequate supplies may be sent from the districts where it exists in plenty to those where it is difficult to obtain. If this were carried out upon methodical lines it might enable the domestic fuel problem to be eased appreciably. Coke, being the residue of coal after every useful by-product has been extracted, should be available at a low price; and, even when the high charges for transport are paid, it is a fuel which should be purchasable at prices from 50 to 60 per cent. below those of coal. It is admitted that the accumulation of coke in the great gas-producing centres, especially in the Midlands, is attaining serious proportions; but no attempt appears to be made to bring it into more formidable competition with coal as a fuel. A campaign of education, combined with

the elaboration of ways and means of transporting it to the possible centres of consumption, should prove lucrative at the present juncture. As a rule, there is one advantage possessed by coke as compared with coal in matters pertaining to transport: such long hauls as attend the crude mineral are not imperative, so that the expenditure under this head should not be prohibitive. We are a long way behind the Germans in the economic handling of coal and in the distribution of the coke. In Germany the gas-producing works are in close proximity to the coal-fields, while the gas is pumped over long distances through big mains, recalling the economic transport of oil by pipe line in the United States. This practice enables the residue from the retorts to be marketed at a low figure, whereas in some districts in this country at the present time coke is practically as expensive as coal.

AN INGENIOUS COFFEEMAKING POT.

In making coffee the true art is to produce a beverage free from tannic acid. By using the universal coffee-percolator no such apprehensions need be entertained. This device varies in style and design, according to requirements, ranging from the vessel of conventional shape to the urn with which either a spirit-lamp or gas-jet is employed. But in each instance the working principles are identical. Within the percolator is placed a hollow vertical stem or tube, the lower end of which fits into a small conical chamber fitted with a valve, while the upper end terminates in a perforated cup and filter. The coffee, ground but not pulverised, is placed within the perforated cup after the vessel has been charged with cold or lukewarm—not boiling—water to a point below the upper coffee-container. The percolator is then placed into position within the vessel, and the lid closed. The coffee-pot is either placed upon a gas-stove or range to be heated. Owing to the special design of the lower chamber, the water within this receptacle first becomes heated, then, opening the controlling valve, passes up the tube and escapes over the upper end. In its descent the water falls upon the coffee, and finally drops through the perforations into the body of the vessel. Thus one secures a continuous cycle, the water passing from the body of the pot through the heating-chamber, up through the tube, into the coffee, and back again into the vessel, the action being continued until sufficient strength has been extracted from the coffee to impart the desired flavour to the liquid. The pump, as it is called, is absolutely automatic in its action, and the operation is carried out without any danger of the liquid attaining the boiling-point. The liquid is also filtered in the process, so that no clarifying with egg is required. Tannic acid cannot be produced, because the water never boils. Moreover, no steam or aroma escapes from the percolator, because the steam is

condensed within the valve-case, where the process of steam cooking the coffee takes place, so that the aroma is confined to the interior of the pot. With this apparatus, coffee of any desired strength may be obtained in a few minutes; and, owing to the aroma being retained, the quality and flavour of the beverage are considerably enhanced. The pot is designed upon thoroughly hygienic lines, inasmuch as the cooking-chamber, valve, pipe, and perforator may be withdrawn bodily, and taken apart for cleaning.

ESTIMATING DISTANCE AT SEA.

An ingenious method for estimating distance at sea in thick or foggy weather, which has been devised by Professor Joly, is set out in the report of the proceedings of the Royal Society, and is described in *Nature*. As is well known, sound travels at varying velocities according to the media through which it is transmitted. Thus, sound travels more quickly through water than through the air. If aerial and submarine signals are transmitted simultaneously from one point, the former lags behind the latter to the extent of about four and three-tenth seconds per nautical mile. If an approaching vessel picks up the signals, and should make an error of one second in timing the log, she can determine her position within a quarter of a mile. Wireless and submarine signals or wireless and aerial signals may be used. Suppose, for instance, that the faster-moving signals are sent out in groups, the individual signals being despatched at regular intervals—say of one second—and that the first slow-moving signal is always sent out simultaneously with the first rapid-moving signal of a group, the captain of a ship need only count the rapidly moving signals until the first slower-moving signal reaches him in order to ascertain the distance of his ship from the station emitting the signals. In this instance it is not necessary for the navigator to make any actual time measurement on board his ship, because the signals themselves tell him the distance. In the event of a vessel being able to send out a loud, crisp signal simultaneously with a wireless or submarine signal, and should wireless information concerning speed and course also be given, the captains of two approaching vessels are able to ascertain accurately, firstly, whether there is or is not any risk of collision, and, secondly, the point upon the respective courses and the moment when the collision is threatened. The solution of the problem depends upon the circumstance that at each instant the speed of mutual approach is the maximum if the ships are advancing in such a way as to collide. A simple geometrical construction, which by its character is unlikely to involve error, enables the navigator to determine the problem the instant the signals are received.

SUBJUGATING THE TRENCH PLAGUE.

One of the direst penalties of the trenches, and one which is inevitable when large numbers

of men are congregated in confined and limited quarters, and denied the opportunity to remove their clothes at frequent intervals or to partake of a bath, is the visitation and propagation of lice and body vermin. Various attempts to remedy this plague have been made, but few have proved successful. An efficient measure to this end is the simple body-cord which has been evolved by a Scottish chemist. It consists of a flexible length of chemically prepared material of the thickness of a blind-cord, which is worn around the waist next to the skin. Owing to its pliability it sets tightly upon the surface and accommodates itself to the contour of the body. No personal discomfort or inconvenience is caused by its use, while it does not affect the skin, owing to the absence of irritant ingredients in its composition. But it spells death to the unwelcome visitors. It not only destroys the vermin, but renders the body so unpalatable as to prevent them from lodging on the person or underclothing of the wearer for any prolonged period. According to the tests which have been made in the trenches, the cord fulfils all that has been claimed for it, one officer in a Highland regiment who had suffered severely from these marauders having passed twenty-four days in the trenches without suffering a single bite. Seeing that the trench plague is declared by our soldiers to be worse than fighting the enemy, any simple and inexpensive means wherewith it may be successfully combated should be adopted. It may be mentioned that this new curative has received the approval of the medical profession.

ELECTRICITY AND AGRICULTURE.

For some months past the Government has been emphasising the imperative need of increasing our native food-supply, and in this direction the Board of Agriculture has been playing an active part. Many of those who work the land are steeped in conservatism, and have resolutely declined to keep step with progress. This has been largely due to the abundance of rural labour at comparatively low wages. But the war has brought new factors to bear upon the whole problem. It is stated that approximately 20 per cent. of the farm labourers have enlisted, added to which is the increasing cost of living, which has been reflected in the necessity to increase the wages of those who have remained to till the soil. The farming element of the community admits that it is faced to-day with problems which never have arisen before. Labour will be a severe stumbling-block for many years to come, while increasing wages will serve to decrease the farmer's profits to an appreciable degree. One solution is to develop scientific and labour-saving methods upon an extensive scale. The farm labour problem is not peculiar to this country. It is more pronounced in new territories suitable to agricultural development, such as the vast plains of the United States, Canada, Argen-

tina, and the steppes of Russia. Had the pioneers in these countries been content to rely upon human labour, less than 50 per cent. of the land now under exploitation would have been reclaimed from virginity. It is the lack of labour which has been responsible for the wonderful huge power-driven machines upon the wheat-growing plains for ploughing, harrowing, seeding, reaping, and threshing. It has brought the wheatfield measuring twenty or more miles between fences within the bounds of possibility. But it is easier to introduce mechanical methods in a new than in an old country where the land is fully occupied, and where the farmers are conservative. In the United States at the present moment there is a boom in the agricultural utilisation of the electric servant, experience having proved that there are over one hundred and thirty distinct operations now performed on a farm by human and animal effort which may be more efficiently carried out, and at a lower expenditure and within shorter time, by electricity. The use of mechanical appliances upon American farms is being encouraged with unabating activity by agricultural colleges, farming experts, and the railways. In that country, as in this, people are being lured from the land by the glamour of the cities, and this migration can only be counterbalanced by the more extensive use of machinery. In America, however, the farmer receives greater assistance than his brother in these islands. He pays for his plant with his crops, and if the outlay be heavy and impossible of fulfilment within a single year, then he is assisted by extended payments. The banks advance money upon his growing crops, while directly the grain is garnered all further risk disappears. It is transferred to the elevator. In return for his delivery of grain the farmer receives a certificate which he can either realise immediately or hold against the fluctuations of the market, meantime expending low premiums for insurance against destruction by fire and other causes. British agriculture demands the infusion of some new blood by the introduction of new methods upon a sufficiently extensive scale and to a degree compatible with local requirements.

A NOVEL TIN-OPENER.

Among the many ingenious appliances which have appeared, and which make appeal to the household, is a new tin-opener. It differs completely from the usual utensil of this type, being designed upon safer principles and capable of dealing with any kind of tin. If desired, it can be employed in the orthodox manner, or it can be used to cut the top completely off the sealed metal receptacle. But possibly its most useful feature is its ability to meet the conditions arising from the new method of sealing tins. As is well known, certain commodities are so packed and sealed that the top face of the vessel

has to be completely removed. A small tongue of metal is left, which slips into a slotted key. By winding the latter the tin surface may be peeled off. Unfortunately, however, in many instances the key, which is a casting, fails to perform its allotted duty, and snaps in twain, or the sheet of tin is so sealed as to defy the peeling effort. To open such a sealed vessel in the ordinary manner with the conventional tin-opener is a difficult, if not a dangerous, task, especially if the tin be round in shape. This new opener meets such a situation. The free end is pointed, and with this the lid is punctured in the centre. Upon the arm of the opener slides a small attachment fitted with a cutting edge, while the outer end of the arm is provided with a bent projection. This last is slipped into the puncture, forming a pivot for the opener. The sliding cutter, held horizontally, is moved along the arm to the required distance from the centre, which varies with the diameter of the tin; the cutter is pressed down, cutting through the lid near the periphery; and then, by moving the opener round, describing a circle about the axis formed by the bent end of the opener, a clean circular cut is made, allowing the top of the tin to be lifted off in the form of a disc, and enabling the contents to be withdrawn in a solid mass.

AN INTERESTING TELEGRAPH FOR SHUNTING OPERATIONS.

The shunting-yard is probably one of the most dangerous corners of a railway system, more particularly in foggy weather. With a view to rendering the work safer, and to facilitate and expedite it, the Great Western Railway has installed at Southall West Junction, as an experiment, what is described as a shunting telegraph. In general appearance the apparatus resembles the telegraph which is utilised for communication between the bridge of a vessel and the engine-room. The transmitter is placed at the neck of the shunting-spur, and the indicator in the cab of the shunting-engine. The signals are transmitted electrically, the engine being fitted with shoes which establish contact with conductors set parallel to the running rails. The indicator in the cab is fitted with six different signals, each of which is illuminated electrically when brought into service. The signals which may be despatched in this manner are respectively 'Go ahead,' 'Back,' 'Stop,' 'Steady,' 'Ease up,' and 'Back smart.' Every signal transmitted remains illuminated in the cab so long as the shunter desires, so that the driver is provided with a constant visual signal of the particular task in hand. When the signal is changed a bell rings, calling the driver's attention to the fact, the bell coming into action every time the order is altered. Consequently, in this way, the visual signal is supported by an audible warning, thereby fulfilling the requirements of an efficient and reliable mechanical

signalling system between the road and the driver on the engine. The apparatus, it is stated, has proved especially useful during foggy weather, and the liability of misinterpretation is practically eliminated.

ASPARAGUS-GROWING.

It is generally thought that asparagus can only be grown in expensive, well-raised beds; but this is not so. It can be planted as seed or plants in any odd corner of a garden with excellent results, a plant being put here and there between gooseberry-bushes or between well-trained fruit-trees, or under apple-trees in orchard or garden. A dozen plants would give two bundles of good heads a week, and later on the fern-like foliage would be an ornament to the garden. Once planted, they will continue to bear for many years. Messrs W. Crisp & Sons, of Fordham Heath, Colchester, have a plant that grows by the doorway, and after cutting is finished it is tied to the lattice on the wall, and is quite pretty. As soon as the shoots appear in spring, weak liquid manure should be applied, but care should be taken not to put it on the shoots. A little salt can be given in winter. Do not cut after 20th of June.

THE CELERY CABBAGE.

The celery cabbage is a new vegetable introduced into this country from China. It supplies a long-felt want—a vegetable which can be eaten either cooked or raw, and is quite equal to boiled spinach. It is also first-rate as a salad, or for sandwiches or soup. The plant is a very rapid grower, and is fit to be cut in eight weeks from the time of sowing, and would be splendid for *cloche* work or in a cool frame. Salad could be grown all the winter. It grows to about the size of a cos lettuce, having the same upright growth; and it has a white midrib, which is excellent when boiled. Seed should be sown in early spring and autumn in rows fifteen inches apart, and should be thinned out to nine inches between each plant. In the hot season the plant is liable to run to seed. In Canada it is used for cold slaw, which is made as follows: Cut the celery cabbage in half and lay in cold water, then shave it very fine; boil from half to a pint of vinegar, stir into it the well-beaten yolk of an egg, and then pour it over the cabbage, and serve with cold meat.

SAVED FROM A BONFIRE.

In a privately printed booklet, *Some Notes by A. Donald Mackenzie*, founder of the Edinburgh firm of Mackenzie & Moncur, horticultural builders, there is an interesting reference to how the writer first became a reader of *Chambers's Journal*. Mr Mackenzie was born in the strath of Appin, Argyllshire, in 1836, and died in Edinburgh in 1915. He began life as a working joiner, turned his attention to hothouse-building, and became a heating engineer, to the business

of which he brought a scientific and practical knowledge which revolutionised the trade. The firm did work in many parts of Great Britain, including Sandringham, where the Prince of Wales, afterwards King Edward, would talk with Mr Mackenzie on the matters in hand, and show a practical interest in what was being done. In Mr Mackenzie's only too brief narrative of his early days in Argyllshire, after giving some recollections of Appin Parish School, he continues: 'What a happy life it was, roaming the woods and hills with no one to interfere, but a scolding from my mother when I stayed away too long or too late instead of attending to duties which she laid upon me in connection with our croft, or cutting peats, which, along with sticks, was our only fuel! Coals were never seen, except at the laird's house. I was for six months herding cattle at the farm of Elerig, in Glencreran, where I got my first introduction to *Chambers's Journal*. The farmer's daughters were at school in Edinburgh, and had taken home a great many copies of *Chambers's*. After the marriage of the daughters a clearance of a great many old books was made, and I had the duty of burning them laid on me. I remember what a bonfire it was. Picking up some sheets and looking them over, I got much interested, and saved as many as I could from the devouring flames. The reading of these was a great source of enjoyment to me during the summer and autumn. I have a vivid remembrance of some of the stories yet. I may say that I have continued the reading of *Chambers's Journal* ever since.' He afterwards became quite a student and reader of good books, which, along with a game of golf, were the solace of his later years.

A NEW MATERIAL FOR PAPERMAKING.

Experts in the United States Department of Agriculture have been making experiments in connection with a new material for papermaking. In Bulletin No. 309, from this department, attention is called to the possible use of zacaton grass, which, the bulletin says, grows from California and Texas southward to the Argentine Andes. It grows most profusely, however, in the mountain regions east and west of the City of Mexico, where it is harvested for the sake of its roots. These are made into brushes of various kinds, and for this reason the zacaton plant is frequently known by the common English names of broom-root grass, wire grass, and rice-root grass. At the present time the tops of the plant are allowed to go to waste; it is from these that there is reason to believe that a satisfactory papermaking material may be developed. An acre of grass should yield at least three tons of tops. The plant is a perennial one, the growth being almost entirely from self-sown seed. Unless checked by fire, cultivation, or the harvesting of the roots, the grass will soon cover

a field solidly, and it is not uncommon to find many square miles densely covered with the growth. Laboratory tests of this grass conducted by the United States Department of Agriculture show that it can be chemically reduced to paper stock by the soda process more easily and with less expense than is necessary to reduce poplar-wood. The same processes and methods which are employed for the manufacture of pulp from poplar-wood are quite suitable for the treatment of zacaton; but in place of the wood-sawing, chipping, and screening machinery, a grass duster is necessary. The paper manufactured from the stock has proved as satisfactory in physical tests as a first-grade machine-finished printing-paper. It has, moreover, a very satisfactory appearance and feel. In bleaching, however, the experiments showed that more bleaching-powder was required than with poplar stock. The percentage of air-dried fibre obtained from the zacaton grass appears to be somewhat less than that from poplar-wood, but practically equal to that of esparto.

THE SIGN AND STAR NAMES.

In *Chambers's Journal* for March 1915, in an article on 'Stars and Planets,' it is stated that the American writer Artemus Ward asked the very pointed and sensible question as to the names of the stars and signs, 'How had we discovered the names?' Perhaps some others would be interested in the best answer that can be given to this inquiry. The astronomical names on our ordinary planispheres, globes, and star maps are derived from the great official star maps, atlases, and globes in the various State Observatories. These names are the same as those found on the Anglo-Saxon planispheres, as seen in a very fine Saxon manuscript in the British Museum. The Anglo-Saxon names are the same as those found in a very valuable Roman astronomical manuscript in Latin of the second century A.D. These star names, again, are the same as those given by Hyginus and still earlier astronomers, as Ptolemy, Hipparchus, and others. This carries the star names back to the great Greek astronomers. But there is another line of evidence, quite distinct, which carries the star names backward to much remoter eras. Riccioli of Bologna, in his great work *Almagestum Novum* (1670), gives the ancient Arabic names of the stars and constellations. He speaks of them as of vast antiquity, and expresses his own opinion that the names were antediluvian. The astronomical Latin names Leo, Taurus, &c. are merely translations from the Arabic and Hebrew. Ulugh Beigh, the Tartar prince and astronomer (A.D. 1450), gives the Arabian names as they were reported to have come down from the earliest times. His *Catalogue of the Stars* was printed by Dr Hyde, with *Commentaries*, about 1660. It has been reprinted since then in England. Albumazer or

Abu Masher, who flourished A.D. 800, and was a great Arab physician and astronomer to the Caliphs of Granada (A.D. 850), hands down the same names as being antediluvian. Lyell, in his *Geology*, says 'these [Arabians] were evidently great astronomers.' He mentions Riccioli's testimony as above. The celebrated Jewish writer Aben Ezra refers to Albumazer as a great authority. These authorities carry our star names back to primeval times as being antediluvian, and even coeval with man's origin. I understand that Dr R. H. Allen, astronomer, of Chatham, New Jersey, U.S.A., has published his valuable work on *Star Names*, upon which he has been long engaged.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

RETURN.

WHAT calls thee back to mortal days,
To haunt me in these silent ways?
Whisper, beloved, what quivering pain
Unbinds thee from the grave again?
Speak to me, love, from thy dread shore;
On earth I cannot trace thee more.
Twelve moons since thou didst pass away,
And cast aside the cumbrous clay;
And I, deep bowed beside thy bier,
Mourned thee for lost with futile tear.
That love which moves the sun and stars
Was thrust without its broken bars;
Yet, still, like one of alien birth
From unseen realms who walks the earth,
Thou com'st from out the astral gloom
To steal about my silent room,
And stab the web of memory spun
Gray o'er my peace from sun to sun.
Ofttimes I hear, not as in dreams,
Thy swift, elusive, lightning gleams
Pierce through my darkly veiled brain
Sweet words of old that ring again
Out through the silent, listening air,
As, floating forth in ambient prayer,
Thy subtle presence shimmers by,
Translucent to my straining eye.
When death unloosed thy lovely star,
And set thy gate of life ajar;
When God broke short life's golden strand,
And laid on thee His silent hand,
Surely of thee I was a part
Deep set within thy glowing heart,
Strong as in bond divine which knew
That I from thee my heaven-world drew.
Was I not thine, and not mine own,
Thine eyes my light, thy breast my home?
Break through the wall of starry light
That hides thee from my mortal sight;
Come forth from out thy shadowy shroud,
That veils thee as a silver cloud
Dims the pure light of heaven's high shore,
And bid me call thee mine once more.

VIOLET TWEEDALE.

Chambers's Journal

SEVENTH SERIES

THE BOAR'S FOOT.

By Mrs BRIAN LUCK.

CHAPTER I.

EVERY Frenchman is at heart a detective. M. Achille Beaulande, being a Frenchman, was no exception to the rule; and, further, as every detective, professional or amateur, has to be a good actor as well, Achille did not neglect that point either, and was, so to speak, a Vidocq, an Arsène Lupin, and a Coquelin rolled into one. He was other things as well: an epicure, a linguist, a connoisseur in clothes, and a casual amorist. Incidentally he was a large and prosperous apple-grower from Picardy, and a very good friend. You will see, in this little episode of his career, which of these rôles he played the best.

He stood on the wide steps of his hotel at Monte Carlo; and, though it was only half-past eleven, and in March, the sun was very hot. Two little tables were just outside on the wide top step, and at one of them sat a fair American, well dressed, friendly. She had played a rubber of bridge with him the week before.

'Good-morning, monsieur,' cried the lady. 'You are waiting to go out with your Englishman, I suppose?'

Achille bowed, and when he bowed it was something very beautiful and moving. It invited, it suggested, it conquered, like the abbé's voice when he only said, 'Madame.'

'I do wish you would introduce him to me,' she said. 'He is so good-looking, so distinguished, so smart, even if he is sixty. And you know him well, too, don't you?'

'Madame, I could not possibly say I know him well. I say zat of no one, least of all of an Englishman. Every March he comes here for a month. The last three Marches I also have come here for a month, zat is all.'

'Well, you go about together a lot, and I'd got the notion you knew him pretty well. He's a widower, isn't he?'

'So I believe, madame.'

'A son, isn't there? Do you know?'

'I regret, madame, I do *not* know,' replied Achille, seeking for escape.

'Sir Donald Carnegie,' she pursued reflectively. 'He's a coin-collector, isn't he?'

'I believe so. What zey call "an English country gentleman;" yet I never hear people say "an English town gentleman." Zat is vairy

curious. I must find out. *Tiens!* I go, I fly, I tear myself away, madame; but I see him impatient for me at the bottom of the steps.'

Another beautiful bow, and Achille was gone.

The man whom he joined was certainly smart and distinguished, as the lady had said. He was tall and upright, with fine features and a gray moustache. He walked well, and wore well-made clothes, and women looked at him. The clothes were always gray for the daytime, and the gray hair and the gray moustache, and his very blue eyes, made him noticeable.

Achille lit a cigarette and walked along with his friend.

'The lady on the steps, zat American who plays bridge, would like to meet you,' he began.

'Very kind of her. Tell her I've got measles, or glanders, or a most infernal temper—which is true. I don't want to meet any woman.'

'All right,' returned Achille placidly. 'I'll tell her you are an Englishman. Zat will explain all. She is not stupid.'

'English? Who said I was English?' demanded Sir Donald. 'I'm not English; I'm Scotch. And I thank God for it,' he added.

'Ten thousand pardons. I regret infinitely;' and M. Beaulande's hat and hand described an interesting parabola in the air.

'Not at all, not at all,' replied the old gentleman. 'Well, where shall we sit? The usual place?'

It was just three years ago, reflected Achille, that he first met the Carnegies. The wife had been alive then, a nice woman, and had been very good-looking—yes, was good-looking even then. The fact had not escaped him. He, not knowing them, had rendered her a small service, an ordinary courtesy, the night before they left; 'a nothing, a real nothing,' Achille would say; 'but then it is "nothing" that endears you to a woman.'

They had left the next day, and he did not see them again. The following March Sir Donald, true to his custom, had returned, but alone. Achille was at the hotel for his month's holiday; and, recognising the baronet in the hall, he raised his hat. Sir Donald had not forgotten him either, and they spoke for a few

minutes. Presently Achille asked after Lady Carnegie. Was she there? Was she coming?

'She is dead,' said Sir Donald gravely.

Achille said nothing. First he stared, and then he had the good thought to raise his hat again, which he did, and stood uncovered a moment.

And that made their friendship. Sir Donald was touched by the silence, by what he interpreted as the deep and unexpressed sympathy of the Frenchman. The respect conveyed in that simple action of raising his hat was what reached the widower's heart.

But I am sorry to say that the real reason of M. Beaulande's silence was that he was bereft of speech. 'What!' he said to himself; 'this Englishman passes the month of March, year after year, in this delightful spot, in company with the wife of his bosom, at least of his shirt-front, stiff and starched. Here they spend the most delicious of hours in a land of orange-blossom and sunshine. And yet! *poudre de Perlimpimpin!*' (which was his favourite expletive), 'here he comes again after his wife's death, unchanged, unmoved!'

'I will certainly say you have the glanders,' murmured Achille; 'but, if it is difficult now to parry that lady's questions, it will become infinitely more difficult later on to answer them, when she hears zat you are infectious. And of such a disease, too! So dangerous, so unsuitable for a hotel!'

The blue eyes opposite gleamed for a moment with amusement.

'What questions does she ask of me?'

'*Mon Dieu!* she'll ask anything, zat lady. She wished to know, this morning, if you had not a son.'

And then Achille got a surprise. He was looking vaguely across at his friend in pure amusement, without a tinge of curiosity, and then he saw a transformation. He saw his friend's face grow hard, his mouth set in a tight line; and he saw the eyes that he liked so much flash dangerously. Bright, angry light they shot out; wild, terrible anger; then, in a moment, it was all over.

'I have no son,' said Sir Donald harshly.

But Achille had seen.

'Shall we go for a turn?' asked his companion. 'It's only twelve o'clock. Come and get an English paper.'

As they walked along Achille opened his eyes and stared with all his might. For coming toward them was the very replica of Donald Carnegie, but that he was thirty years younger. The same figure, the same walk, the same face. Fine features somewhat tanned, a small moustache that was brown, not gray, but precisely the same clear-cut chin, and precisely the same bright blue eyes. Even the suit was gray, a flannel thing for yachting, and he wore white deck-shoes.

And he was coming nearer. Achille still stared with all his eyes. He could have sworn that they were father and son; moreover, that they both went to the same tailor.

Perhaps it was Achille's steady, unwinking gaze that caused the young man to look at him. His eyes then fell on the tall, well-preserved figure in the gray suit. The stranger half stopped. Then he came on. He was quite close now. A wave of colour came slowly into his face. It came to his cheeks and mounted to his forehead. He raised his hat and looked at Sir Donald.

Sir Donald walked on.

'Ah,' said Achille to himself as he also walked on beside his friend, 'then the Scotch *are* English after all, only more so.'

The young man had been cut—cut dead, as they say, and presumably—well, presumably by his own father. He was well dressed and debonair. Therefore it was to be inferred that he, not being of a Latin race, was not penniless. He had means, good looks, *chic*. Ah, what an entrancing mystery!

Achille, wise in his generation, pretended that he had seen nothing, and presently they went back to the hotel.

When Sir Donald was tired of sunning himself and watching the people, he always wandered off to the jewellers' and curiosity shops to look at their coins. Far away, up in the chilly North, he had a collection of Provençal coins that was famous in both Europe and America. There were Roman coins from Orange and Valence, there were those of the date of King René, and there was, greatest gem of all, a very well-preserved specimen of 'The Boar's Foot.'

If you go to Nîmes you will see the beautiful Roman house there, and its collection of Roman objects and implements. You will see specimens of a coin struck by the Romans at Nîmes, bearing on one side the figure of a crocodile. And there is a peculiarity of these coins that renders them unique in the world. The smooth circumference is broken at one point by a small projection of the metal. It sticks out, a tiny three-cornered thing shaped like a boar's foot. Hence the name. Only a few specimens are known in Europe; some are at Nîmes, one in London, and two at Petrograd. Sir Donald Carnegie was the envied owner of one of these coins, and it was his most valued possession.

This treasure was generally kept locked away in a velvet-lined box, but on this particular visit to Monaco it accompanied its owner. Sometimes he looked at the little crocodile lying placidly in its velvet bed; and sometimes he would lift it gently, holding it by the edges between finger and thumb. Yes, it was a great treasure, well preserved, and, thank Heaven! genuine.

To-day he called upon Gobert, a well-known jeweller and numismatist.

'Anything to tempt me to-day?' he asked at the doorway.

'Ah, Sir Carnegie, what a pleasure to see you here once more! Since last week I have these two coins. See, how admirable, how perfect! And this very year they are four hundred years old. Think there.'

'I am afraid I have these,' said Sir Donald.

'These here, then? They are beautiful. Rare also.'

'These too. I have them all.'

'Alas! it is impossible to show you what you have not got; you have all. But stay; I have here a forging that will interest you. But something ravishing, something perfect. It is a reproduction of "The Foot of the Boar."'

The jeweller opened a little box and took out of it a small coin, and gazed with professional pride at it.

'*Ecoutez!* I do not say it is a good thing to do to make false coins; it is a business that hurts my own. Still, when a *canbrioleur* has the talent—nay, the genius—to produce a thing as ravishing, as wonderful, as that, *mon Dieu!* then I admire him and the coin too.'

Sir Donald lifted the spurious coin.

'I ought to know about these things,' he said slowly; 'but unless you had assured me that this was a counterfeit I really should not have known. Who made it?'

'The man who made it is dead, monsieur. Look, I will show you how to tell the difference; it is very slight. See, in this coin the tail of the crocodile twists a little bit up; in a genuine coin the tail twists a little down. You see?'

'I see; so it does. Mine does, I know. I mean the tail of my crocodile. Is that all?'

'That is all, except, of course, that they are hundreds of years apart in age. But the thing is marvellous—marvellous.'

'It is marvellous,' agreed Sir Donald. 'I happen to have mine with me this time, and I'll bring it along to-morrow to compare it with yours.'

'Then you will not have this one, monsieur?'

'No, no, I won't buy it, thank you. Put it in your window. It will attract any one who knows.'

He had hardly gone half-an-hour when a couple of young foreigners, by the cut of them English, came into the shop. One was a clean-shaven youth with longish hair under a peaked sailing-cap, and the other was a tall, bronzed man, with bright blue eyes and features uncommonly like those of the old client, Sir Carnegie.

Now there was no coincidence in the young man coming into the shop. His eye had been attracted by the odd coin in the window, and as he knew about such things, and was interested in them, in he came. Precisely as Sir Donald had said.

'That coin in the window? Ah! certainly.

A spurious one; but, as you see, very perfect. There is not another known in the world.'

'There are not many originals in the world, are there?' said he with the blue eyes.

'There are only six or seven. Monsieur is interested in coins? He collects, perhaps?'

'No. But what is the price of that?'

The Frenchman named his figure.

'I say, Donald,' drawled the long-haired youth, 'you're not going to buy that rotten little thing, are you?'

His friend did not answer him.

'That seems a good deal,' he said in reply to the jeweller. 'And you say it is an imitation.'

'*Parfaitement.* It is an imitation. Also, as I know it to be a modern coin, and sell it as such, I would do so on the understanding that you accept it equally, and would not expose, describe, or sell it as genuine.'

'All right. I will buy it. As an imitation, of course, and I shall not try to pass it off as the real thing.'

'It is to protect myself,' said Gobert. 'I should not like people to suppose I had sold you a false for a real coin. Though it is easy to see the difference if you take it to Nîmes. The real ones have the crocodile's tail going downward a little; this one has the tail going up.'

'I see—I see,' said the young man, for all the world exactly like Sir Donald Carnegie. And he paid for the coin and went out.

'What in thunder do you want a dirty little thing like that for?' asked his friend, in mild surprise. 'Not as if it were a real one, you know.' And they went to Ciro's for some beer.

Beer is good at many times; but it is surprisingly and insidiously good at four-thirty in the afternoon. A golden joy capped with a snowy cloud of froth, what more alluring to the eye? And it is so good, too, just the moment before and the moment after it is drunk.

Now, Achille, when he was in the mood, oftentimes had a coffee or an *eau sucrée* at Ciro's. And this afternoon, coming across the square, he felt very much in the mood for it. For his sharp black eyes fell upon the figures of the two Britons, and the detective in him awoke again. He took a seat at a table, and saw the upright figure of his friend pass, stop, and his clear eyes scan the place for some sight of Achille.

Achille lost no time. He waved a hand and a hat, while his expressive face implored, entreated his friend to come.

And all because the wicked Achille knew that to reach him the old gentleman would have to pass the table where the two young men were sitting, and he wished to see what would happen. When he actually saw what did happen he was sorry that he brought it about.

Sir Donald came slowly through the crowd. Now, whether he with the blue eyes thought that the non-recognition of the morning was intentional or not, that I do not know; but he

acted as though he thought it had been a mistake. When the old man came close to them, as he was obliged to do very slowly because of the crowd, the young man rose to his feet and lifted his hat. Then he stood for a moment, uncovered, and quite still.

Sir Donald passed on tranquilly, and seated himself beside Achille. He called a waiter and ordered a coffee and cognac.

'*Poudre de*'— began Achille to himself. 'What a nerve! But, alas! what a heart! It is not a heart at all; it must be a parallelogram of phosphor-bronze.'

The young Englishman went away.

Monsieur Beaulande took out a cigarette—the fifteenth that day. He was quite delighted to observe that his friend's hand was shaking as he put down the coffee-cup.

'And what have you been doing with yourself, *cher ami*?' he began pleasantly. And he was told of the visit to the jeweller's, and the strain was relaxed. Achille, who hated coins, had to hear the history of the Boar's Foot (of which he had never heard), and of the false specimen at Gobert's shop.

'I'll show you mine one day. I have it here with me, locked up.'

'I should like to see it,' murmured the polite Frenchman; 'it must be a great treasure.'

'Yes; and if there was another to be had for love or money I'd have it. But there isn't. There are only seven in Europe, and they are all known.'

Achille nodded and smiled, but his thoughts were far away.

GRETN A GREEN.

By Sir ANDREW AGNEW.

Delicious is the lay that sings
The haunt of happy lovers.

AND what haunt more sacred to happy lovers than the hamlet of Gretna Green? Here is the land of promise to which so many eager hearts have turned. Here is the blacksmith's anvil at which have been forged so many links which only death could unloose. For a hundred years Gretna Green was better known than any other place of its size in the United Kingdom; and to this day we cannot read the name, even on the prosaic name-board of its railway station, without its calling up a whole host of romantic memories.

These memories, however, are about to be rudely disturbed. Gretna Green is to spring into public notice once again, but associated this time not with love, but with war. The Government have taken the village, with a tract of surrounding land, for the purpose of setting up extensive works for the production of war material. The blacksmith's shop will be overshadowed by huge factories, and the historic village will become the adjunct of a mushroom city which is to house thirty thousand workmen with their families. Before the change has actually taken place it may be worth while for a few moments to recall some of the circumstances which have given Gretna Green its singular reputation.

Down to the middle of the eighteenth century Gretna Green was an obscure hamlet of thatched cabins, like scores of others in the south of Scotland, and quite unaware of the distinction in store for it. But an Act of Parliament passed in 1754 gave it an opening of which it was quick to take advantage. Before that date clandestine marriages in England were common enough, and were performed in various ways. Sir Walter

Besant has made us familiar with one class of such marriages in his well-known novel, *The Chaplain of the Fleet*. But in the year above mentioned a law was passed imposing very heavy penalties on all persons celebrating marriages anywhere in England except in buildings licensed for the purpose, and after the proper formalities had been complied with. Since few clergymen cared to run the risk of fourteen years' transportation, irregular marriages south of the Border came to a sudden end, and impatient lovers had to look elsewhere for a means of getting the knot speedily, and at the same time securely, tied. This was the origin of the Gretna marriages.

The marriage law of Scotland has always been of a peculiarly simple character. A man and a woman have only to declare themselves man and wife in the presence of witnesses, and the thing is done. A legal marriage is instantaneously effected. This is still the law for persons domiciled in Scotland; it formerly applied to every one, whether domiciled in Scotland or not. Consequently, after 1754, a stream of post-chaises began to set toward the Scottish Border; and Gretna Green, being only a few miles from Carlisle, where many roads converged, and the easiest hamlet to reach on Scottish soil, woke up to a sudden activity.

The first of the self-constituted 'priests of Gretna,' as they came to be called, was one Joseph Paisley, who kept a small grocery store in a thatched cottage near the church. He is described as a man of enormous size, weighing at least twenty-five stone; and perhaps his powerful build did something to inspire confidence in the weaker clients who sought his aid. At any rate, he was the first to make the marrying of runaway couples a regular trade, and for

some time he had a practical monopoly of the business. But his house lay a little off the main road, whilst exactly opposite the turn which led to it stood, and still stands, a blacksmith's forge. The old road from Carlisle crossed the Sark, the boundary stream, at the foot of the present village of Springfield. But Springfield did not come into existence till long after 1754, so that the first Scottish dwelling reached was that of the blacksmith. Here anxious couples often stopped to inquire the way to Paisley's house, till the blacksmith, tired of answering such questions, and of directing easily earned fees into another man's pocket, determined to set up business on his own account. From that time Gretna marriages became associated in the public mind with the old smithy of Headless Cross; and the only 'priest' whose memory survives is the village blacksmith.

Later, in the early part of last century, another formidable rival appeared on the scene. This was the tenant of Gretna Hall, the picturesque old mansion which still stands among venerable trees a little way back from the village street. The owner of the property had got into financial difficulties, and was glad to let his house to John Linton, who turned it into an inn and posting-house. As Linton had been a valet in the service of Sir James Graham of Netherby, he understood the needs and tastes of the wealthier classes, and his comfortable hotel became well patronised. From 1825 onwards all the principal marriages took place at the Hall, Linton himself conducting the ceremony.

The little village in the heyday of its popularity must have enjoyed a lively time. Scarcely a day went by without its excitement: first the clatter of post-chaises bringing lovers impatient to be united, and a little later the clatter of tongues as furious guardians arrived to find themselves too late. The number of marriages contracted at Gretna Green was very large. For a considerable period they averaged fully three hundred in the year; and one man alone, during a career of thirty years as 'priest,' confessed to having united no fewer than three thousand eight hundred and seventy-two couples. One hopes that few of them found cause to repent at leisure the vows made in so much haste.

The most celebrated of the Gretna marriages was that of the Earl of Westmorland to Miss Sarah Child, which took place in 1782. She was the only daughter of the wealthy banker Robert Child, founder of Child's Bank, by Temple Bar. For some reason Mr Child objected to Lord Westmorland as a son-in-law. What the reason was history does not state; but, as he proved obdurate, the young couple agreed that there was nothing for it but to elope, and they set off secretly for Gretna Green. Mr Child was soon on their track, and by dint of lavish expenditure he was able to make a record journey,

and to sight the fugitives before they reached the Border. Thereupon ensued a mad race. Both parties urged their postillions; the postillions urged their horses; the wheels flew round, and the coaches thundered along at breakneck speed. Mr Child, with the fresher team, continued to gain ground; and as his straining horses came level with the window of the foremost chaise, Lord Westmorland drew out a pistol and shot one of the leaders in the head, bringing down the whole team, and leaving the pursuers at a complete standstill. Having made sure that her father was uninjured, Miss Child agreed to continue her flight, and the pair reached their destination without further mishap, and were safely united before Mr Child could come up with them a second time. He vowed in his anger that neither they nor their children should touch a single penny of his money, but of course he relented in due time; and, as his daughter predeceased him, he left almost the whole of his enormous fortune, including Osterley Park, with its stately mansion, to his granddaughter, another Sarah, who was married to the fifth Earl of Jersey. Her love affairs do not seem to have run any more smoothly than those of her mother; but she got over the difficulties in the same way, being married to Lord Jersey at Gretna Green in 1804. Some thirty years later her own daughter, Lady Adela Villiers, made a similar runaway match with Captain Charles Ibbetson. It is curious that history should thus have repeated itself in three successive generations!

There were other Gretna marriages which made some little stir in their day. Prominent among them was that of Lord Cochrane, afterwards tenth Earl of Dundonald, a brilliant seaman and a man of many adventures. He was the chosen heir of an uncle, an East India merchant of great wealth. This uncle considered that, since he was going to leave him his fortune, he had a right to select the wife who was to share it with him. On this point uncle and nephew disagreed. Lord Cochrane settled the question by a journey to Gretna Green, accompanied by Miss Katherine Barnes, which resulted in his being promptly cut out of the will. He gallantly declared, however, to the end of his life that he considered his wife a rich equivalent for his uncle's fortune.

Then there was the Lord Chancellor Erskine, famous as a lawyer and as the chivalrous defender of Queen Caroline. In his old age he felt persuaded that no one was so fitted to make him happy and comfortable as his housekeeper, Miss Mary Buck. His family disapproved of the match, and would have thwarted his plans. So he gave them the slip, and sped secretly to Gretna Green with Miss Buck, disguising himself in woman's clothes so as to throw them off the scent.

And, to give one more example, there was

Prince Charles Ferdinand of Bourbon, brother of the King of Naples, who fell in love with the beautiful Miss Penelope Smith, and resolved to marry her. But one attempt after another to get the marriage performed on the Continent was frustrated by his influential relatives. So at length the pair bethought them of Gretna Green, and hither they came and were wedded in 1836, rejoiced to find some haven where neither royal decrees nor papal marriage laws could prevent two persons obviously intended for each other from being lawfully joined together in holy matrimony.

It was the railway, the destroyer of so much that is picturesque, that gave the death-blow to Gretna Green and its marriages. The advent of the railway made the journey to the Border so cheap and expeditious that hasty marriages increased to an alarming extent; and the scene on the station platform, where degenerate 'priests' lay in wait to compete for the patronage and the fees of hapless young lovers, grew into a serious scandal. Every one began to feel that a check was needed, and the Marriage Act of 1856 was passed with general approval. The measure was not a drastic one, like the old Act of 1754; it merely enacted that to make a marriage legal one of the parties must have resided in Scotland

for three preceding weeks. But these three weeks were sufficient to do the business. Gretna marriages rapidly dwindled away, and after a crowded century of glorious life the little Border village sank once more into repose, and was left to support itself on past memories and summer visitors.

Yet not altogether on past memories. Old customs die hard. Though no reason now exists for a Gretna marriage, there are romantic souls who do not ask for reason, and who find a thrill in a rude ceremony performed by the side of a forge which is wanting in the decorous ritual carried out before the altar. For such the matrimonial office at Headless Cross has been kept open until now, and the blacksmith has never been long without a client. But he may close his register now. A new spirit is abroad. Gretna Green is preparing to start a fresh page in its history, in which stern reality will take the place of tender sentiment. Banks are already jostling each other in the village street in anticipation of the stream of wealth which is expected to pour into the district. And with the inrush of Government workmen, and the industrial activity which they come to create, the last glimmer of romance which attaches to Gretna Green will inevitably disappear.

THE DAY OF WRATH.

A STORY OF 1914.

By LOUIS TRACY, Author of *The Final War*, *Rainbow Island*, *The Terms of Surrender*, &c.

CHAPTER VIII.—A RESPITE.

NEVER before in the course of a somewhat varied life had Dalroy felt so irresolute, so helplessly the victim of circumstances. Bereft as he was of the local knowledge possessed by Joos and the other Belgians, any scheme he adopted must depend wholly on blind chance. The miller had described the wood as occupying a promontory in a bend of the Meuse, with steep cliffs forming the southern bank of the river. There was a tow-path; possibly a series of narrow ravines or clefts gave precarious access from the plateau to this lower level. Probably, too, in the first shock of fright, the people in the hut had made for one of these cuttings, taking Irene with them. They believed, no doubt, that the Englishman had been shot or captured, and after that spurt of musketry so alarmingly near at hand, the lower part of the wood would seem alive with enemies.

Dalroy blamed himself, not the others, for this fatal bungling. Before snatching a much-needed rest he ought to have arranged with Joos a practicable line of retreat in the event of a night alarm. Of course he had imposed silence on all as a sort of compulsory relief from the tension of the earlier hours, but he

saw now that he was only too ready to share the miller's confidence. Not without reason had poor Dr Lafarge warned his fellow-countrymen that 'there were far too many Germans in Belgium.' Schwartz and his like were to be found in every walk of life, from the merchant princes who controlled the trade of Antwerp to the youngest brush-haired waiter in the Café de la Régence at Brussels.

Dalroy was aware of a grim appropriateness in the fate of Schwartz. The German automatic pistols carried soft-nosed bullets, so the arch-traitor who murdered the Visé doctor had himself suffered from one of the many infernal devices brought by *Kultur* to the battlefields of Flanders. But the punishment of Schwartz could not undo the mischief the wretch had caused. The men he led knew the nature and purpose of their errand. They would report to the first officer met on the main road, who might be expected to detail instantly a sufficient force for the task of clearing the wood. In fact, the operation had become a military necessity. There was no telling to what extent the locality was held by Belgian troops, as, of course, the runaway warriors would magnify

the firing a hundredfold, and no soldier worth his salt would permit the uninterrupted march of an army corps along a road flanked by such a danger-point. In effect, Dalroy conceived a hundred reasons why he might anticipate a sudden and violent end, but not one plan offering a fair prospect of escape. At any rate, he refused to be guilty of the folly of plunging into an unknown jungle of brambles, rocks, and trees, and elected to go back by the path to the foot of the quarry, whence he might, with plenty of luck, break through on a flank before the Germans spread their net too wide.

He had actually crossed some part of the clearing in front of the hut when his gorge rose at the thought that, win or lose in this game of life and death, he might never again see Irene Beresford. The notion was intolerable. He halted, and turned toward the black wall of the wood. Mad though it was to risk revealing his whereabouts, since he had no means of knowing how close the nearest pursuers might be, he shouted loudly, 'Miss Beresford!'

And a sweet voice replied, 'Oh Mr Dalroy, they told me you were dead, but I refused to believe them!'

Dalroy had staked everything on that last despairing call, little dreaming that it would be answered. It was as though an angel had spoken from out of the black portals of death. He was so taken aback, his spirit was so shaken, that for a few seconds he was tongue-tied, and Irene appeared in the moonlit space before he stirred an inch. She came from an unexpected quarter, from the west, or Argenteau, side.

'The others said I was a lunatic to return,' she explained simply; 'but when I came to my full senses after being aroused from a sound sleep, and told to fly at once because the Germans were on us, I realised that you might have outwitted them again, and would be looking for us in vain. So here I am!'

He ran to her. Now that they were together again he was swift in decision and resolute as ever. 'Irene,' he said, 'you're a dear. Where are our friends? Is there a path? Can you guide me?'

'Take my hand,' she replied. 'We turn by a big tree in the corner. I think Jan Maertz followed me a little way when he saw I was determined to go back.'

'I suppose I had unconscious faith in you, Irene,' he whispered, 'and that is why I cried your name. But no more talking now. Rapid, silent movement alone can save us.'

They had not gone twenty yards beneath the trees when some one hissed, 'Visé!'

'Liège, you lump!' retorted Dalroy.

'Monsieur, I'—

'Shut up! Hold mademoiselle's hand, and lead on.'

He did not ask whither they were going. The path led diagonally to the left, and that was what he wanted—a way to a flank.

Maertz, however, soon faltered and stopped in his tracks.

'The devil take all woods at night-time!' he growled. 'Give me the highroad and a wagon-team, and I'll face anything.'

'Are you lost?' asked Dalroy.

'I suppose so, monsieur. But they can't be far. I told Joos'—

'Jan, is that you?' cried Léontine's voice.

'Ah, Dieu merci! These infernal trees'—

'Silence now!' growled Dalroy imperatively. 'Go ahead as quickly as possible.'

The semblance of a path existed; even so, they stumbled over gnarled roots, collided with tree-trunks which stood directly in the way, and had to fend many a low branch off their faces. They created an appalling noise, but were favoured by the fact that the footpath led to the west, whereas the pursuers must climb the cliff on the east.

Léontine, however, led them with the quiet certainty of a country-born girl moving in a familiar environment. She could guess to a yard just where the track was diverted by some huge-limbed elm or far-spreading chestnut, and invariably picked up the right line again, for the excellent reason, no doubt, that the dense undergrowth stood breast-high elsewhere at that season of the year.

After a walk that seemed much longer than it really was—the radius of the wood from the hut being never more than two hundred yards in any direction—the others heard her say anxiously, 'Are you there, father?'

'Where the deuce do you think I'd be?' came the irritated demand. 'Do you imagine that your mother and I are skipping down these rocks like a couple of weasels?'

'It is quite safe,' said the girl. 'I and Marie Lafarge went down only last Thursday. Jules always goes that way to Argenteau. He has cut steps in the bad places. Jan and I will lead. We can help mother and you.'

Dalroy, still holding Irene's arm, pressed forward.

'Are we near the tow-path?' he asked.

'Oh, is that you, Monsieur l'Anglais?' chuckled the miller. 'Name of a pipe! I was positive those *sales Alboches* had got you twenty minutes since. Yes, if you trip in the next few yards you'll find yourself on the tow-path after falling sixty feet.'

'Go on, Léontine!' commanded Dalroy. 'What you and your friend did for amusement we can surely do to save our lives. But there should be moonlight on this side. Have any clouds come up?'

'These are firs in front, monsieur. Once clear of them, we can see.'

'Very well. Don't lose another second. Only,

before beginning the descent, make certain that the river-bank holds no Germans.'

Joos grumbled, but his wife silenced him. That good lady, it appeared, had given up hope when the struggle broke out in the kitchen. She had been snatched from the jaws of death by a seeming miracle, and regarded Dalroy as a very Paladin. She attributed her rescue entirely to him, and was almost inclined to be sceptical of Joos's sensational story about the killing of Busch. 'There never was such a man for arguing,' she said sharply. 'I do believe you'd contradict an archbishop. Do as the gentleman bids you. He knows best.'

Now, seeing that madame herself, after one look, had refused point-blank to tackle the supposed path, and had even insisted on retreating to the cover of the wood, Joos was entitled to protest. Being a choleric little man, he would assuredly have done so fully and freely had not a red light illumined the tree-tops, while the crackle of a fire was distinctly audible. The Germans had reached the top of the quarry, and, in order to dissipate the impenetrable gloom, had converted the hut into a beacon.

'*Miséricorde!*' he muttered. 'They are burning our provisions, and may set the forest ablaze!'

And that is what actually happened. The vegetation was dry, as no rain had fallen for many a day. The shavings and store of logs in the hut burned like tinder, promptly creating a raging furnace wholly beyond the control of the unthinking dolts who started it. The breeze which had sprung up earlier became a roaring tornado among the trees, and some acres of woodland were soon in flames. The light of that fire was seen over an area of hundreds of miles. Spectators in Holland wrongly attributed it to the burning of Visé—which was, however, only an intelligent anticipation of events, because the delightful old town was completely destroyed a week later in revenge for the defeats inflicted on the invaders at Tirlemont and St Trond during the first advance on Antwerp.

Once embarked on a somewhat perilous descent, the fugitives gave eyes or thought to naught else. Jules, the pioneer quoted by Léontine, who was the owner of the hut and maker of sabots, had rough-hewed a sort of stairway out of a narrow cleft in the rock-face. To young people, steady in nerve and sure of foot, the passage was dangerous enough, but to Joos and his wife it offered real hazard. However, they were allowed no time for hesitancy. With Léontine in front, guiding her father, and Maertz next, telling Madame Joos where to put her feet, while Dalroy grasped her broad shoulders and gave an occasional eye to Irene, they all reached the level tow-path without the least accident. Irene, by the way, carried the rifle, so that Dalroy should have both hands at liberty.

Without a moment's delay he took the weapon

and readjusted the magazine, which he had removed for the climb. Bidding the others follow at such a distance that they would not lose sight of him, yet be able to retire if he found the way disputed by soldiers, he set off in the direction of Argenteau.

In his opinion the next ten minutes would decide whether or not they had even a remote chance of winning through to a place of comparative safety. He had made up his own mind what to do if he met any Germans. He would advise the Joos family and Maertz to hide in the cleft they had just descended, while he would take to the Meuse with Irene—provided, that is, she agreed to dare the long swim by night. Happily there was no need to adopt this counsel of despair. The fire, instead of assisting the flanking party on the western side, only delayed them. Sheer curiosity as to what was happening in the wood drew all eyes there rather than to the river-bank, so the three men and three women passed along the tow-path unseen and unchallenged.

After a half-mile of rapid progress Dalroy judged that they were safe for the time, and allowed Madame Joos to take a much-needed rest. Though breathless and nearly spent, she, like the others, found an irresistible fascination in the scene lighted by the burning trees. The whole country-side was resplendent in crimson and silver, because the landscape was now steeped in moonshine, and the deep glow of the fire was most perceptible in the patches where ordinarily there would be black shadows. The Meuse resembled a river of blood, the movement of its sluggish current suggesting the onward roll of some fluid denser than water. Old Joos, whose tongue was seldom at rest, used that very simile.

'Those cursed Prussians have made Belgium a shambles,' he added bitterly. 'Look at our river. It isn't our dear, muddy Meuse. It's a stream in the infernal regions.'

'Yes,' gasped his wife. 'And listen to those guns, Henri! They beat a sort of *roulade*, like drums in hell!'

This stout Walloon matron had never heard of Milton. Her ears were not tuned to the music of Parnassus. She would have gazed in mild wonder at one who told of 'noises loud and ruinous.'

When Bellona storms

With all her battering engines, bent to raze
Some capital city.

But in her distress of body and soul she had coined a phrase which two, at least, of her hearers would never forget. The siege of Liège did, indeed, roar and rumble with the din of a demoniac orchestra. Its clamour mounted to the firmament. It was as though the nether fiends, following Moloch's advice, were striving, Arm'd with Hell-flames and fury, all at once, O'er Heaven's high towers to force resistless way.

Dalroy himself yielded to the spell of the

moment. Here was red war such as the soldier dreams of. His warrior spirit did not quail. He longed only for the hour, if ever the privilege was vouchsafed, when he would stand shoulder to shoulder with the men of his own race, and watch with unflinching eye those same dread tokens of a far-flung battle line.

Irene Beresford seemed to read his passing mood. 'War has some elements of greatness,' she said quietly. 'The pity is that, while it ennobles a few, it degrades the multitude.'

With a woman's intuition, she had gone straight to the heart of the problem propounded by Teutonism to an amazed world. The 'degradation' of a whole people was already Germany's greatest and unforgivable offence. Few, even the most cynical, among the students of European politics could have believed that the Kaiser's troops would sully their country's repute by the inhuman excesses committed during those first days in Belgium. At the best, 'war is hell;' but the great American leader who summed up its attributes in that pithy phrase thought only of the mangled men, the ruined homesteads, the bereaved families which mark its devastating trail. He had seen nothing of German 'frightfulness.' The men he led would have scorned to ravage peaceful villages, impale babies on bayonets and lances, set fire to houses containing old and bedridden people, murder hostages, rape every woman in a community, torture wounded enemies, and shoot harmless citizens in drunken sport. Yet the German armies did all these things before they were a fortnight in the field. They are not impeached on isolated counts, attributable, perhaps, to the criminal instincts of a small minority. They carried out bestial orgies in battalions and brigades acting under word of command. The jolly, good-humoured fellows who used to tramp in droves through the Swiss passes every summer, each man with a rucksack on his back, beguiling the road in lusty song, seemed to cast aside all their cheerful camaraderie, all their exuberant kindliness of nature, when garbed in the 'field gray' livery of the State, and let loose among the pleasant vales and well-tilled fields of Flanders. That will ever remain Germany's gravest sin. When 'the thunder of the captains and the shouting' is stilled, when time has healed the wounds of victor and vanquished, the memories of Visé, of Louvain, of Aerschot, of nearly every town and hamlet in Belgium and northern France once occupied by the savages from beyond the Rhine, will remain imperishable in their horror. German *Kultur* was a highly polished veneer. Exposed to the hot blast of war, it peeled and shrivelled, leaving bare a diseased, worm-eaten structure, in which the honest fibre of humanity had been rotted by vile influences, both social and political.

Women seldom err when they sum up the characteristics of the men of a race, and the women of every other civilised nation were united

in their dislike of German men long before the first week in August 1914. Irene Beresford had yet to peer into the foulest depths of Teutonic 'degradation;' but she had sensed it as a latent menace, and found in its stark records only the fulfilment of her vague fears.

Dalroy read into her words much that she had left unsaid. 'At best it's a terrible necessity,' he replied; 'at worst it's what we have seen and heard of during the past twenty-four hours. I shall never understand why a people which prided itself on being above all else intellectual should imagine that atrocity is a means toward conquest. Such a theory is so untrue historically that Germany might have learnt its folly.'

Joos grew uneasy when his English friends spoke in their own language. The suspicious temperament of the peasant is always doubtful of things outside its comprehension. He would have been astounded if told they were discussing the ethics of warfare.

'Well, have you two settled where we're to go?' he demanded gruffly. 'In my opinion, the Meuse is the best place for the lot of us.'

'In with you, then,' agreed Dalroy; 'but hand over your money to madame before you take the dip. Léontine and Jan may need it later to start the mill running.'

Maertz laughed. The joke appealed strongly.

Madame Joos turned on her husband. 'How you do chatter, Henri!' she said. 'We all owe our lives to this gentleman, yet you aren't satisfied. The Meuse, indeed! What will you be saying next?'

'How far is Argenteau?' put in Dalroy.

'That's it, where the house is on fire,' said the miller, pointing.

'About a kilometre, I take it?'

'Something like that.'

'Have you friends there?'

'Ay, scores, if they're alive.'

'I hear no shooting in that direction. Moreover, an army corps is passing through. Let us go there. Something may turn up. We shall be safer among thousands of Germans than here.'

They walked on. The Englishman's air of decision was a tonic in itself.

The fire on the promontory was now at its height, but a curve in the river hid the fugitives from possible observation. Dalroy was confident as to two favourable factors—the men of the marching column would not search far along the way they had come, and their commander would recall them when the wood yielded no trace of its supposed occupants.

There had been fighting along the right bank of the Meuse during the previous day. German helmets, red and yellow Belgian caps, portions of accoutrements and broken weapons, littered the tow-path. But no bodies were in evidence. The river had claimed the dead and the wounded Belgians; the enemy's wounded had been transferred to Aix-la-Chapelle.

Nearing Argenteau, they heard a feeble cry. They stopped, and listened. Again it came, clearly this time: 'Elsa! Elsa!'

It was a man's voice, and the name was that of a German woman. Maertz searched in a thicket, and found a young German officer lying there. He was delirious, calling for the help of one powerless to aid.

He seemed to become aware of the presence of some human being. Perhaps his atrophied senses retained enough vitality to hear the passing footsteps.

'Elsa,' he moaned again, 'give me water, for God's sake!'

'He's done for,' reported Maertz to the waiting group. 'He's covered with blood.'

'For all that, he may prove our salvation,' said Dalroy quickly. 'Sharp, now! Pitch our firearms and ammunition into the river. We must lift a gate off its hinges, and carry that fellow into Argenteau.'

Joos grinned. He saw the astuteness of the scheme. A number of Belgian peasants bringing a wounded officer to the ambulance would probably be allowed to proceed scot-free. But he was loath to part with the precious fork on which the blood of 'that fat Busch' was congealing. He thrust it into a ditch; and if ever he was able to retrieve it, no more valued souvenir of the great war would adorn his dwelling. They possessed neither wine nor water; but a tiny rivulet flowing into the Meuse under a neighbouring bridge supplied the latter, and the wounded man gulped down great mouthfuls out of a *Pickel-haube*. It partially cleared his wits.

'Where am I?' he asked faintly.

Dalroy nodded to Joos, who answered, 'On the Meuse bank, near Argenteau.'

'Ah, I remember. Those cursed'—Some dim perception of his surroundings choked the word on his lips. 'I was hit,' he went on, 'and crawled among the bushes.'

'Was there fighting here this morning?'

'Yes. To-day is Tuesday, isn't it?'

'No, Wednesday midnight.'

'Ach, Gott! That *verdammte* ambulance missed me! I have lain here two days!'

This time he swore without hesitation, since he was cursing his own men.

Jan came with a hurdle. 'This is lighter than a gate, monsieur,' he explained.

Dalroy nudged Joos sharply, and the miller took the cue. 'Right,' he said. 'Now, you two, handle him carefully.'

The German groaned piteously, and fainted.

'Oh, he's dead!' gasped Irene when she saw his head drop.

'No; he will recover. But don't speak English.—As for you, Jan Maertz, no more of your "monsieur" and "madame." I am Pierre, and this lady is Clementine. You understand?'

Dalroy spoke emphatically. Had the German retained his wits their project might be undone. In the event, the pain of movement on the hurdle revived the wounded man, and he asked for more water. They were then entering the outskirts of Argenteau, so they kept on. Soon they gained the main road, and Joos inquired of an officer the whereabouts of a field hospital. He directed them quite civilly, and offered to detail men to act as bearers. But the miller was now his own shrewd self again.

'No,' he said bluntly; 'I and my family have rescued your officer, and we want a safe conduct.'

Off they went with their living passport. The field hospital was established in the village school, and here the patient was turned over to a surgeon. As it happened, the latter recognised a friend, and was grateful. He sent an orderly with them to find the major in charge of the lines of communication, and they had not been in Argenteau five minutes before they were supplied with a *laisser passer*, in which they figured as Wilhelm Schultz, farmer, and wife; Clementine and Léontine, daughters; and the said daughters' fiancés, Pierre Dampier and Georges Lambert; residence Aubel; destination Andenne.

There was not the least hitch in the matter. The major was, in his way, courteous. Joos gave his own Christian name as 'Guillaume,' but the German laughed.

'You're a good citizen of the Fatherland now, my friend,' he guffawed, 'so we'll make it "Wilhelm." As for this pair of doves'—and he eyed the two girls—'warn off any of our lads. Tell them that I, Major von Arnheim, said so. They're a warm lot where a pretty woman is concerned.'

Von Arnheim was a stout man, a not uncommon quality in German majors. Perhaps he wondered why Joos looked fixedly at the pit of his stomach.

But a motor-cyclist dashed up with a despatch, and he forgot all about 'Schultz' and his family. As it happened, he was a man of some ability, and the hopeless block at Aix caused by the stubborn defence of Liège had brought about the summary dismissal of a General by the wrathful Kaiser. Hence the Argenteau major was promoted and recalled to the base. His next in rank, summoned to the post an hour later, knew nothing of the *laisser passer* granted to a party which closely resembled the much-wanted miller of Visé and his companions; he read an 'urgent general order' for their arrest without the least suspicion that they had slipped through the net in that very place.

Meanwhile these things were in the lap of the gods. For the moment, the six people were free, and actually under German protection.

HOUSE-BOATS *VERSUS* HOUSES FOR HEALTH AND ECONOMY.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

A GREAT many more people live in ships than is generally known. I do not mean vessels which carry merchandise or passengers, and upon which the crews live, but ships moored in one spot for the sole purpose of serving as houses.

The plan of living in a ship has many advantages and few drawbacks. The main point in these economical times is that you have no rent or rates to pay. Then there is the unpleasant question of refuse, which in a house accumulates, and has to be periodically carted away. Afloat, all garbage is simply thrown overboard, to be carried off by the tide. Also, far less work has to be done in a ship than in a house, owing to the compactness of the former; yet one feels little inconvenience from lack of room, because all the space is used to advantage.

Again, next-door neighbours—a frequent source of unpleasantness in small houses on shore—do not exist afloat; at any rate in such close proximity. Another important advantage is the entire absence of unwelcome callers in the form of tramps, peddlers, and other applicants for favours. The constant ringing of door-bells by these people is a nuisance in houses, and causes a serious waste of time.

Living afloat on salt-water is undoubtedly healthy, owing to the salt, which entirely prevents colds in the head, rheumatism, and other ills; in fact, dwellers on the sea seldom have anything the matter with them. As regards rheumatism, we must not be misled by the fact that many old 'shellbacks' suffer from this complaint. It must be remembered that when these men were at sea no fires or other means of warming or drying were provided in the fore-castles of sailing-ships, and this feature prevailed even in vessels rounding Cape Horn, where it is no uncommon occurrence for the rigging to be covered with ice. Under such conditions, apart from being frequently wet to the skin with salt-water, the unfortunate sailors were often soaked by rain or snow, and the only possible way of drying their clothes was to spread them over their beds at night. Experience shows that men who keep reasonably dry when living on the sea are entirely immune from rheumatism. Then the early morning plunge into the sea during the summer months is the finest tonic which has ever been invented, for which the bath of fresh-water in a house seems, and is, a very feeble substitute.

In almost all suitable estuaries round our coasts people may be found living in ships. Some of them are fishermen who prefer to live in their smacks; but many others have no business on the water, and live afloat either because they

like the life or from motives of economy. Some of the ships used for living on are built for this purpose and nothing else, and these are known as house-boats. The genuine house-boat is to be seen at its best on the Thames, where most of them are occupied during the summer. Others are to be found in estuaries near that great yachting centre known amongst yachtsmen as 'the Wight.' On the Thames these craft are especially built for living on, and they cost as much as a house. Elsewhere lighters and barges are utilised for house-boats. Any kind of boat or ship, however, will serve for this purpose, and old yachts are often used in this way. Sometimes a yacht is used for both sailing and living on, in which case the owner has a residence which he can move to any place on the coast. This is a great advantage, and allows one to sojourn in fashionable watering-places without paying exorbitant charges for accommodation on shore.

A Thames sailing-barge makes an excellent house if partitioned off below into separate rooms, and several of these craft are used as houses even by men with wives and families—men who have to be at business in London every day. The writer has lived in a yacht winter and summer for the last six years, and cycled seven miles to his office every morning, and back again in the evening. This plan has proved exceedingly beneficial, colds in the head, toothache, 'flu,' and other minor ailments which were very troublesome when living on shore being entirely eliminated.

Many people will object that they could not stand the motion caused by the waves. If one lives in a small boat on a wide estuary this drawback may hold good, but there would be no motion in, say, a full-sized sailing-barge used as a house. Again, almost every one would very soon get used to the occasional slight rocking about; in fact, many would eventually find it rather enjoyable than otherwise.

In the winter, dwellers in boats have their houses hauled up on the shore at high-water, as there is no object in keeping afloat during the cold season; moreover, if there were any ice about it would damage the vessel. The boat is not hauled right out of the water, but only floated up into some little creek at high-tide. It would never do to haul it right out, as water round the boat at every tide is necessary for carrying away the refuse. The cleansing and disinfecting properties of sea-water are well known, and provided it reaches any garbage thrown overboard every tide no offence is caused.

The mere mention of ice in connection with ships causes the landsman to squirm, and to ask,

'Isn't it frightfully cold in winter?' This is exactly where the house-boat resident scores, as a boat is much more easily and quickly warmed than a house. A coal-stove is, of course, necessary in the smallest boat used for living on, and it renders the interior remarkably snug in cold weather. A blizzard may be roaring outside, and yet the cabins can be oppressively warm, unless skylights and portholes are kept open.

There is only one serious drawback to living in ships or boats, and that is the scarcity of fresh-water. All fresh-water has to be carried on board in barrels known as breakers, and emptied into a tank. This drawback, however, is not nearly so serious as it appears at first sight. One can wash, for example, in a pint of water just as effectively as in a gallon, and it is quite possible to bath in half-a-gallon if one knows how to do it. The plunge every morning into fresh-water is of course impracticable; but, with a full-sized bath for winter use, sea-water is always available, and much more refreshing.

As regards amusements in the form of theatres, concerts, and social gatherings in the winter, living in ships naturally offers the same drawbacks as are experienced by all dwellers in the country; yet many people are perfectly happy in country houses, and prefer the country to the town. There are, moreover, many places suitable for winter berths for house-boats where rail or bus communication exists with towns large enough to offer fairly good entertainments; in fact, few country people are now entirely cut off from diversions of this nature. In the summer there is no lack of company, as one's friends are glad enough to get out into the country, while life afloat offers them a startling and pleasant change from town conditions. Then there are all kinds of outdoor sports and recreations both afloat and on shore.

We cannot all live in ships, but many people situated near the numerous estuaries round our coasts can do so, and those who try it will benefit both in health and pocket.

THE THREE LIEUTENANTS.

By W. F. BATTEN.

I.—THE GERMAN DESTROYER.

THE heavy north-easterly gale that had been blowing for four days and four nights had died down somewhat. Outside the small port of Zeebrugge wraiths of thick white mist rolled up, to pass away in heavy banks and swirls, now almost entirely blotting out the view seawards, anon lifting but to disclose an empty stretch of cold, gray sea. Behind the little town a blur of thick black smoke, rising from beyond a line of bleak sand-dunes, seemed to smudge the low-lying clouds as it rose slowly from the high chimneys of new buildings, before which certain tall posts—wireless aerials—stood out clearly beyond the reach of gun-fire. Sheltered by a sandy point lay the large three-funnelled German destroyer *Uhlan*; and well ahead of her were two torpedo-boats, with steam up ready for sea. In the thick banks of white mists that at times hid these from view, the destroyer almost seemed but 'a phantom ship upon a phantom sea,' so well did the gray hue of her hull and deck structures blend with that of the sky above and the sea beneath her. Upon her bridge an oilskin-clad officer—Lieutenant Carl Friedrich Müller, the second in command of the craft—paced anxiously to and fro. Under his sou'-wester, anxious eyes peered out from a haggard face, the bronzed hue of which had given place to a sickly yellow, whilst all through those restless paces never once did he take his strained eyes off the seaward horizon. A blue-uniformed officer, with gold-braided cuffs, climbed up on to the bridge, and after a formal fingers-to-brow salute they

exchanged friendly nods. 'Any orders yet, Herr Lieutenant?' inquired the new-comer—a heavy man, with a nose that suggested a bird's beak between protruding eyes, who fidgeted continually with the ends of his yellow moustache as he followed the lieutenant to the centre of the bridge.

'We start shortly after these boats,' replied the other in a heavy voice.

'Ach!' said the engineer. 'It is perhaps better, for I cannot sleep here.'

'Sleep!' echoed the lieutenant. 'These four nights and days I have not slept, with those *verfluchte* British destroyers ever slipping through the mist; and always I see them; when I close my eyes, when on duty, I know no longer when I see them, or see them not; worse, too—submarines.' He broke off suddenly. 'Yet the enemy have left the offing; they couldn't keep their stations in such weather.'

'Is it *our* chance, then?' inquired the engineer.

'Yes, perhaps.'

'You fear?'

'Everything in this trap of a port, with the picket-boats all in.'

A sailor in oilskins climbed the bridge and saluted. 'The Herr Commander comes, Herr Lieutenant.'

The engineer disappeared. His companion went to the starboard rail, and saw a motor-boat approaching in a smother of flyingspray. A boat-swain's whistle shrilled loudly, and a moment

later the officer in command came up the ladder on to the bridge, shaking the water from his oilskins and dabbing at his carefully trimmed yellow beard with his handkerchief.

The commander's eyes were hard with the hardness of those of a man who had been contemplating desperate possibilities. His mouth was set, and he spoke curtly.

'Get the starboard anchor up, and tell the Herr Staff-Engineer I wish to speak to him.'

Then he went heavily to the wheelhouse to bend over the chart. The lieutenant blew his whistle, and an instant later the shrill piping of the boatswain's repeated the call; then came the clanking of the capstan hauling in the heavy chain. Here and there a word of the commander's conversation with the chief engineer escaped, and was carried outside the wheelhouse: 'Knots,' 'coal,' 'revolutions,' being emphasised by the commander's curt, 'Do your best.'

'We follow the torpedo-boats?' queried the engineer, as both men came out.

'The orders are to support their attack on the enemy mine-sweepers;' and the commander turned toward the ship's bugler, who stood stiffly at attention, and ordered him to call the men to stations.

The stirring brazen notes of his bugle being taken up and repeated forward, the erstwhile deserted decks swarmed with hurrying men. A buzz of excited voices, not easily hushed, proclaimed that the acute tension of the four preceding days and nights was ended, and that they were free from the persistent pursuit of the enemy's craft; free to do something, instead of wearily waiting, whilst at any minute destruction might be creeping stealthily toward them from under the surface of the sea; whilst they were enduring the unrelieved strain of a constant watch on the horizon for those gray specks in the daytime or a blur closer at hand in the obscurity of the night. Even worse were those awful minutes, big with their fate, when they were flying hot-foot from the enemy's fierce pursuit after the last action Channelwards, which had driven them down after perpetual dodging and constant night alarms, chases, and escapes from more powerful British craft, to shelter beneath the heavy batteries protecting the little Belgian port, the strain of it all being marked in the dark-rimmed eyes and drawn, set faces of officers and men alike. The alacrity shown then, too, was far from that of men who spring forward calmly and confidently to confront a crisis; rather it resembled the nervous tension of neurotics, glad to translate that nerve force into physical action as an escape from brooding dread. Volumes of thick smoke rolled out from the three funnels of the destroyer, and were blown by the keen, cutting wind in a heavy pall toward the low shore, and soon she got into her stride. The torpedo-boats had vanished fully an hour since,

disappearing in driving sea and drifting banks of thick white mist. The wireless talked to one of them, and got the reply, 'No enemy in sight.'

The lieutenant, however, still peered anxiously into the veiled horizon, every now and then glancing back into the welter of black smoke issuing from all three funnels, and muttered curses, that might have been perverted prayers for deliverance from 'that trap of a coast.' The wireless was still talking, but the tenor of its message had changed to: 'Enemy torpedo-boat and mine-sweepers just sighted. We have hoisted neutral flags.'

The commander went to the engine-room telephone and spoke to the 'chief.' In answer, the masses of black smoke from the funnels rolled out more densely than before. The line of flying water at the bows became a little higher, and remained so. In the open sea they felt the full force of the stiff breeze, and the destroyer drove into great waves that leapt green and ice-cold from her bows, or fell with smashing force on her deck as she endeavoured to combine a steady roll with a violent pitching; and the lieutenant on the bridge clutched at the rail with one hand, whilst with the other he held his glasses to his eyes. For the veils of driving mist which swept continuously across the waters might hide a menace that would mean swift destruction.

Then eight bells sounded, and the lieutenant was relieved. He came down from the bridge, and stood for a moment or two against the warm side of the forward funnel. His eyes burnt in his head, as he stumbled down the companion-way rubbing them. He took off his dripping oilskins outside the ward-room door. His servant appeared, and he ordered him to fetch a tumbler of neat brandy. Then he went into the empty ward-room, flung himself upon a settee, and tried to sleep, but found himself persistently staring at a paint-blisters on the bulkhead. He could not sleep, do all he would. Even the strong dose of spirit failed to steady his nerves; rather it spurred his harassed brain into greater activity. He fretted for a feeling of drowsiness that would not come, till at last, with an oath, he got up, walked out of the ward-room, and made his way down to the engine-room. A stifling atmosphere—hot, damp, and thick with the smell of oil—almost choked him as he descended the steep iron ladder. The sweat broke out on his brow as he passed along a gloomy corridor, just wide enough for one man, between packed boiler-tubes ranged on both sides to meet the roof. He emerged finally into a large space, brilliant with electric light, on a platform at the end of which stood the chief engineer with one of his assistants, surrounded by a cluster of indicator dials, telegraphs, telephones, speaking-tubes, and numerous other fittings. The engineer was still fidgeting with the ends of his upturned moustache as he gazed below him, down to where

the turbines hummed in their casings. From a man-hole at the other end of the engine-room a couple of stokers were drawing out what looked like a corpse, the naked upper part of the body being as black as any negro's; it was a stoker who had collapsed. The staff-engineer frowned angrily as the limp body was carried off to the doctor. Then he turned, and answered the question of the lieutenant, saying irritably, 'Two hundred and fifty revolutions, and not a fraction more, can we get out of this *Gottverfluchte* coal, and that is the fifth man in the last fifteen minutes. There's no use in worrying me; we can do no more. Go and tell the Herr Commander *that*, and leave me to do my work.'

Then, as the lieutenant climbed the ladder to the bridge, he heard a roar in the air, and a moment later a yellow sheet of flame leapt up just in front of him, by the forward funnel, with a deafening detonation. He picked himself up, bruised and dazed, but otherwise uninjured; then steadied himself, and looked for the enemy in the distance with his glasses. On the far horizon he could distinguish a long, low, gray streak, and above it a cloud of brownish smoke, whilst at one end of that gray streak appeared tiny twinkles of bright flame. A moment later the whine of flying shells sounded in his ears. Instantly he flung himself prone on the deck in the shelter of a gun-shield. Then he felt the ship under him shiver and stagger in a deafening roar, a great column of water rose above him, and he knew no more.

II.—THE MINE-SWEEPER.

It was most bitterly cold, with a raw, white mist that at times entirely hid objects not a mile away, and at others allowed an almost normal range of vision. Although there was nothing like a gale then blowing, the long swell coming from seaward—the result of the north-easterly gale that had been raging for the last few days—made life in such a small craft as H.M.S. *Newcastle* extremely uncomfortable when, rolling heavily, she steamed out to her accustomed beat. For H.M.S. *Newcastle*, despite her rather imposing name, was neither Dreadnought, battle-cruiser, light cruiser, sea-keeping destroyer, nor even a liner withdrawn from the passenger service for naval work, but just a perky little tub of a craft, long-backed, ugly and dingy in seeming, though extremely seaworthy and serviceable in reality, when engaged in the dangerous work of mine-sweeping. She had her engines poked away in her stern, by reason of her owner's laudable desire that she should be able to stow away an amount of cargo out of all proportion to her size, she having, up till a month or two previously, swept the North Sea in every kind of weather for cargoes of fish. She was still sweeping it, and in every variety of dirty weather, but for far more dangerous catches than those of former days, being one of

that gallant mine-sweeping fleet of steam-trawlers, about whose deeds so little is said in the public press, but whose fine and patriotic work is fully appreciated at the Admiralty, which possesses a record of quiet and discreet men on equally unassuming little craft, that have both worked wonders.

The *Newcastle*, her commander—a navigating lieutenant—with her skipper and crew, were all of this brand. She and three others were at their dangerous work, when out of the white mist, that had suddenly thickened, there quite unexpectedly appeared two large torpedo-boats flying the Dutch flag, and apparently coming from the direction of the North Hinder Lightship. Now, as the enemy torpedo craft were then all supposed to be safely bottled up on the Belgian coast, neither the little, old British torpedo-boat acting as their convoy nor the steam-trawlers had any suspicion of the strangers, till—in the nasty German way, whilst their neutral flags were still flying—they discharged their torpedoes at the escort, sank her out of hand, and then turned to finish the mine-sweepers. They promptly sent the nearest and all on board her, except one deck-hand, to the bottom, and then swung round to sink the rest. But they could not this time creep up unsuspected under a neutral flag; so the other mine-sweeping vessels were now ready for them. These could not meet the enemy on fair terms as to guns and men; but when it came to seamanship in handling a vessel—any sort of vessel in any sort of sea—the Huns had a lot to learn from British naval officers, and they did learn a good deal that day. They had the speed, they had the guns, and they ought to have been able to sink the trawlers out of hand; but then the British had the 'sea brains.' So they did not sink any more, or even kill any more of their men. The Huns had picked out the *Newcastle* for their first victim, and they made for that perky little craft, quite confident of an easy job. But the lieutenant in command happened to be about as cute as they make 'em; and for all his craft's stodginess and slowness in comparison with these flyers, he fairly outmanœuvred the Huns. And so, when they fired torpedoes, these weapons missed him. They tried again, and this time raked the trawler with their guns, and, after a number of misses, managed to hit her several times, chipping pieces from her ironwork, holing her topsides, and sending splinters flying across her decks. The skipper was hit at the wheel, and sank down beside it; so the *Newcastle* swerved from her course as the wheel slipped from his grasp. But she didn't yaw to count for all that, because the lieutenant in charge took her in hand at once, and, her own skipper being safely stowed away below, took the helm himself. Now the two German craft were out to kill, being, as it were, escaped from custody, and they came on again and again, making all

possible use of their speed, and all the while their guns spat out viciously, so that all around that blunt-nosed trawler the bright flashes of the shells starred and burst. Then once more both the Huns manœuvred to torpedo, intending to send her aloft in one heavy burst. But the British lieutenant spotted their game; and, as his craft lumbered and staggered along, her tiny pop-gun was used to such good purpose as almost to sting the pursuing Huns to madness. For he at the wheel came of a race bred and born to the sea for long centuries, and such as no mush-room upstarts of an inland race could venture to challenge for the supremacy of it with any hope of success.

Under a rain of small shells that ought to have wiped him out had he as many lives as the proverbial cat, that lieutenant cheerfully manœuvred his little, blunt-nosed trawler to such purpose as fairly seemed to leave the Huns standing still and gasping, while, unflurried, unhurried, and heeding the crashing shell-bursts as little as showers of spray, he made his bluff little vessel as quick and clever as a yacht, and as slippery as soap, too. In vain the Huns loosed their torpedoes; she dodged them, and just slipped clear away. Then he shook himself clear, and patiently played for safety, whilst his petty officer let the nearest torpedo-boat have it with his three-pounder, pumping out the small shells in such rapid and accurate fashion that the enemy got the surprise of his lifetime from this puny and despised antagonist. For another ten minutes or so the torpedo-boats did their best to finish the elusive little mine-sweeper; but their best proved to be not good enough. The *Newcastle* beat them by points; and even then they had not done with her commander, for he had succeeded in getting in touch with the senior officer of four powerful British destroyers on patrol duty, and had passed along the news, with the needful sailing directions, before his wireless was put out of action. At last the German torpedo-boats, despairing of sinking their elusive little antagonist, gave up the game, and made off rapidly in the direction of a much larger craft of their own class, which the rising mist had just rendered visible in the extreme distance, their retreat having been possibly not uninfluenced by the activity of the *Newcastle's* wireless. But when once the *Newcastle's* commander had made sure that the British destroyer patrol had taken up the running, he and his blunt-nosed little craft went back to that quiet and difficult game of life and death, otherwise known as mine-sweeping.

III.—THE BRITISH DESTROYER PATROL.

The patrol line had been divided into two eight-mile beats, each of which was patrolled by two destroyers; the reserve lay much further back shorewards, but with steam up and ready for action were the outer patrol to be driven

in. The new ocean-going destroyer *Erebus*, nine hundred and ninety tons, thirty knots, and carrying four four-inch thirty-pounder guns and as many twelve-pounders, was patrolling with her sister-ship the *Terror*, being employed on No. 1 Patrol seaward; and Lieutenant-Commander Albert Edward Paulet, being the senior of the commanding officers, was consequently in charge. The responsibility, however, did not unduly weigh upon him, for he had been in the same position on many previous occasions. At that particular moment he was wedged in one corner of the heaving bridge, and looking out serenely enough seaward, though chilled to the very bone by the raw, damp, cold of the penetrating sea mist. His command had hitherto been unlucky, for he had not been present at the last action, or, indeed, any other since hostilities had commenced; whilst his nearest consort had been having what her crew denominated a 'high old time,' she having been in no fewer than three cruiser and destroyer actions. But the day after hostilities had commenced, the *Erebus* had developed a somewhat serious defect in her engine-room, and had been forced to return to Chatham to have it put right. Consequently, to the utter disgust of her officers and men, she had missed 'the fun' up till then; and by the time she was at sea again, the enemy had disappeared into their fortified harbours, or were under the shelter of heavy batteries and behind mine-fields, from which no sortie had as yet been made.

'I wish they'd come out from yonder and give us some sort of a show,' grumbled the commander, jerking his head toward the coast of Belgium. 'There's no getting at'— But before he could finish, a message was brought him from the wireless room, running: 'British torpedo-boat and mine-sweeper sunk by two German torpedo-boats;' this being followed by careful directions as to the course necessary to take to intercept them.

'Hallo! here's luck!' he resumed, with all the glee of a schoolboy, despite his 'senior and responsible position;' and turning to his navigating officer, he added, 'We may be in for a scrap, after all.' Then, recollecting himself, he curtly added, 'Call Mr Waters.' The navigating officer to whom he had been talking did not let the grass grow under his feet, and in the twinkling of an eye the call to general quarters sounded, and 'rush and tumble was the word.' Among the guns and torpedo-tube crews then mustering at their stations the news was soon passed that 'those blighters' had ventured out at last, for the old man 'had just got a wireless.' But the 'old man' took care to give very precise instructions to the gunnery officer, and himself arranged the adjustment of the torpedoes. For, despite his occasional levity and boyishness, he was a commander who gave away no points in the game, and that the admiral on the station very well knew; hence his present position.

The *Erebus* was now putting her best foot forward, riding over or cutting through the lumpy seas at well-nigh thirty knots. No very long time, therefore, elapsed before the dull boom of guns came down the wind. Half-an-hour later the firing had increased in intensity, and flash after flash broke through the rapidly thinning mist, the reports following each other in an almost uninterrupted rumble; then, however, gradually dying down, and finally ceasing altogether. His powerful marine-glasses now showed the commander a British mine-sweeper, the rearmost of several, making off shorewards at full speed, and two enemy torpedo-boats also making off in the opposite direction, apparently to join a much larger ocean-going destroyer barely visible in the distance.

'We've got 'em, Parker,' quietly remarked 'the old man' to his second in command. 'The three short funnels and the mast abaft all give them away; they're none of ours. I shall tackle the large destroyer. Signal the *Terror* to take on both torpedo-boats—till the *Pluto* can butt in, anyway; and, turning to the telegraph indicators, the lieutenant-commander jammed both over to full speed. The vessel, now gathering way, turned on a course parallel to the enemy destroyer; but the quartermaster had hardly righted his helm, when a deafening crash, followed by a sheet of flame, burst out close on the port beam. 'Let 'em have the for'ard guns in reply,' was the commander's prompt order, as with a prolonged whine another hostile projectile flew over his head. The guns opened fire almost before he finished speaking, crash after crash rending the air, followed by darting flashes of flame. The for'ard four-inch guns had spoken, and the gunner growled, 'Up a 'undred,' as he saw his shells pitch short. This time the aim was better, for the reports of the guns were followed by broad sheets of flame and ugly crashes on the enemy's deck, where the shells had burst squarely.

The action had now become general. All three of the enemy's craft were vomiting smoke and flame, to which the *Erebus* and *Terror* replied with their broadsides; and the *Pluto*, then some distance to leeward, joined in with her bow guns. The noise of the firing had become deafening, when suddenly there was a brilliant yellow glare on the *Erebus's* fore-castle, just under one of the four-inch gun platforms, followed by a heavy detonation. Her commander instinctively raised his hands to shield his face. As he did so something soft and horribly wet struck his forehead, and putting up his hand, he found it covered with blood. The Huns' shell had got home—two of the gun-crew had been literally blown to pieces, and a third lay writhing in his death-agony. The commander felt a sharp pain in his shoulder, and blood slowly trickled down his left sleeve as he staggered back to the bridge dazed and half-stunned. 'The port four-inch is

out of action, sir,' reported the gunner. 'I know it is,' shortly replied the commander. 'Pass the word to the torpedo-tube crews.' They had been waiting for the order; and almost before it had reached him the officer in charge had pulled his lever, and the deadly missile entered the water with a sharp splash, speeding its way at over forty miles an hour toward the now sorely stricken enemy. There was a nerve-trying pause, and then a terrific detonation. Two enormous columns of flame and water rose into the air simultaneously where the doomed destroyer had been struck. The torpedo had done its work only too well. The large new German destroyer *Uhlán* had been blown into two halves; the bows stood upright in the water, the gray stem pointing skyward momentarily; then both the fore and aft parts of her rapidly sank. Shaken by the concussion, the commander of the *Erebus* leant for a moment or two against the weather-screen; then, quickly recovering himself, telegraphed to put the engines astern.

The *Erebus* quivered with the sudden strain as the propellers were reversed; and her commander, going to the rail, gave orders that such boats as would float were to be lowered to search for any survivors. But very few of the crews of either the *Uhlán* or her two smaller consorts who had sunk the little, old British torpedo-boat and mine-sweeper, and who subsequently suffered the same fate themselves at the hands of the *Terror* and *Pluto*, were saved. Neither was Lieutenant Müller or any other commissioned officer amongst those that were rescued.

OUR MEN.

THEY watch o'er us!
Upon the waste of waters,
Through sultry nights, through days of blinding heat,
Or where the winds, far up in northern quarters,
Over the waves weave their gray winding-sheet;
They keep their guard as faithful, true, and tender
As mother o'er her child.
Watch, Thou, o'er them, O Father and Defender,
Who watch o'er us!

They fight for us!
On sea, in trench, o'er mountain,
They struggle on through storm and shot and shell;
O'er sandy desert, past the poisoned fountain,
They still press on against the hosts of hell;
They fight for Right, holding their flag the faster,
As fought the saints of old.
Fight, Thou, for them, our Captain and our Master,
Who fight for us!

They die for us!
Ah, thought of awful sorrow!
In their fair youth they die, in their full age,
In torment and alone, that our own morrow
May bear no shame or stain upon its page!
Laying their lives down gladly for some other
Poor friend, perchance unknown.
Receive their souls, their Saviour and their Brother—
They died for us!

SEVENTH SERIES

HELIGOLAND IN PEACE AND WAR.

AS it seems more than likely that before long important events will take place there, it may prove of interest to describe this till lately famous bathing resort and at present impregnable fortress—at least, in the belief of the German Admiralty—which lies in that, to us, important part of the North Sea facing the mouths of the Elbe and the Weser, or, in other words, the entrance to the Kaiser Wilhelm Canal and the German naval bases of Cuxhaven and Wilhelmshaven. In or near this stretch of sea quite possibly the greatest naval battle the world has ever seen may yet be fought. Amongst all the startling changes that the great war has brought about, the conversion of a spot once the abode of peaceful beauty and innocent enjoyment into a hideous and menacing fortress of the most up-to-date type must certainly have a place. The island was taken by the British from the Danes in 1807, and was formally ceded to Britain in 1814. In 1890 it was ceded to Germany, and since 1892 has formed part of the Prussian province of Schleswig-Holstein.

Now, when our Foreign Office was induced to hand over Heligoland to the greedy Teuton, who had long coveted it—'Mr Punch' sarcastically described the act as 'giving it away with a pound of tea'—our Foreign Office, by so doing, deprived this country of a most needful naval base which would have proved of the greatest value at the present time. For not only was there, at Dünen Insel, snug anchorage for the largest vessels during coaling and the taking in of stores, but as a post of observation on this end of the Kaiser Wilhelm Canal and the other German naval bases it would have been a perpetual thorn in the side of the enemy during the war, as a glance at the map will show. Formerly Heligoland was considered the very best marine bathing resort in Europe, not only for its safe, gently sloping beach of silver sand, but for its life-giving air; so that, despite its being nearly thirty miles from the mainland, and the fact that the German people are notoriously poor sailors, between thirty and forty thousand of them used to come across every year by the daily steamers during the ten weeks' season, which commenced about the middle of June. The resident population, however, only numbered about two thousand five hundred, and not a single soul of these now remains; for, in the usual Prussian 'frightful'

way, they were, at a moment's notice, deported six hours after war was declared. These were of the old Frisian stock, and spoke a dialect of Frisian; but English was the usual language, just as German has been of recent years the official one. But the Heligolandians were British at heart, as had been their parents before them, for eighty-three years of good government and unfettered personal liberty had naturally made them so. At the time of the transfer they presented a petition to be allowed to remain under the British flag; but Governor Parker declined to forward it, on the ground that it would make their lot still harder under their new Prussian masters! Heligoland—by one derivation Holy Land, by another Halligland (land of banks which cover and uncover)—was then the most picturesque of 'toy' islands, being only about a mile long by a third of a mile broad; and when seen some little distance off from a steamer's deck the doll-like appearance of the people on it seemed most appropriate. There is a pretty legend, too, that the national colours are taken from the red hue of the sandstone cliffs, the white of the sands beneath them, and the green of the miniature wood that used to be on the Oberland.

The rocks all round the sandstone cliffs have been carved in most fantastic fashion by the—until recent years—ever-encroaching sea, which, however, is now rendered incapable of further ravages, thanks to Teutonic thoroughness in seawall construction. The effect produced when these fantastic arches, caves, and grottos were brilliantly illuminated on the 10th of August every year was very wonderful. Doubtless such tremendous upheavals of the sea as occurred in 1720 had much to do with their formation; they certainly broke away the neck of land that then connected the Dünen Insel with the rest of Heligoland, leaving that splendid bathing beach twelve hundred yards off, across a channel twelve to fourteen feet deep.

The larger part of Heligoland is a long, narrow triangle which slopes somewhat from west to east; the summit, or Oberland, averages about one hundred and ninety feet above sea-level. The church on its highest point, being about two hundred and fifteen feet above the water, used to be a handy landmark for sailing-yachts, owing to its very conspicuous spire. The soil on the flat top of the rock sufficed for a

little pasture-land, and for growing potatoes and cabbages. There used to be a few sheep on the island, and a few cows. Wheelbarrows were the only wheeled vehicles. The only beach is on the Unterland, a sandy spit near its south-east point, where the landing-stage is situated, and where there was good accommodation for bathers when the sea was too rough to cross the ferry with comfort. From the lower town, the Oberland, or upper one, was reached either by one hundred and eighty-two wooden stairs or by a steam-worked lift. The 'Queen Victoria' and the 'Princess Alexandra' were the most comfortable hotels, and the restaurants were good and always full. The theatre was an excellent one; and after the Prussians' advent a fine *Konversation Haus*, ballroom, concert and music halls, in the Kaiser Strad a North Sea Museum and Aquarium, and a powerful new lighthouse and an important wireless station, were added. The Dünen Insel is in reality a sandbank protected by groins, and the drifting sand makes its height vary; usually, however, it is about two hundred feet. But the great bathing establishment on its long, shelving beach of fine white sand was probably unique in its accommodation for both visitors and residents, who crowded into it in the season.

But what struck the British tourist most in Heligoland was the quaint old houses, with their balconies and gables and gaily painted fronts, the picturesque old church, and the quaint costumes of the girls and women in their national dance, the *Slim Mien Moderken*. The hardy seafaring partners of these, of military age, have, however, now been pressed into the German navy, despite the fact that many of them who were British-born subjects had elected to remain so. The townsfolk in those days had an odd fashion of hanging up enormous festoons of fishing-nets upon lofty poles right in front of the best houses in the Unterland, which was rather upsetting to a stranger till he got used to it. But then, from the pastor's house, with the great mulberry-tree before the porch, to the queer build of the fishing-craft that brought in haddocks and cod, and sometimes turbot, quaintness was everywhere the characteristic of this little 'toy' island. It was said that when the British Coastguard, with a system of life-saving, was established, and a lighthouse built which greatly reduced the number of wrecks and helped in the rescue of many shipwrecked sailors, such newfangled notions were eyed askance by the islanders of Nelson's day. Despite, however, some big modern residences, Government House and official buildings, on the Oberland, the island, looked at as a whole, somehow seemed to suggest a pretty set-scene in a theatre, and, like that too, it has suddenly changed.

We now see in its place the new Heligoland of Prussian militarism, just a tremendously strong

fortress in the North Sea, from which not only have all the civilian inhabitants been deported, but every house, building, and tree, both in the line of fire or that might be considered likely to hinder clear views of the sea from any point, has been ruthlessly pulled down to make room for new works or to leave all the approaches clear. The fortress, too, is most scrupulously guarded from observation from outside; indeed, no stranger has been allowed to land there since the beginning of July 1914—a pretty clear indication of the known coming of The Day! Yet though espionage and raids from British cruisers and small craft are guarded against in the most elaborate manner, both have taken place, as the—for the German navy—disastrous 'Battle of the Bight' and the abstraction of the plans of the fortress from the representatives of the firm employed to install the heating apparatus there prove. That the garrison is 'nervy' the scene when darkness sets in is sufficient indication; for in all directions torpedo-craft with lights out cross each other, recross, and interchange signals incessantly, being on tenterhooks meanwhile through fear of British submarines and fleet above-water craft. Lights, too, ashore send signals that are constantly answered by flashes from the sea. So 'jumpy,' however, do these numerous patrols become at times that two of the torpedo-boats all but ran each other down a few months ago, the result of their violent collision being that one made Wilhelmshaven in a sinking condition, and the other in only a little less helpless state. For the approaches to Heligoland at night are kept in pitchy darkness, and the whole routine of rigorous precaution is never relaxed. No civilian is ever seen ashore, certain former civilian engineers and skilled mechanics whose services are required being attached to the garrison, or, rather, to the German Admiralty, in whose hands the fortress now is. The only females allowed in it are some half-dozen nurses belonging to the hospital staff.

But from morning to night the work of improving the fortifications goes uninterruptedly on. The Krupp steel-armoured turrets, with their heavy guns, though of a very different thickness and calibre from those of Liège and Antwerp, are no longer depended upon, not being considered capable of replying effectually to the fifteen-inch guns of the *Queen Elizabeth* and her consorts, and they have therefore been superseded by the heaviest fortress weapons Krupp turns out both in guns and howitzers. The fear of danger from the air—reasonable enough no doubt so far as the future is concerned—is evidenced by the numerous and powerful anti-aircraft guns and the system of giant searchlights worked in connection with these. In fact, all the lessons learnt in the Russian campaign and the attack on the Dardanelles are being carefully utilised here; whilst

the whole island seems filled with the naval officers, seamen, and marines composing the garrison. Despite every precaution of the authorities, however, news of these great preparations against an expected attack has leaked out, for there are those in the garrison who would rejoice at the fall of the fortress. When it is borne in mind how the German Government has not only forced all the men of Danish blood between the ages of eighteen and forty-five (even those before rejected as medically unfit) in the now Prussian province of Schleswig-Holstein, of which, as we have said, Heligoland has formed part since 1892, to fight against Great Britain, but of set purpose has sent these unfortunate men into the most exposed positions to be sacrificed remorselessly, it is little to be wondered at that there exists an Achilles heel in Heligoland to-day, for all its inaccessible cliffs, mine-fields, and bristling array of heavy guns, its aircraft, submarines, barbed wire, and poison gas, which certainly should make Prussian Heligoland a difficult nut to crack. Though, after all, in the last resort, it is on man-power that it must rely for safety, and here *moral* is going to be the decisive factor. As to this, it seems now to be necessary to keep up the spirits of the garrison

by good military bands that play every afternoon till darkness sets in, when the dreaded nerve-trying ordeal of watching and waiting for the expected British attack begins afresh each evening. But report has it that the fair fame of the British navy, that is never sullied by the refusal of mercy to defeated enemies in time of battle, has far more to do with sustaining the courage of the German patrol-boats' crews during the present long dark nights than all the martial music of the crack bands ashore. But whether such an attack comes or not, it would seem to be the bounden duty of the people of this country to insist that Heligoland and its ill-used inhabitants, a large proportion of whom are our fellow-subjects, should again come under British rule. Thus the injustice of handing over these peaceful folk against their will to the despotic militarism of *Kultur*-ridden Prussia shall be finally redressed. Moreover, whenever these Heligolanders surrender during the war, which they will do if it is possible, they should not be treated as enemies, for they are not to blame for being in the enemy's ranks, as it was either that or having to face a firing-party without even a form of trial had they refused their services.

THE DAY OF WRATH.

CHAPTER IX.—AN EXPOSITION OF GERMAN METHODS.

THREE large and powerful automobiles stood at rest in the tiny square of Argenteau. Nearly every little town in Belgium and France possesses its *place*, the hub of social and business life, the centre where roads converge and markets are held. In the roadway, near the cars, were several officers, deep in conversation.

'Look,' murmured Irene to Dalroy; 'the high-shouldered, broadly built man, facing this way, is General von Emmich!'

By this time Dalroy was acquainted with the name of the German Commander-in-Chief. He found a fleeting interest in watching him now, while Joos and the others loitered irresolutely on the pavement outside the improvised office of the *Kommandantur*.

Though the moon was high and clear, there was no other light, and the diffused brilliance of the 'orbèd maiden, with white fire laden,' is not favourable to close observation. But Von Emmich's bearing and gestures were significant. He put an abrupt end to the conclave by an emphatic sweep of his right arm, and the larger number of his staff disposed themselves in two of the cars, in which the chauffeurs and armed escorts were already seated. They made off in the direction of Aix. It was easy to guess their errand. More cannon; more cannon-fodder!

The Generalissimo himself remained apart from the colonel and the captain who apparently formed his personal suite. He strode to and fro, evidently in deep thought. Once he halted quite close to the little company of peasants, and Dalroy believed he saw tears in his eyes, tears instantly brushed away by an angry hand. Whatever the cause of this emotion, the General quickly mastered a momentary weakness. Indeed, that spasmodic yielding seemed to have braced his will to a fixed purpose, because he walked to the waiting car, wrote something by the light of an electric torch, and said to the younger of the staff officers, 'Take that to the field telegraph. It must have priority.'

Somehow, Dalroy sensed the actual text of the message. Von Emmich was making the humiliating admission that Liège, far from having fallen, as he had announced during the first hours of the advance, was still an immovable barrier against a living torrent of men. So the heart of this middle-aged warrior, whose reputation was good when measured by the Prussian standard, had not melted because of the misery and desolation he and his armed ruffians had brought into one of the most peaceful, industrious, and law-abiding communities in the world. His tears flowed because of failure, not of regret. His withers were

wrung by mortification, not pity. He would have waded knee-deep in the blood of Belgium if only he could have gained his ends and substantiated by literal fact that first vainglorious telegram to the War Lord of Potsdam. Now he had to ask for time, reinforcements, siege-guns, while the clock ticked inexorably, and Britain, France, and Russia were mobilising. Perhaps it was in that hour that his morbid thoughts first turned to a suicide's death as the only reparation for what he conceived to be a personal blunder. Yet his generalship was marked by no grave strategical fault. If aught erred, it was the German State machine, which counted only on mankind having a body and a brain, but denied it a soul.

Von Emmich's troubles were no concern of Dalroy, save in their reaction on his own difficulties. He was conscious of a certain surprise that Irene Beresford should have recognised one of the leaders of modern Germany so promptly; but this feeling, in its turn, yielded to the vital things of the moment. 'Let us be moving,' he said quietly, and led the way with Joos.

'Why did you give Andenne as your destination?' he inquired.

'My wife's cousin lives there, monsieur. She is married to a man named Alphonse Stauwaert. I *had* to say something. I remembered Madame Stauwaert in the nick of time.'

'But Andenne lies beyond Liège. To get there we shall have to traverse the whole German line, and pass some of the outlying forts, which is impossible.'

'We must go somewhere.'

'True. But why not make for a place that is attainable? Heaven—or Purgatory, at any rate—is far more easily reached to-night than Andenne.'

'I didn't say we were going there at once,' snapped the miller. 'It's more than twenty-five kilometres from here, and is far enough away to be safe when I'm asked where I am bound for. My wife couldn't walk it to-morrow, let alone to-night.'

'Andenne lies down the valley of the Meuse too, doesn't it?'

'Ay.'

'Well, isn't that simply falling off a rock into a whirlpool? The Germans must pass that way to France, and it is France they are aiming at, not Belgium.'

'They talk mostly about England,' said Joos sapiently.

'Yes, because they fear her. But let us avoid politics, my friend. Our present problem is how and where to bestow these women for the night. After that, the sooner we three men leave them the better. I, at least, must go. I may be detected any minute, and then—God help you others!'

'*Saperlotte!* That isn't the way you English

are treating us. No, monsieur, we sink or swim together.'

That ready disavowal of any clash of interests was cheering. The little man's heart was sound, though his temper might be short. Good faith, however, was not such a prime essential now as good judgment, and Dalroy halted again at a corner of the square. To stay in Argenteau was madness. But—there were three roads. One led to Visé, one to Liège, and one to the German frontier! The first two were closed hopelessly. The third, open in a sense, was fantastic when regarded as a possible avenue of escape. Yet that third road offered the only path toward comparative security and rest.

'I wish you wouldn't look so dejected,' whispered Irene, peeping up into Dalroy's downcast face with the winsome smile which had so taken his fancy during the long journey from Berlin. 'I've been counting our gains and losses. Surely the balance is heavy on our side. We—you, that is—have defeated the whole German army. We've lost some sleep and some clothes, but have secured a safe-conduct from our enemies, after knocking a good many of them on the head. Some men, I know, look miserable when most successful; but I don't put you in that category.'

She was careful to talk German, not that there was much chance of being actually overheard, but to prevent the sibilant accents of English speech reaching suspicious ears. Britons who have no language but their own are often surprised when abroad at hearing children mimicking them by hissing. Curiously enough, such is the effect of our island tongue on foreign ears. Monosyllables like 'yes,' 'this,' 'it's,' and scores of others in constant use, no less than the almost invariable plural form of nouns, lead to the illusion, which Irene was aware of, and guarded against.

Yet, despite the uncouth, harsh-sounding words on her lips, and the coarse Flemish garments she wore, she was adorably English. Léontine Joos was a pretty girl, but, in true feminine parlance, 'lumpy.' Some three inches less in height than her 'sister,' she probably weighed a stone more. Léontine trudged when she walked; Irene moved with a grace which not even a pair of clumsy sabots could hide. Luckily they were alike in one important particular. Their faces and hands were soiled, their hair untidy, and the passage through the wood had scratched foreheads and cheeks until the skin was broken, and little patches of congealed blood disfigured them.

'I may look more dejected than I feel,' Dalroy reassured her. 'I'm playing a part, remember. I've kept my head down and my knees bent until my joints ache.'

'Oh, is that it?' she cooed, with a relieved air. How could he know then that the sabots were chafing her ankles until the pain had

become well-nigh unbearable? If she could have gratified her own wishes she would have crept to the nearest hedge and flung herself down in utter weariness.

Joos, having pondered the Englishman's views on Andenne as an unattainable refuge, scratched his head perplexedly. 'I think we had better go toward Herve,' he said at last. 'This is the road;' and he pointed to the left. 'On the way we can branch off to a farm I know of, if it happens to be clear of soldiers.'

Any goal was preferable to none. They entered the eastward-bound road, but had not advanced twenty yards along it before the way was blocked by a mass of commissariat wagons and scores of Uhlans standing by their horses.

Two officers, heedless who heard, were wrangling loudly.

'There is nothing else for it, Herr Hauptmann,' said one. 'It doesn't matter who is actually to blame. You have taken the wrong road, and must turn back. Every yard farther in this direction puts you deeper in the mire.'

'But I was misdirected as far away as Bleyberg,' protested the other. 'Some never-to-be-forgotten hound of hell told me that this was the Verviers road. *Gott im himmel!* and I must be there by dawn!'

Dalroy was gazing at the wagons. They seemed oddly familiar. The painted legend on the tarpaulins placed the matter beyond doubt. These were the very vehicles he had seen in the station-yard at Aix-la-Chapelle!

At this crisis Jan Maertz's sluggish brain evolved a really clever notion. The Germans wanted a guide, and who so well qualified for the post as a carter to whom each turn and twist in every road in the province was familiar? Without consulting any one, he pushed forward. 'Pardon, Herr General,' he said in his off-hand way. 'Give me and my friends a lift, and I'll have you and your wagons in Verviers in three hours.'

Brutality is so engrained in the Prussian that an offer which a man of another race would have accepted civilly was treated almost as an insult by the angry leader of the convoy.

'You'll guide me with the point of a lance close to your liver, you Belgian swine-dog!' was the ungracious answer.

'Not me!' retorted Maertz. 'Here, papa!' he cried to Joos, 'show this gentleman your paper. He can't go about sticking people as he likes, even in war-time.'

Joos went forward. Moved by contemptuous curiosity, the two officers examined the miller's *laissez passer* by the light of an electric torch.

The commissariat officer changed his tone when he saw the signature. The virtue of military obedience becomes a grovelling servitude in the German army, and a man who was ready to act with the utmost unfairness if left

to his own instincts grew almost courteous at sight of the communications officer's name. 'Your case is different,' he admitted grudgingly. 'Is this your party? The old man is Herr Schultz, I suppose. Which are you?'

'I'm Georges Lambert, Herr General.'

'And what do you want?'

'We're all going to Andenne. It's on the paper. This infernal fighting has smashed up our place at Aubel, and the women are footsore and frightened. So is papa. Put them in a wagon. Dampier and I can leg it.'

The Prussian was becoming more civil each moment. He realised, too, that this gruff fellow who moved about the country under such powerful protection was a veritable godsend to him and his tired men.

'No, no,' he cried, grown suddenly complainant; 'we can do better than that. I'll dump a few trusses of hay, and put you all in the same wagon, which can then take the lead.'

Thus, by a mere turn of fortune's wheel, the enemy was changed into a friend, and a dangerous road made safe and comfort-giving. Jan sat in front with the driver, and cracked jokes with him; while the others nestled into a load of sweet-smelling hay.

'For the first time in my life,' whispered Dalroy to Irene, 'I understand the precise significance of Samson's riddle about the honey extracted from the lion. Our heavy-witted Jan has saved the situation. We enter Verviers in triumph, and reach the left of the German lines. Just another slice of luck, and we cross the Meuse at Andenne or elsewhere—it doesn't matter where.'

Irene had kicked off those cruel sabots. She bit her lip in the darkness to stifle a sob before answering coolly, 'Shall we be clear of the Germans then?'

'I—hope so. Their armies dare not advance so long as we hear those guns.'

The girl could not reason in the soldier's way. She thought she would 'hear those guns' during the rest of her life. Never had she dreamed of anything so horrific as that drumming of cannon. She believed, as women do, that every shell tore hundreds of human beings limb from limb. In silent revolt against the frenzy which seemed to possess the world, she closed her eyes and buried her head in the hay; and once again exhausted nature was its own best healer. When the convoy rumbled into Verviers in the early morning, having followed a by-road through Julemont and Herve, Irene had to be awaked out of deep sleep. Yet the boom of the guns continued! Liège was still holding out, a paranoiac despot was frantic with wrath, and civilised Europe had yet another day to prepare for the caging of the beast which threatened its very existence.

(Continued on page 179.)

FOOD IN WAR-TIME.

By D. NOËL PATON, M.D., F.R.S., Regius Professor of Physiology, Glasgow University.

AT this time of stress and strain it is, I think, important that each of us should utilise our energy to the best advantage. In the present article the lesson I wish to emphasise is that all our power of doing work comes from the energy stored in our food.

The sun bounteously pours his energy upon the earth. The plants covering the earth take it and store it so that it is made available to us, either when we use these plants as food or when we feed upon the animals which have consumed the plants. From the food we eat we liberate the energy for work and for keeping ourselves warm.

Now I am not going to ask my readers to take this statement from me, to believe it because I say it. No scientific man will make a statement unless he is able to produce evidence which will satisfy his readers, or at least those of them who have had experience in estimating the value of evidence. I wish, therefore, at the risk of being wearisome, to put forward such evidence as will prove that *our food is the sole source of our power of doing work.*

The consideration of the case of a prolonged fast is quite convincing. Such fasts have been made many times by men for thirty or forty days, and carefully studied. Apparently, beyond some discomfort on the first day or two, no pain is experienced. Thus actual experiment has exploded that famous bogey the agonies of hunger. But during the fast the man loses weight, and he gradually becomes weaker and less able to do work. Give him proper food, and the loss of weight stops, his power of doing work returns. Nothing that we know of except proper food will act in this way. The material to repair his body and the power of doing work come from the food.

Now, if this is so, we must know how much energy the body requires in order to know how much food must be supplied. Physiologists have measured this in all conditions of life by keeping men in an airtight room so arranged that all the energy given off can be measured. This is done by finding the heat given off as heat energy, and by measuring the energy required for work by making the man ride a stationary bicycle working against a known resistance. The combustion of material in the body may also be measured with this apparatus. If the man is kept absolutely quiet in bed and without food, he uses energy at the rate of about sixteen hundred and eighty units per day of twenty-four hours. If he does a small amount of work, as in walking about—what a man leading a sedentary life may be expected to do—he uses two thousand five hundred units; and if he does a moderate day's muscular work, he uses three thousand

five hundred units. If he vigorously rides the bicycle he may use three times this amount. In fact, his energy expenditure is proportionate to the work he does; and this energy expenditure must be made good or he uses his own body and begins to lose weight.

This is well illustrated by Dr Dunlop's experience with convicts at Peterhead. He was consulted on account of the amount of waste which was going on. He examined the diet, and found that it contained three thousand nine hundred energy units. Estimating roughly the amount of work which had to be done, he cut down the diet to yield three thousand five hundred units. At once waste disappeared, but the men began to lose weight. He had manifestly given a diet with too little energy. A slice of bread per day was added to make up three thousand seven hundred units of energy, and the loss of weight disappeared and waste was not excessive. This clearly proves that the energy used for work must be supplied by the food.

I have been at some pains to prove this point, so that when fools or charlatans preach that the energy value of food is not of importance, is not the measure of its value, you may know that they are fools or charlatans. We Scots are credited with being a particularly 'canny' people; and we should have nothing to do with any suggested diet—by whatever body it is put forward—unless a definite statement is made of the energy it supplies and of the flesh-forming material—the proteins—it contains. This is done in the admirably constructed Dublin diets prepared under the supervision of Professor Thompson.

How do we measure the energy value of foods? It is done by finding the amount of heat each gives off in combustion. Now there are three great groups of foods: (1) the fats, (2) the sugars and starches, (3) the flesh-building foods—the proteins. Each of these yields a definite amount of energy in the body, and the diet must contain a sufficient quantity of them to provide the energy required. Any intake of food over this amount is simply wasted.

Obviously the diet must be adjusted to suit the conditions of life. One of these food-stuffs is absolutely essential. There must be enough of the flesh-forming material to repair the wear and tear of the body in the adult, and in the young to build up the body. There is good evidence that the supply of these flesh-formers should be largely in excess of what is absolutely necessary. Probably two ounces is sufficient, but four ounces is desirable. The proportion between fats and starch-foods is not so important. It is determined (1) by consideration of economy—the starches are cheaper than the fats—and

(2) by the fact that the power of digesting each is limited, so that it is better to take a proportion of each. It is thus possible to state definitely the amount of energy and of proteins which a diet will yield.

But, it may be asked, does an examination of the diets of people doing varying amounts of work show that the theoretical is the actual amount contained in their diets? An enormous series of such analyses of the diets of people of many different nations have now been made, and they show conclusively that, unless poverty prevents it, the energy intake does correspond to that calculated from scientific experiments, and that it is proportionate to the work done. Even among the very poor there is an attempt to reach these theoretical standards. Food is the first charge upon income. The energy must be provided; and, as the degree of poverty increases, the proportion of income available for other expenses becomes smaller and smaller. Miss Lindsay, in her *Dietary Studies of the Labouring Classes of Glasgow*, found that in families with a regular income of forty shillings, 55 per cent. of that income was expended upon food; but in families with an irregular income of under twenty shillings as much as 80 per cent. was thus expended. The amount of energy purchased was not very different—three thousand one hundred units in the former class, two thousand eight hundred in the latter.

Now we come to the question, *What is a good diet?* It is one which supplies the energy and the flesh-formers at the smallest possible cost. This is the economic definition; because the more cheaply energy—the power of doing work—can be got, the more economically work can be turned out. Coal and iron are so much inert material in the bowels of the earth until the energy of human labour is made to act upon them, and to convert them into the ships, the guns, the shells, and all the various machinery required for the prosecution of this war. Our power of financial endurance as a nation depends in no small measure upon this power of economically producing munitions—and this depends upon an adequate and cheap supply of food. It therefore behoves the Government to make provision to secure that such a supply of food is maintained, and that no such rise in prices is allowed to occur as will interfere with the liberal supply of energy to the workers. Of course, we ought all to be upon a ration, and to be fed according to the work we have to do. That alone would bring some people to their senses. Take this example from the *Times*. It is stated: 'The strike of the officials in Monmouth Poorhouse against the substitution of salt butter for fresh was prevented by the supply of fresh butter being continued!' At present no such prescient legislation as that which I have ventured to suggest is probable.

It has been found to pay to increase the food-supply in order to get a larger return of work. For example, an employer of labour, a brick-maker in Connecticut, found it profitable to keep his men in bothies, and to supply them with an amount of food sufficient to yield more than twice the usual supply of energy. These men, of course, were not trades unionists; their output of work was not arbitrarily regulated by the decrees of their officials.

But it must not be concluded that we can pour an unlimited supply of energy as food into the workers. Unfortunately the digestive organs can deal only with a certain quantity, and, in our urban population especially, the state of the teeth and the condition of the stomach greatly limit the working power by limiting the capacity to make use of the energy in food. Any food consumed above the amount which can be digested is simply wasted.

The economic definition of a good diet given above is insufficient in itself, for other considerations present themselves. (1) The food must be capable of easy digestion and utilisation in the body; it must be available; many vegetable foods without careful preparation and cooking cannot be used in the body. (2) It must be palatable, for it has been shown that the digestibility of food depends largely upon its being pleasing to the taste. (3) It must not be too bulky. Many foods contain a great amount of inert material or of water; for example, buttermilk is so dilute that forty glasses a day would have to be drunk to get three thousand energy units. Other foods take up such large quantities of water in cooking that they become bulky. For instance, in making porridge oatmeal increases greatly in volume, and three ounces make a very large plateful. (4) It must not be poisonous, either altogether poisonous or poisonous to the individual, as is sometimes the case with cheese or even with eggs. Alcohol in large amounts is poisonous to all.

This leads me to say a word about alcohol. Is it a food? To a small extent it is. Each one of us can utilise a limited amount—say two ounces—as a source of energy. But the amount we can thus use varies in the same individual at different times, and all the alcohol we take above this small amount poisons our tissues. It is because of its poisonous action on our higher nerve-centres that we take it. It cheers by abolishing that critical faculty the exaggerated development of which in the Scot makes for the self-suppression which can be removed by an adequate dose of alcohol. For the small amount of energy we can get in alcohol we pay an exorbitant price. Energy in whisky costs at least twelve times as much as it costs in bread.

There is another aspect to the question. In this country in the manufacture of alcoholic drinks no less than a million and three-quarter tons of cereal grains, of the most valuable of

our foods, is yearly converted into what can at best be termed a luxury. With this about eighty thousand tons of sugar are used, also an energy-yielding food of high value. This grain would be sufficient to supply the necessary energy and protein for about three million men for a year. Is it wise to allow this manufacture to go on at this time? The people of the country alone can solve the question by following the example of the King. In this way only can the compensation question be solved in a manner eminently satisfactory to the nation, however unsatisfactory to the manufacturer.

We must now consider, *How do you find the value of a food?* To do this, (1) take the price per pound; (2) take the energy units—the calories—per pound, and divide by the price per pound in pence to get the value of energy purchased per penny; (3) calculate the amount of proteins per pound. To do this, take the percentage amount and divide by 0.22. To get the protein purchased per penny, divide by the cost per pound in pence. *Locke's Food Values* (Appleton, 1913) will be found useful for this purpose.

A food-stuff of high value as a source of energy should yield, at present prices, over four hundred units per penny. A food of value as a source of protein should yield over twenty grammes (about three-quarters of an ounce) per penny.

It is very interesting to compare the value of various common food-stuffs at present war-prices with their value in pre-war times. Thus the price of wheat-flour has greatly increased, while the price of potatoes in September 1915 was lower than in September 1913.* At that time

more energy could be got by the expenditure of a penny on potatoes than on wheat-flour; whereas in pre-war times more could be got from wheat-flour. Even at war-prices, the return of energy and of protein in oatmeal per penny spent remains very high.

In conclusion, we have got to recognise that we buy food not to please our palates, not to fill our bellies, but *to get the power of doing work*. At the present time we must use all our forces, we must use all our energy, if we are to win this war. Food is the ultimate source of our energy. Let us, therefore, do all that is in our power to conserve our food-supply, and to use it with knowledge, intelligence, and discrimination. 'Good intentions pave the way to hell,' and good intentions as to using food economically and avoiding all waste will not enable us to secure a diet rich in energy at a small cost. We must first get knowledge of the values of foods, and we must take the trouble to apply that knowledge to the purchase and preparation of food. It means a lot of trouble. But are we who stay at home in comfort, protected by the brave men who have gone from us to guard our safety, and who are suffering hardship and danger for our sakes—are we going to spare ourselves this trouble when it means the provision of the very sinews of war without which all their efforts, all their sacrifices, must be in vain? If we will not give ourselves this trouble, if we are not prepared to make our little sacrifices, are we worth fighting for?

If we grasp the real significance of our food-supply, if we understand why it must be utilised to the utmost, surely we must be willing to take any amount of trouble to conserve and make more available this supply.

THE BOAR'S FOOT.

CHAPTER II.

IN the afternoon he was rewarded for a morning of patience and of research in the less-frequented cafés. In front of an unpretentious hostel overlooking the sea, and on the Condamine side, he found his prey—having beer, to be sure, but, thank Heaven! alone.

Like a flash of lightning, a brilliant scheme, a perfect scheme—oh! but a scheme in a thousand—entered the Frenchman's head. 'Bah!' he muttered. 'To know him is to know all, and that is well worth an old camera and some clouded plates.' And he went back to his hotel.

A quarter of an hour later he reappeared, bearing a camera—a large one—strung round him most insecurely by a string. This string was cut through in one part to all but a thread, and

this cut part he held firmly between finger and thumb. He approached the café, and made his way to a table at the back. As he came close to the table occupied by his quarry he stopped a moment. 'Garçon,' he called, 'a bock.'

He let loose the string.

Plak!

Down came the camera, first on to the marble-topped table, and then smack on to the pavement. The glass shutter was broken in a thousand pieces. Also, the beautiful golden bock in front of the customer was upset, the glass smashed into fragments, and foam and beer and broken crystal made a mess on the marble.

'Pardon, monsieur! a thousand pardons! I offer you my sincere apologies for an unpardonable carelessness. I'—

'Not at all, not at all; it is of no consequence.'

* The price of potatoes has risen since September from about 5d. to about 8d. per stone.

Achille still stood bowing and apologising, but with a grace and dignity that astonished even himself.

'Pray accept my excuses,' he begged with an unrivalled blend of grief and friendliness. — '*Garçon*, another bock.'

'Oh, that's all right,' said Donald pleasantly; 'but I am afraid your camera is done for, and the plates inside too.'

'Ah! *mes plaques, mes plaques!*' cried Achille, lying with inspiration. 'And two of them were of Sir Donald Carnegie, a friend of mine. What misfortune! But I can easily take him again. It does not matter *vairly* much.' And slowly, very slowly, so as to let the last sentences percolate to the brain of his hearer, he began to open the camera and take out the plates. He laid one down on the little table. Then with his left leg he skilfully hooked forward one of the café chairs and sat down on it, still very busy with the camera and bending over the plates.

He purred within himself at the success of his trap.

And now a bright thought came to the young man who sat opposite him. What a rum thing that this very man should tumble up against him! The very man he wanted to know! He remembered having seen him yesterday, and also that afternoon, and he recollected with whom he was. What a bit of luck!

'All the plates smashed?' he inquired.

'No, monsieur. Two are safe. But, alas! it does not *vairly* much matter; they were all failures. And I who hoped so much, so much, to have a little *souvenir* of my friend!' And Achille sighed and stared at the broken glass.

'Did you say they were of—of Sir Donald Carnegie?'

The tone of indifference was not lost on Achille. He knew that with a Briton it often represents interest.

'*Mais oui*,' he said absently, 'Sir Donald Carnegie. You may have met him in Scotland; it seems to be a small country, where every one is cousin to every one else, and very proud of it. We stay at the same hotel. A charming man, ah, certainly!'

'I used to know him,' said the other in an even voice; 'but I've not seen him for some time. Know him well?'

Now when Achille had been asked this by the American woman he had hedged. He did not hedge now. He lied.

'Oh, *vairly* well.'

A pause.

Achille drank his bock.

'It is a curious sing that Sir Donald must know *vairly* many more English here than I know French, yet we go about together; though last year the place was brighter than this,' he added inconsequently. 'Monsieur is staying here?'

Donald seemed to wake up. 'Yes; that is, for a few days. I am yachting with some people, and something has gone wrong with the propeller. So I came here to have a look at the tables, you know.'

'*Parfaitement*. And how beautiful it is, monsieur! Look at that lovely bay, and the sun, and the colour.'

And indeed it was lovely. Long, level lines of grays and blues lay on the water, ribbons of lavender, bands of pearl. The great glare of the day was gone. A soft light fell on the buff-coloured houses all along the bay and on the grayish-greenish road toward Cap St Martin. The sky was calm and transparent as the sky of an early Italian picture. There was a clarity and a repose in the gentle evening air.

'Yes, to sink,' pursued Achille, 'of all zose who come here and look not at the beauties of nature, but at the green fields of the gaming-table. Sir Donald, he rarely plays. He collects coins.'

'I believe he does,' said Donald; 'especially French ones—Provençals, that is. He has, or had, a very valuable one from Nîmes.'

'Ah, you know something about coins, then?'

'No, no; nothing. But what made me think of it was that, funnily enough, I bought a fake, a forgery, of one of these coins to-day.'

'Ah! how interesting! How do you know it is a forgery—a fake you call it?'

'The man told me,' said Donald, fumbling for it. 'He sold it to me as an imitation, and I rather like the thing, so I got it. My'— He stopped suddenly.

Achille looked at the coin, and as he did so a great and illuminating thought flashed over him. '*Poudre de Perlimpimpin!*' he murmured; 'it is thou who art a genius, Achille Gaston Beaulande, descendant of Clovis!'

'Will you permit me to see it?' And he took the coin between his finger and thumb. He turned it round; he peered at it; he screwed his eyes up and his mouth down.

'Dear sir,' he began slowly and impressively, 'this is no imitation. It is *genuine*.'

'Genuine! It can't be. I got it from Gobert at the corner of the square, and he knows all about them. He sold it as a reproduction. He would know, because there are only seven in the world.'

'Then monsieur does know about them?'

'Oh, no. I rather liked the thing, you know.'

'I have something to propose,' began Achille, and he looked solemn and impressive. 'My suggestion is *zis*. We were speaking just now of Sir Donald Carnegie. As you know, he is an authority on these matters. I do not know *vairly* much, but I am perfectly sure, nevertheless, that this is genuine. Now, if you will have the great kindness to allow me to have it for a few hours, I will take it to him and get his advice on it. You would abide by that, I think, and conseeder it conclusive?'

'Yes.'

'*Voilà!* Let it be so. Without doubt, I say, the thing is genuine—without doubt. I am a friend of Sir Donald; but of course I present you as well with my card;' and he whipped out a largish visiting-card.

Now, seeing this card, Donald knew he was bound to produce his own. That he did not wish to do.

'Not at all—not at all,' he said uncomfortably, and refraining from looking at the pasteboard.

'*Mais, monsieur, I pass my carte. I am an apple-grower from Picardy.*'

It was the most crafty thing Achille could have said. He thus obliged the other man to do what he did not wish to do. And his companion's card was passed to him. It was inscribed, 'Mr Donald Carnegie.'

'You see it is the same name,' said the young man, trying to smile, and making a mull of it. 'As you said just now, Scotland is a small place, and most people are cousins.'

'Ah, vary interesting! Then you also are cousins?' asked Achille blandly.

'No,' with an effort; 'but we are connected.'

'Connected! It is such an amusing word, it always makes me laugh. But regard. The light fades on the bay, the blue turns itself to mauve, and the gold to brown. It becomes cold, and I must re-enter before the damp and the cheel on the liver. I take the precious coin, and I give you *rendezvous* for here, to-morrow morning, at eleven o'clock. Is that to you pleasure?'

'Certainly; anything you like,' said Donald, rising, and looking more than ever like the old man. 'It's really very good of you to take all that trouble.'

'Ah, I beg of you! To-morrow at eleven, then. *Au plaisir!*' And with a beautiful bow Achille went off, delighted at having so successfully landed his fish.

His fish meanwhile walked to the edge of the little parade and stared at the sea. 'Oh, damn it all!' he said impatiently, and walked along to the tramway to Ville Franche.

Achille, sauntering home, reflected on his adventure. Not a cousin. A nephew, perhaps; but far more likely a son. The son—the only son. The name was the same, then—both baptismal and surname. Even though Scotland was a small country, populated chiefly by cousins, certainly there were some fathers and sons among the cousins. And what, after all, had that young man done?

After dinner he asked to see the precious coin.

'You promised, monsieur, to show me that crocodile coin one day,' he began. 'It would bore you, would it, to show it me to-night?'

'Not at all—not at all; come along to my room,' said Sir Donald.

And, once in his room, Achille realised what a passion it was to the old man. He had a case with him where a few bronze coins lay embedded

in little sunk holes covered in velvet, and velvet pads over them that lifted up. How reverently Sir Donald lifted the pads by their ribbon and disclosed the treasures below! How gently he treated them! How affectionately he eyed them!

'Extraordinary!' cried Achille.

'And this,' said Sir Donald, 'is my greatest treasure of all. I would not lose it for—well, I don't know what you could offer me for it.' As he spoke he lifted with the utmost care a little pocket of velvet, and passed it across.

'Ah! The Foot of the Boar, as you say! Permit me to take it to the light.' And Achille, holding as well the spurious coin in his hand, went nearer the electric light. For one second his back was toward his host. In that second he had exchanged one coin for the other. The reproduction now lay in the velvet bed, and the face with the crocodile was downward.

'Sank you—sank you vary much. It is beautiful; it is perfect. A real treasure.'

Sir Donald gave one look at his prize, and locked it up.

True to his appointment, at eleven o'clock the next day Achille was at the little café overlooking the sea; and he had not long to wait before his new friend turned up. He came along, a tall figure in white—white flannels, white socks and shoes—and a sun-browned face and sea-coloured eyes; and in his eyes such a pleasant, frank smile that Achille's heart went out to him again. Here was something better than all the crocodile coins in the world.

'*Bon jour! bon jour!*' he cried. 'You are to the moment, and I have news, but the best of news, to tell you. Regard the coin.' And he pulled it out, and handed it over with a bow. 'Regard, I say, for it is worth a fortune.'

'Really? Fancy the thing being real!'

'Come over to this trellis,' said Achille, 'where we can look at the sea and talk. But put that treasure into your pocket, and a safe one, I implore, without a hole in it. Listen, then. I did not ask Sir Donald, but I have the opinion of a man whom I can absolutely trust'—this was himself—'and he is perfectly certain zat it is genuine. He is a man in whose judgment I have implicit belief—far more so, indeed, than in Sir Donald, who is apt to mistake the real for the false, gold for pinchbeck, you understand.'

Donald nodded. They stood on the edge of the café, looking down at some gay little boats floating idly on the water. A green trellis half-covered with jasmine hid them from the street.

'*Mais oui,*' continued Achille, 'the thing is genuine. However, to make the matter absolutely certain, let us go, see you, to the little Gobert at the corner. He will tell you yourself, or his partner Schenck, who knows more than Gobert does.'

'Right-o! We'll go along. He'll be pretty sick,' said Donald; 'he sold it to me as a fake.'

'Then the fault is to him,' said the Frenchman. 'He cannot expect it back, the rabbit!'

'Tell you what,' said Donald. 'I'll meet you there in half-an-hour. I leave Monte Carlo to-morrow.'

'You leave to-morrow? Is it indiscreet to ask why you go?'

'I am tired of the place.'

'And also,' said Achille kindly, 'you do not wish to meet your father again.'

Donald suddenly stopped. They were walking along toward the casino under the trees, and now he stopped dead on the pavement. Then he went on again. 'You are right,' he said rather stiffly. 'How did you know? Did he tell you?'

'It is hot to-day. *Mon Dieu!* it is hot,' murmured Achille, and he stopped too, but by a bench under a tree, and subsided into it. He pulled out a handkerchief and wiped his face. 'My friend,' he said, 'you meet me yesterday, you leave me to-morrow. It is quite likely—is it not?—zat I shall never see you again. I know your father; I knew your mother. What harm, then, to tell me, who after all am only a shallow and superficial Frenchman—to tell me what went wrong about zat woman?'

Donald had looked annoyed at first; but now the look gave way to surprise. Nevertheless he sat down too.

'Then he did tell you?'

'He never told me a word. Zat, on my faith of a gentleman; he has told me nothing at all. I merely perceived it.'

'You are an extraordinary man.'

'Not at all—not at all. But listen. You may never see me again. For zat matter, you may never see your father again. Also, he is miserably unhappy.'

'He has got his coins.'

The young man spoke bitterly. Achille looked at him. Yes, there was something very far wrong, and he could not see his way clearly.

'Will you not tell me?' he asked again, and very kindly.

Now, if it had been an Englishman, or even one of his own countrymen, who had thus intruded on the young man's private affairs and inquired about them, he would have been given but scant information, though he might have been given a flea in his ear. But this Frenchman was different. He was grave and sensible, and yet full of the Gallic charm that melts even insular hearts. Donald gave way.

'There's not much to tell,' he said, 'and it's not the least good telling you. A year ago I wished to marry a certain lady, and became engaged. He refused to give his consent. So I told him I would marry without it. We had a bit of a row about it. Anyhow, I informed him I was going straight to marry her that week. So he said he would disinherit me, cut me off with a shilling, and all the things that you read off in books. Well, I went off, and was going to be married. Then I got the lawyer's letter saying I was cut off out of everything, money and houses and things like that, you know. And then, well—then the lady broke it off.'

'Ah!' said Achille. 'And then what did you do?'

'I wrote telling my father that it—that she—that it was off, don't you know, and I got no answer.'

'And what did you do then?'

'I went round the world.'

'He cannot have got your letter. Even if he hadn't, I do not understand it, for people must have told him that you were not married to the lady.'

'He forbade any one to mention my name,' said Donald lucidly. 'I told you we had a row.'

Achille nodded his head two or three times. 'Let us go on.'

(Continued on page 184.)

A H W A Z.

By J. NIVEN.

AHWAZ is a small town in southern Persia, which for many years has been used by the Euphrates and Tigris Steam Navigation Company as a forwarding station. Manufactures from Europe, India, and the Far East, silk wares and embroideries from Damascus and Aleppo, dates and oranges from Baghdad and Basreh, are transhipped here into a small stern-wheel steamer, or loaded on mule or camel caravans to be carried through ancient canals or over desert plains and mountain passes to the towns of central Persia. Eight years ago it gained an added importance when it became the base of supplies for the Anglo-Persian Oil Company, whose oilfields lie among the hills to the north-

east. The pipe-line which runs from the oilfields to the shores of the Persian Gulf passes near, and this probably explains the recent fighting which took place in the neighbourhood between British and Turkish troops.

To reach Ahwaz, the traveller, who has come down the Tigris from Baghdad or Basreh, or up the Persian Gulf from India or Europe, must tranship at Mohammerah. Mohammerah is situated at the junction of the Karun and Shat-el-Arab rivers, and here the light-draught steamer which sails once a fortnight for Ahwaz lies at her moorings. At this point the river is full of cross-currents, which form whirlpools strong enough to whirl a large dhow (or sailing-boat)

round and round in their eddies. On the right bank of the river stands a country-house belonging to the sheikh of Mohammerah, one of the wealthiest and most powerful men in the district. He is a very strong man in every sense of the word, and rules the Arab tribes with a rod of iron. Being on the frontier line which divides Turkish Arabia from Persia, this district is the dumping-ground for all those who have run counter to law and have managed to evade justice, and it is fortunate that its ruler has a strong hand with which to keep them in check. It is fortunate, too, that his sympathies are with the British, and that he does all he can to help them. Extensive date-gardens, orchards, and vineries surround the house, and almost hide it from view. The Karun, unlike the muddy and turbulent Tigris, has water of a clear and limpid blue, which is very good for drinking purposes, so that the British gunboats, when stationed at Fao or Bushire, often run up here to renew their water-supply.

The journey from Mohammerah to Ahwaz takes about two days. For some time before the steamer starts the scene on the bank and on board is one of noise and confusion. A barge lies alongside, and the great bales of cargo are rolled over a plank on to its iron deck; the coolies shout and sing a sort of rhythmic chant as they push the huge bundles to their places on the heaps which are piled high on both barge and steamer. Crowds of children chatter and jostle as they hurry to the river's edge. The deck passengers begin to arrive, sitting sideways on mules or horses; or they trudge steadily along through the dust, carrying their goods on their heads or on their shoulders. All have long rolls of bedding tied up in their prayer-rugs. Some carry bundles of various shapes and sizes wrapped in calico or packed into saddle-bags; others shoulder cheap tin trunks; others, again, carry long strings of cooking utensils and charcoal braziers and tripods. They themselves are of many nationalities—Jews and Greeks, Turks and Armenians, Talkedis and Beluchis. They wear many varieties of dress, from the Arab cloak to the European suit; but the long kilted frock-coat and brimless felt hat of the lowlander, and the tunic-blouse and astrakhan cap of the Bakhtiaris, or Persian highlanders, predominate. Here and there one sees a Persian lady and her maid; but she is so ensnathed in cloaks and veil that nothing but the eyes is visible. She hurries at once to her cabin, from which she will not emerge until the journey is at an end. A manservant will cook her food, and bring it to the door of the cabin, where the maid will receive it and give it to her mistress. Persian women of less wealth and dignity are to be seen among the deck passengers; but they too are draped in black from top to toe, and keep themselves muffled up, face and all, no matter how great the heat may be. Among the men, the Persians are

easily distinguished from the other Eastern races. They are slender and of medium height, with classic features which recall the profiles on some of the ancient Greek coins. They are crafty, vain, and untrustworthy. A Persian seldom makes a good servant. Unlike the Indian—who will as a matter of business cheat his sahib, but will at the same time whole-heartedly protect his employer's interests from the cupidity of others—the Persian is not above both cheating and helping others to cheat his master. He refuses to learn, being convinced that he already knows more than any Britisher can teach him, and he looks upon all Feringhees as his legitimate prey. He has neither the easy good-nature and keen sense of humour which characterise the Arab, nor the deep devotion and faithfulness which mark the finer type of Indian.

Late in the afternoon the last package is rolled on board, the gangway is removed, and the steamer gets under way. As she begins to move, the myriad noises gradually die away; the gaping villagers disperse, the shouting coolies are left behind, the deck passengers settle down in their respective corners, and nothing is heard save the wash of the waves and the croaking of countless frogs in the date-gardens.

There is not much variety of scenery for the next two days. The journey lies all the way between level banks, with the desert land stretching far into the distance on either side. There is no vegetation save the gray-green prickly stems of the camel-thorn, which clothes the land. Here and there we pass some Arab encampments, where the square black camel-hair tents of the Bedouins are grouped closely together; now and then we sail along between little villages of reed huts and mud-brick houses; but no event marks the idle passage of time as we glide on into the brilliant hues of the golden sunset, or wake once more to meet the radiance of the pearly dawn. The air is so clear and pure that objects which are miles distant are quite clearly seen by the naked eye; the brilliant blue of the sky is mirrored in the limpid waters of the river; the silence of the desert is unbroken save by the onward rush of the steamer or the voices of the boatmen, who take soundings every now and again to find where the bed of the stream is deepest. For part of the way the character of the land changes, the dry yellow soil of the desert giving place to long stretches of reed-grown marshes. The boat is then invaded by countless insects, of infinite variety as regards colour, size, and shape. But this marshland is soon left behind, and the whole world seems wrapped in peace. No better rest-cure could be found for the fagged and nerve-racked city worker than these days of quiet, rhythmic motion on the bosom of the softly flowing stream.

As we near Ahwaz the river has to be carefully navigated, as it is choked with the remains of ancient buildings, and stones lie in heaps in

the very midst of the channel. The water now flows over the site of an ancient town, whose buildings must have been of stone, a rare thing in the modern towns of southern Persia, where the houses are built of native-made or sun-dried bricks. Gradually the outlying villages are passed, and the steamer comes slowly to anchor at the river's edge.

Just above the landing-stage stands the house of the steamship company's agents. It is a long, low building, whose verandas are upheld by massive stone pillars, built of the stone which must have formed part of some ancient town long buried under the desert sands. A garden with olive, orange, and palm trees, and a few bright-coloured flowers, affords a pleasant rest to the eye.

As the steamer draws alongside, the whole town seems to wake from torpor, and to become instinct with life and excitement. Pariah dogs begin to yelp and bark; men appear from narrow lanes and hurry down to the landing-stage; men on horse or mule back arrive from the outlying villages, and ride at a gallop to the very edge of the water. The sun beats down on the yellow soil of the desert, on the gray-green of the camel-thorn which fringes its paths, on the long blue tunics of the Talkefi sailors, on the golden sashes and turbans of the Persians, on the brown or fawn-coloured or sombre black cloaks of the Arabs, making of each a vivid splash of colour against the drabness of the mud-brick houses. At the time of our visit oil had not yet been found in southern Persia, and Ahwaz still consisted of but a few scattered houses built on the banks of the river, and the town stopped abruptly on the edge of the desert. There were only three European residents—the British consul, the Russian consular agent, and the agent of the Euphrates and Tigris Steam Navigation Company.

All around on the desert are to be found traces of ancient cities and ancient civilisations. Cylindrical seals, with the name of their possessor in Arabic or cuneiform lettering; shards of pottery, whose vivid blues, greens, and purples have withstood the tropical sun for countless generations, and whose brilliant glaze still bears witness to the art of the potter; or some graceful vessel in a state of perfect preservation, all bear testimony to the artistic powers of the ancient Persians.

The climate is very dry and healthy, malaria is practically unknown, outdoor sports can be enjoyed in the winter or in the early morning during the hot weather, and the wide desert spaces offer an ideal opportunity to the lover of riding. To live in Ahwaz is to live on the desert itself, but a desert made less desolate by the patches of green which mark the spot where a few waving trees shade a human habitation, a desert where the springing ears of corn bear witness to the presence and

labour of man, a desert whose vast silence is broken by the soft wash of the waves and the unceasing murmur of the rapids, a desert whose endless monotony is relieved by a line of low foothills and the misty glimpse of the far-off mountains which are the highland fastnesses of southern Persia. To sit on the housetops at night is to realise the immensity of space, the infinity of starry worlds, the eternal calm of life's greatest things. It is as if one were really on the roof of the world, and as if all this restless human life of ours marked but a moment in the great eternities. The sense of the vastness of things becomes so overwhelming that it is a relief when the tinkle of mule-bells announcing an incoming caravan brings us back to the everyday activities and comfortable realities of life. And yet in the moonlight a mystery enshrouds even these. The long line of softly stepping camels and slowly striding mules, the picturesque figures of the drivers as they march alongside in their kilted tunics and brimless hats, the raucous cries of the muleteers, and the answering groans of the camels, all seem to convey a sense of unreality, seem to be dream-figures in some half-forgotten fairy tale, phantoms belonging to the silent empty spaces, which may vanish with the morning light. With the new dawn they seem more comprehensible and real; and as the sun rises, and the whole community wakes from sleep, the quiet square is turned into a scene of bustle and activity. The men run to and fro, shouting and gesticulating; the camels rouse themselves with many groans and grunts, and stand with swaying necks and open mouths to receive their breakfast. This consists of huge balls of barley mixed into a paste, which are thrust down the gaping throats as each animal comes forward to receive its share. The older beasts seem to like this food, and even try to deceive their drivers into giving them a double portion; but the younger camels scream and struggle as the ball of barley is forced down their unwilling throats. It is extraordinary how obedient these animals are. One word seems to convey to them a command, which is instantly obeyed, and a long procession of them will line up on one side of the road at a given signal.

But the point of greatest interest in the neighbourhood is the low range of hills which lie somewhat to the east of the town. They contain the remains of old cave dwellings which have probably been inhabited at one time by outlawed or robber tribes. A picnic to the hills is hailed with joy by the Europeans; for it is a delight to climb once more, and to have a view from a height, after months spent on the level. The surrounding country lies spread out at our feet as we look from the window spaces of these ancient mountain caves—broad yellow plains with the silver

thread of the river gleaming in the sun, a few scattered houses, a mosque or two, a few trees, some fields of wheat, the 'strip of herbage strewn, which just divides the desert from the sown;' and, on the eastward side, the Bakhtiari Hills looming vaguely in the distance. It is all spread out at our feet like a living map.

Just above Ahwaz the river forms rapids which cannot be crossed by boat, so goods which have to be conveyed by water to Shuster and other towns are carried across a strip of land to a small stern-wheel steamer called the *Shushan*. A line of rails has been laid down on the desert, and the goods are carried in wagons drawn by mules and horses. The journey from Ahwaz to Shuster is one of the most interesting which the traveller can take in this land which is so largely made up of endless plains. We had looked forward to it for months, and started at the end of the hot season, when the shade temperature in the daytime was still considerably over one hundred degrees Fahrenheit, but when the nights had begun to grow cool, and sleeping in a cabin was again possible. On its previous journey the *Shushan* had been attacked by pirates, and part of the woodwork on deck had been shot away, so every one was prepared for possible hostilities on the part of the robber tribes. A band of Arab soldiers were encamped on the deck, and a number of mounted Cossacks rode alongside on the banks of the river; every man on board carried a knife or a pistol, and in our cabin was a stack of guns and a box of cartridges. In spite of all these warlike preparations, however, our journey was fated to be entirely peaceable and uneventful. At first we steamed along amid scenery very like that which we had left behind; but gradually the ground became hummocky and overgrown with short scrub; and galloping horsemen, as they appeared and disappeared among the hillocks, lent a picturesque touch to the scene. Our second day's sailing brought us to a part of the river where the banks rose sheer out of the water, and towered high above us. We were told that these were really the walls of one of the ancient canals which served to water the land and supply the cities in the Babylonian era. An adjoining canal which branches off at right angles to the main waterway leads to the site of the ancient city of Shushan, known now as Susa, where Daniel lived, and where Esther became queen in place of Vashti. A party of archaeologists are sent there each winter, and are financed by a French millionaire. They have built a regular fort out on the desert, to protect themselves from bands of marauding Arabs, and live there during the six cool months of the year. Their excavations have brought to light the palace of Ahasuerus, and they have found old vessels of gold and silver, valuable statuettes, and ancient writings.

As our journey proceeded we drew ever nearer to the hills, and as we wound round the different bends of the river they rose high above us in ever-varied aspects. It was a joy to us to be once more among rocks and mountains, and we feasted our eyes on every curve and peak, which stood out so clearly defined against the intense blue of the cloudless sky. Wild duck and partridge were plentiful here, and now and then a rarer bird, the great bustard, would hover on the wing, tempting the Arabs to shoot at it. Fortunately they never succeeded in bringing one down, to be left wounded and dying on the desolate shore.

On the third day after leaving Ahwaz we reached our mooring-place, and cast anchor at the river's edge, about half-an-hour's distance from the town of Shuster. The river-banks slope upward at this point; and as the steamer lies in the stream it affords a good target to any one shooting from the shore. Here it had been attacked on its last visit, and some anxiety was felt as night drew near. Our guards gathered round, however, and we were disturbed by nothing more dangerous than the arrival of a camel caravan, with its accompanying shouts and groans as the drivers unloaded and fed their beasts. Shuster is a typical south Persian town, with narrow lanes and high houses whose overhanging balconies almost touch each other as they jut outward toward the middle of the street. The soil is very dry, and *serdabs* (or cellars) have been dug out twenty or thirty feet below the houses, and to these the inhabitants retire during the hottest hours of the day. With a shade temperature of one hundred and twenty degrees Fahrenheit in the rooms overhead, these cellars are so cool that one wants extra wraps on first entering them. Such an abrupt change of temperature is by no means healthy, and gives rise to malaria and sun-fever.

Shuster is famous for the manufacture of a particular kind of rug; it is hand-woven, thin in texture, and has no pile. The colouring is very brilliant and the designs bold and startling; but they give an Oriental note to a room when used as curtains or covers for divans.

We lay only one night at Shuster, so the boatmen and coolies were kept busy till a very late hour unloading and then loading cargo. As twilight fell the intending passengers began to arrive, but most of them encamped on shore till morning. Carpets were unrolled, bedding laid out, and the charcoal lit in the braziers. The dull glow of the fires was reflected on the many-coloured turbans (golden or red or green), on the flowing cloaks of the Arabs, on the gleaming sashes of the Persians, on the sombre outlines of black-veiled women, on the kneeling figures of the devout Mohammedans as they said their evening prayers, and on the flashing eyes and sun-browned faces of many an Eastern pilgrim

on his way to bury his dead in the sacred cities of Keebela or Kasmain. Behind them loomed vaguely in the starlight the shadowy shapes of the camels, which had been brought to a halt at the river's edge, and had settled themselves for the night where they might have company and protection. Gradually a great stillness fell on all, broken only by the sharp bark of a wandering jackal or the melancholy cry of a prowling hyena, by the ripple of the river as it broke against its banks, by the restless movement of some wakeful traveller, or the uneasy groaning of a weary camel.

With the first streak of dawn we prepared to

start once more, and men and beasts alike were roused from slumber. Ashes were shaken out of the braziers, rugs and bedding rolled up and carried on board, the last heaps of cargo placed in position. The passengers took their places on deck, the camel caravans prepared to wander farther over the desert, the Cossacks came once more into view and set off at a mad gallop through the sand, and the paddle-wheel began to churn up the water. We had started on our journey back to Ahwaz, filled with a great regret that we had to turn our backs upon the hills, and leave behind us the undulating plains which seemed to break into waves at their base.

DUST-BIN PROBLEMS.

By D. M. FORD.

AN interesting record of the sanitary benefits which can be effected in our towns and villages by careful attention to the subject of domestic refuse is now available in the recently published *Return as to Scavenging in Urban Districts*, prepared by the Public Health Department of the Local Government Board.

The problem of scavenging, at first glance, may possibly appear revolting rather than attractive; yet no other subject is more intimately connected with public health, and incidentally with public savings. In London recently, where the collection of refuse is weekly or bi-weekly, a medical correspondent pointed out that the public must understand that if they insist upon a daily collection of their household refuse they will drive death and disease from their homes, they will save the lives of their young children, they will be rid to a great extent of the fly pest, and they will actually save money as well.

How many people, for instance, voluntarily familiarise themselves with the methods of storing refuse which obtain in their particular district, whether in fixed ashpits (always more or less objectionable on account of the difficulties of thoroughly cleansing and emptying them) or in movable receptacles? It would certainly seem as if the presence of ashpits in the near vicinity of dwelling-houses was productive of no very serious loss of equanimity to the inhabitants of this country, since the *Return* informs us that 54 per cent. of urban districts in England and Wales still adhere to this method of storing their refuse, with its invariable accompaniments of vermin and smells. Movable receptacles for house refuse are less open to complaint, since these permit the contents to be thrown directly into the removal cart, and, owing to limitations of size, exact frequent emptying. But how many householders realise that unless *suitable* receptacles are provided, the same calamities which hover about the fixed ashpit will inevitably haunt the pathway of the insanitary bin? Section 157

of the Public Health Act (1875) enjoins that all movable receptacles used for storing refuse shall be 'constructed of galvanised iron, or other suitable impervious material of a sufficient strength and thickness, provided with suitable handles and a properly fitting rainproof cover, and of a capacity not exceeding two and a half cubic feet;' yet the facility with which the consciences of the community evade this particular decree is accurately determined by the *Return*, which states that only 11 per cent. of urban districts in this country are provided with sanitary dust-bins, the remainder, after ashpits have been disposed of, possessing only miscellaneous receptacles.

The type of removal cart, again, bears the very closest relationship to the public health; yet what degree of scrutiny does the average citizen bestow on the nature of the local tumbril as it jogs relentlessly past his door? In Vienna the domestic refuse from its two million or more inhabitants is collected by carts provided with special receptacles. All the dust-bins are covered square boxes of a uniform shape and size. These boxes are pushed into the receptacle of the cart, which is then closed by a lid, and the box is uncovered and emptied by turning a handle without any dust escaping into the street. The example of the Austrian capital is doubtless a counsel of perfection so far as this country is concerned; but one would naturally assume that no community could possibly exist which did not enforce the provision of at least *covered* vehicles for the removal of house refuse, and these of a sufficient size and number to prevent overloading of the contents. Reference to the *Return*, however, assures us that we are not altogether correct in our surmise. Covered removal carts, it appears, are in use in only 63 per cent. of the urban districts of England and Wales, the remainder of the inhabitants being guilty of still adhering to the abhorred open vehicles. The writer of this article cherishes a vivid recollection of this latter type of removal cart in an ancient cathedral city.

Eagerly shadowed by a ragged horde on the *qui vive* for 'droppings,' heaped to the skies with all manner of offensive items exhaling poisonous effluvia down every street, the winds of heaven wantoning amidst the garbage, and scattering impartially to all points of the compass dust, rags, feathers, and one's most intimate scraps of correspondence, thus this prehistoric equipage pursued its appointed route, the shadow of the venerable pile overhead imparting a touch of forlorn dignity amongst the dismal surroundings.

The utilisation of domestic refuse is probably a subject which attracts even less general attention than either its removal or storage. Yet to the utilitarian type of mind (and who is not an economist nowadays?) this problem is intimately connected not only with interest but with ingenuity. The remunerative disposal of house refuse, unfortunately, involves sorting, one of the most degrading and worst-paid trades, which, however, could speedily be robbed of its most objectionable features if householders would undertake to perform part of the process themselves. Mr J. A. Priestley, Sheffield's cleansing superintendent, is very emphatic on this point. He says: 'The sorting of refuse as at present carried out in many districts in London is very objectionable on sanitary grounds, but with present methods I do not see how any sorting process other than by hand is feasible. My own view is that the sorting ought to be rendered unnecessary by a separation of the usable and unusable classes of refuse at each house, with a separate receptacle for each class. By this means, refuse which had any value would not be contaminated by refuse requiring destruction, and the sorting out into different classes would be robbed of its present objectionable features.'

We are informed by the Return that the remunerative value of house refuse varies with its nature and degree. It is generally assumed that where fish and animal offal abounds in sufficient quantity it is a paying proposition to put down plant for its conversion into artificial manure. Waste-paper, too often consigned to the flames, is another marketable item, being easily pressed into bales which the papermaker can work up again into a useful commodity. The value of tin-plate, however, has considerably decreased of late years. At one time it appears to have been worth eleven shillings a ton, and down to as late as 1911 Northampton's annual profits on tin-plate and solder alone amounted to nearly eight hundred pounds. The present decreased value of tin-plate is owing in great measure to the small amount of solder now used in its general composition, and there is a general consensus of opinion that only a combined solder recovery and detinning process will ever make this commodity really profitable again. Galvanised and enamelled scrap metal is recognised as commanding a ready market anywhere, whilst bottle glass fetches from ten

shillings to twelve-and-six a ton. Even ashes, clinker, and flue dust may be used up in the making of mortar, concrete flags, and disinfectant powder. The filter-beds at sewage-works dispose of some of these residuals, whilst various attempts at brickmaking are responsible for the rest.

Destructors play an important part in the utilisation of dust-bin contents; but these, unfortunately, are only possible in rich and populous districts. When fitted with boilers for generating steam, destructors can also be used to make electricity, or to pump sewage, or for other machinery. The profits realised from the various by-products of the destructor reach quite fabulous sums in many of our large cities. Manchester's receipts in twelve months from old iron and tins have amounted before now to over one thousand pounds, the sale of waste-paper has brought in one hundred and eighty-three pounds, and twenty-three pounds has been gained by the utilisation of clinker. In Glasgow, where a process is in operation to make artificial manure out of fish and slaughter-house offal, the profits in 1914 from this source of revenue amounted to close upon eleven thousand pounds. At the destructor stations of this same city waste metal is automatically separated from clinker, and sold for nearly thirty shillings per ton. In Liverpool some three hundred yards of flags are made every day for use in the various streets from clinker refuse.

Districts not possessing a destructor (and these are all too many, according to the Return) dispose of their house refuse in various limited ways. Towns on the seacoast or tidal rivers frequently barge their refuse out to sea. In the country, farmers and market gardeners often receive a large proportion of the available house refuse from the towns, and use it for manure. Sometimes the contents of dust-bins are used to fill up marshes and excavations; but in far too many districts the refuse is merely 'tipped' at places sufficiently remote from human habitation. Yet even a 'tip' has its mission in life, for at the end of three years the material of which it is composed becomes completely disintegrated, when it forms valuable manure for heavy soils, or can be used in brick-burning.

MOTHER OF SONS.

YOUR hands are tired with their long day's labour—
Toil-worn hands that have worked with a will;
Will they know no rest till they lie for ever
In that firm clasp, so white and so still?

Your dark-rimmed eyes are dimmed with weeping,
Their heavy lids are fain to close;
Must they see more sorrow ere the last mist rising
Heralds the hour of the long repose?

Though dusk has filled the valley hollows,
The thick dews fallen, the wind grown cold,
In the west there glows the rose of promise,
With flaming petals and heart of gold!

Chambers's Journal

SEVENTH SERIES

ROUMANIAN CUSTOMS AND SUPERSTITIONS.

By G. BASIL BARHAM.

IT is impossible to travel through Roumania without arriving at the conclusion that the average Roumanian must be the most superstitious person on earth. Before he is born his mother is hemmed round with all manner of conventions. She may not do this, she may not do that; she may not even steal lest the image of the stolen object should appear on the face of the child. When the time comes for him to make his appearance no one must hear of it, or the birth will be painful. Should, however, another woman hear the news, the correct thing to do is for her to come and present the invalid that is to be with some shreds torn from her clothing. These shreds should then be burned without loss of time.

The newly born Roumanian must be bathed immediately in hot water in which a white goose has been dipped. This is a wise precaution, as it renders the child immune against witchcraft. But, after being bathed, on no account must the child be allowed to sleep before a small pellet of wood ashes mixed with saliva is pressed on his forehead to ward off the evil eye. In certain localities, near the Pindos, the Armini people pickle the new arrival in salt for twelve hours; after which they wash his little body with water and wine.

The new baby's bath water is always poured carefully on the ground within the shadow of the house. The place where it is poured must be perfectly clean, or the fairies will get angry and curse the child with bad luck. It is interesting to note that for three weeks after the birth both the mother and the infant must wear something of a red colour, even if it be only a scrap of ribbon. It is as well to continue this precaution, which is directed against the evil eye, until the child is a month or even six weeks old.

At the time of the first feeding the mother must have a sieve with a little crumbled bread in it held over her head. Further, if any friends or relations come to visit her before the child is a month old, she must not say a word to them on their departure, lest her milk go with them. She must not be left alone, nor may she see a light from another house, before the christening. A lamp, burning oil in preference to grease,

must be kept alight in her room for forty days after the accouchement.

On the evening of the day on which the child is three days old the house door must be locked, and every one must retire to rest at sundown. No one may leave his room or get up before sunrise on any account; nor must a light be shown in any other than the mother's room, for on that night the three Fate-bringers will visit the house, and finally decide as to the luck of the child. If they are disturbed in any way they may visit their displeasure upon the child; and I have been assured that a certain family who kept a dog even went to the length of shutting the animal out of doors the night their first-born was three days old, lest he should bite one of the fairies!

The child must not be left alone if it can be avoided, even for a moment, before the christening. Were it left unattended, either the Devil would warp its mind or change it for a pink fiend, or a wandering vampire would come and turn it into a vampire too. I may add here that the Roumanians of the Carpathians believe as firmly in the existence of vampires as they do in the existence of a hereafter. They *know* there are vampires. Of course, there are times when it might be absolutely necessary to leave the child unattended for a few moments, in which case a broom placed across the cradle, or, rather, trough—for a Roumanian cradle is little more—will keep the child from harm.

No one should step over a cradle that is occupied, as that would prevent the child from growing tall. No mother should kiss her child in the palm of its left hand, or it would grow up with a tendency toward dishonesty; to kiss it in the palm of the right hand would be to cause it to become an open thief. It is a most unwise thing for a mother to kiss her infant in the nape of its neck, as it would be almost certain to cause him to grow up a self-willed, disobedient fellow, who would ultimately go to the bad altogether.

One of the most curious superstitions that have come to my notice is that if a child is slow in learning to walk, if it seems nervous, or stumbles, or cries if it is stood on its feet, all that has to be done is for the mother to tie its little feet together with a piece of red thread,

string, or ribbon, carry it to the doorstep, lay it down, and then—using an axe if possible, but if not an axe, a hatchet—cut the thread, which will at the same time cut the child's fear away.

Baptism in Roumania is by complete immersion, and as soon as the child is baptised it is given Holy Communion. If it fails to cry during that ceremony it is proved to be a child of the Evil One, and is to be shunned through life. It is seldom that a child has to bear that stigma! Whichever one it may be of the infant's relations that is holding the child at the time usually sees to that by means of a discreetly given little pinch.

Neither the mother nor the father may attend this baptism, for some reason I am unable to arrive at. When the Holy Communion is administered holy oils are rubbed on the child; after which it must not be washed for a month. At the end of that time the holy oils are washed off in the presence of all the relations and friends of the child. Every one present is expected to drop a coin, as large as he can afford, into the bath, in order to ensure that the child shall become rich and prosperous. It may be mentioned that the Roumanian loses no opportunity for feasting if he can help it, and the washing away of the holy oils is a ceremony which is usually followed by an orgy of flesh-meats and cakes.

Should a mother lose all her children but one through sickness or accident, as soon as the last little victim is buried she will take the survivor, wrap it in a cloak, lay it on the doorstep of the village church, and turn away weeping bitterly. A friend is, however, conveniently at hand who picks up the child, and takes it back to the mother. But the mother refuses to consider it as hers, and will only consent to adopt it. This is supposed to break the trail of bad luck, as the evil influence which had compassed the death of the others will be deceived into believing that the surviving child is a foundling who has nothing to do with the family it has been persecuting.

It is of interest to note that St Andrew's Eve, Christmas Eve, New Year's Eve, and the Eve of Epiphany are evenings during which careful inquirers can read the future so far as love and fortune are concerned. If a sprig of sweet basil can be stolen from a priest, and left on the thatch all night, the one who placed it there will know in the morning whether he will have great good-luck or not, as, if he is to be fortunate, it will be covered with hoar-frost. The love-sick maid and swain can tell, on any of these evenings, whether they will be married that winter by merely placing a sprig of sweet basil near a stone in the garden. If it is frost-covered next morning they may order their wedding garments without the slightest fear that they may not be needed.

If, on any of these four evenings, a maid or wife desires to learn if her lover or husband is

true or not, two pig's bristles will tell her if she places them together on the hearth. If he be true they will curl and turn together, but if he be false they will twist apart. On these four evenings it is the custom for all the maids in the house to take an onion each, hollow it out, fill it with salt, and stand it on the window-sill. She whose onion in the morning contains most water will be married before the others.

One of the most potent love-charms is a sprig of a basil plant sown and grown in a particular way. If it can be placed in the clothing of a favourite young man or maid it will cause love to be reciprocated in a few hours. But it is not easy to grow the plant. It must be grown from seed carried to the garden in the mouth on St George's morning; the lips must numble a depression in the soil in which the seed may lie, and the lips must cover it with loose earth. Then the seed is to be watered every morning with water brought in the mouth, exactly at the time the sun is peeping over the horizon. If a few minutes too late, the charm will never act, and a new seed must be sown the following year.

A wedding takes three days as a minimum, and is hedged about with restrictions. The food must be prepared in a certain way and cooked in a particular manner, otherwise all sorts of unpleasant fates will await the young couple. All weddings begin on a Thursday, and are not completed by the Saturday, when the couple are brought together for the first time during the ceremony for the feast proper. The preliminary stages of the wedding take place at the houses of the parents of the bride and bridegroom; the latter part at the house the young people are going to occupy.

As soon as the guests arrive the bride has to throw cold water on them in a literal sense. This she does by means of a spoon, and each drop a guest receives means a blessing. Some guests make a practice of getting as close as possible to the fair sprinkler. As soon as the guests are all assembled feasting commences, and goes on all through the Saturday night and Sunday; and on Sunday the actual wedding takes place. The couple are first married by the mayor of the village; after which they go to the church for Holy Communion, returning home to the grand feast which concludes the wedding festivities, until the evening of the following day, when they are resumed and more feasting is indulged in. The duration of this depends on the good sense of all concerned and the amount of funds which can be got together.

Married life is not according to Western conventions, as it is firmly believed that if a man does not beat his wife he does not love her, and consequently a woman who did not receive an occasional thrashing would begin to seek about for evidence sufficient to justify her applying for a divorce.

On no account must a dying person be allowed to pass away in the dark. He must hold a candle or taper in his hand at the moment of dissolution, as the light keeps away evil spirits who would tamper with his soul, and in addition enables his spirit to find its way to heaven. When the dying man has breathed his last, the window must be opened instantly, or, failing that, one of the panes of glass or sheets of oiled paper, whichever are used, must be broken in order that the spirit may pass easily away. The body is then washed reverently in hot water, which is afterwards carefully poured at the foot of a tree; his nails are cut and the parings embedded in

wax and retained by the relations as keepsakes; and afterwards he is dressed in new linen, his best clothes, and a black lambskin hat. For three days candles are kept burning before the corpse; after which the coffin, uncovered, is taken to the churchyard. The reason for its being left uncovered is to enable the dead to take a last look at the world. In certain districts the authorities will not allow interments being made in that manner, and the difficulty is got over by putting little windows in the sides and lid of the coffin. After the funeral every one drinks to the future life of the departed, but before doing so is careful to spill a few drops of wine on the ground.

THE DAY OF WRATH.

CHAPTER IX.—*continued.*

THE leader of the convoy was greeted by a furious staff officer in such terms that Dalroy judged it expedient he and the others should slip away quietly. This they contrived to do. Maertz recommended an inn in a side-street, where they would be welcomed if accommodation were available. And it was. There were no troops billeted in Verviers. Every available man was being hurried to the front. Dalroy watched two infantry regiments passing while Maertz and Joos were securing rooms. Though the soldiers were sturdy fellows, and they could not have made an excessively long march, many of them limped badly, and only maintained their places in the ranks by force of an iron discipline. He was puzzled to account for their jaded aspect. An hour later, while lying awake in a fairly comfortable bed, and trying to frame some definite programme for the day which had already dawned, he solved the mystery. The soldiers were wearing new boots! Germany had everything ready for her millions. He learnt subsequently that when the German armies entered the field they were followed by ammunition trains carrying four thousand million rounds of small-arm cartridges alone!

He met Joos and Maertz at *déjeuner*, a rough but satisfying meal, and was faced by the disquieting fact that neither Madame Joos nor Irene could leave the bedroom which they shared with Léontine. Madame was done up; *cette course l'a excédé*, her husband put it; while mademoiselle's ankles were swollen and painful.

These misfortunes were, perhaps, a blessing in disguise. An enforced rest was better than no rest at all, and the constant vigil by night and day was telling even on the apple-cheeked Léontine.

Joos wanted to wander about the town and pick up news, but Dalroy dissuaded him. The woman who kept the little *auberge* was thoroughly trustworthy, and hardly another soul

in Verviers knew of their presence in the town. News they could do without, whereas recognition might be fatal.

Irene put in an appearance late in the day. She had borrowed a pair of slippers, and the landlady had promised to buy her a pair of strong boots. Sabots she would never wear again, she vowed. They might be comfortable and watertight when one was accustomed to them, but life was too strenuous in Belgium just then to permit of experiments in foot-gear.

When night fell Joos could not be kept in. It was understood that the *Kommandantur* had ordered all inhabitants to remain indoors after nine o'clock, so the old man had hardly an hour at his disposal for what he called a *petit tour*. But he was not long absent. He had encountered a friend, a curé whose church near Anbel had been blown to atoms by German artillery during a frontier fight on the Monday afternoon.

This gentleman, a venerable ecclesiastic, discovered Dalroy's nationality after five minutes' chat. He had in his possession a copy of a proclamation issued by Von Emmich. It began: 'I regret very much to find that German troops are compelled to cross the frontier of Belgium. They are constrained to do so by sheer necessity, the neutrality of Belgium having already been violated by French officers, who, in disguise, have passed through Belgian territory in an automobile in order to penetrate Germany.'

The curé, whose name was Garnier, laughed sarcastically at the childishness of the pretext put forward by the Commander-in-Chief of the Army of the Meuse. 'Was war waged for such a flimsy reason ever before in the history of the world?' he said. 'What fire-eaters these "disguised" French officers must have been! Imagine the hardihood of the braves who would "penetrate" mighty Germany in one automobile! This silly lie bears the date of 4th August, yet

my beloved church was then in ruins, and a large part of the village in flames!'

'Verviers seems to have escaped punishment. How do you account for it?' inquired Dalroy.

'It seems to be a deliberate policy on the part of the Germans to spare one town and destroy another. Both serve as examples, the one as typical of the excellent treatment meted out to those communities which welcome the invaders, the other as a warning of the fate attending resistance. Both instances are absolutely untrue. Every burgomaster in Belgium has issued notices calling on non-combatants to avoid hostile acts, and Verviers is exactly on a par with the other unfortified towns in this part of the country. The truth is, monsieur, that the Germans are furious because of the delay our gallant soldiers have imposed on them. It is bearing fruit, too. I hear that England has already landed an army at Ostend.'

Dalroy shook his head. 'I wish I might credit that,' he said sadly. 'I am a soldier, monsieur, and you may take it from me that such a feat is quite impossible in the time. We might send twenty or thirty thousand men by the end of this week, and another similar contingent by the end of next week. But months must elapse before we can put in the field an army big enough to make headway against the swarms of Germans I have seen with my own eyes.'

'Months!' gasped the curé. 'Then what will become of my unhappy country? Even to-day we are living on hope. Liège still holds out, and the people are saying, "The English are coming; all will be well!" A man was shot to-day in this very town for making that statement.'

'He must have been a fool to voice his views in the presence of German troops.'

The priest spread wide his hands in sorrowful gesture. 'You don't understand,' he said. 'Belgium is overrun with spies. It is positively dangerous to utter an opinion in any mixed company. One or two of the bystanders will certainly be in the pay of the enemy.'

As the curé was now on surer ground than when he spoke of a British army on Belgian soil, Dalroy egged him on to talk. 'My chief difficulty is to know how the money was raised to support all these agencies,' he said. 'Consider, monsieur. Germany maintains an enormous army. She has a fleet second only to that of Britain. She finances her traders and subsidises her merchant ships as no other nation does. How is it credible that she should also find means to keep up a secret service which must have cost millions sterling a year?'

'Yes, you are certainly English,' said the priest, with a sad smile. 'You don't begin to estimate the peculiarities of the German character. We Belgians, living, so to speak, within arm's-length of Germany, have long seen the danger, and feared it. Every German is taught that the

world is his for the taking. Every German is encouraged in the belief that the national virtue of organised effort is the one and only means of commanding success. Thus the State is everything, the individual nothing. But the State rewards the individual for services rendered. The German dotes on titles and decorations, and what easier way of earning both than to supply information deemed valuable by the various State departments? Plenty of wealthy Germans in Belgium paid their own spies, and used the knowledge so gained for their private ends as well as for the benefit of the State. During the past twenty years the whole German race has become a most efficient secret society, its members being banded together for their common good, and leagued against the rest of the world. The German never loses his nationality, no matter how long he may dwell in a foreign country. My own Church claims to be Catholic and universal, yet I would not trust a German colleague in any matter where the interests of his country were at stake. The Germans are a race apart, and believe themselves superior to all others. There was a time, in my youth, when Prussia was distinct from Saxony, or Württemberg, or Bavaria. That feeling is dead. The present Emperor has welded his people into one tremendous machine, partly by playing upon their vanity, partly by banging the German drum during his travels, but mainly by dangling before their eyes the reward that men have always found irresistible—the spoliation of other lands, the prospect of sudden enrichment. Every soldier marching past this house at the present moment hopes to rob Belgium and France. And now England is added to the enticing list of well-stocked properties that may be lawfully burgled. I am no prophet, monsieur. I am only an old man who has watched the upspringing of a new and terrible force in European politics. I may live an hour or ten years; but if God spares me for the latter period I shall see Germany either laid in the dust by an enraged world or dominating the earth by brutal conquest.'

But for the outbreak of the war Dalroy would have passed the 'interpreter' test in German some few weeks later. He had spent his 'language leave' in Berlin, and was necessarily familiar with German thought and literature. Often had he smiled at Teutonic boastfulness. Now the simple words of an aged village curé had given a far-reaching and sinister meaning to much that had seemed the mere froth of a vigorous race fermenting in successful trade.

'Do you believe that the German colony in England pursues the same methods?' he asked, and his heart sank as he recalled the wealth and social standing of the horde of Germans in the British Isles.

'Can the leopard change his spots?' quoted the other. 'A year ago one of my friends, a maker of automobiles, thought I needed a holiday.

He took me to England. God has been good to Britain, monsieur! He has given you riches and power. But you are grown careless. I stayed in five big hotels, two in London and three in the provinces. They were all run by Germans. I made inquiries, thinking I might benefit some of my village lads; but the German managers would employ none save German waiters, German cooks, German reception clerks. Your hall porters were Germans. You never cared to reflect, I suppose, that hotels are the main arteries of a country's life. But the canker did not end there. Your mills and collieries were installing German plant under German supervisors. Your banks'—

The speaker paused dramatically.

'But our God is not a German God!' he cried, and his sunken eyes seemed to shoot fire. 'Last night, listening to the guns that were murdering Belgium, I asked myself, Why does Heaven permit this crime? And the answer came swiftly: German influences were poisoning the world. They had to be eradicated, or mankind would sink into the bottomless pit. So God has sent this war. Be of good heart. Remember the words of Saint Paul: "So also is the resurrection of the dead. It is sown in

corruption; it is raised in incorruption. It is sown in dishonour; it is raised in glory. It is sown in weakness; it is raised in power."'

The curé's voice had unconsciously attained the pulpit pitch. The clear, incisive accents reached other ears.

The landlady crept in, with a scared face. 'Monsieur!' she whispered, 'the doors are wide open. It is an order!'

Dalroy went rapidly into the street. No loiterer was visible. Not even a crowd of five persons might gather to watch the military pageant; it was *verboden*. And ever the dim shapes flitted by in the night—horse, foot, and artillery, automobiles, ambulance and transport wagons. There seemed no end to this flux of gray-green gnomes. The air was tremulous with the unceasing hammer-strokes of heavy guns on the anvil of Liège. Staid old Europe might be dissolving even then in a cloud of high-explosive gas.

The scheme of things was all awry. One Englishman gave up the riddle. He turned on his heel, and lit one of the cheap cigars purchased in Aix-la-Chapelle less than forty-eight hours before!

(Continued on page 197.)

THE V.C. OF THE MERCHANT SERVICE.

By WALTER T. ROBERTS.

THE medal bestowed by Lloyd's for acts of conspicuous bravery which have contributed directly to the saving of life at sea is as coveted a distinction in the mercantile marine as is the V.C. among naval and military men, for the medal is recognised by the seafaring community all over the world as the reward of the highest courage. It is, of course, bestowed entirely irrespective of rank, and also of nationality, but it is not lightly awarded. The strictest and most careful inquiries are made into each claim for a medal, and unless Lloyd's Committee are fully satisfied that the person on whose behalf claim is made has performed an act of the greatest bravery the medal is not awarded. Claims for the medal have, indeed, been frequently rejected, and it may safely be said that in every case where it has been awarded it has been won by some act of deathless heroism.

It is characteristic of the men who have won the distinction of a Lloyd's medal that they entertain a rooted dislike and prejudice against talking about the circumstances under which they gained it. Their deeds were not witnessed by any press correspondent, and in the majority of cases the story of these acts of selfless courage and daring are known only to comparatively few people. Hence it has been by no means an easy task to collect the details of how the medals have been won; but by the courtesy of

the secretary of Lloyd's the writer was allowed to investigate the correspondence which took place over certain claims, which has in some cases been preserved, and from these letters and documents the stories here narrated have been gleaned.

It is doubtful if the medal has ever been won by a greater hero than Captain W. J. Nutman, who commanded the steamship *Aidar* of Liverpool, which foundered in the Mediterranean, near Messina, on 19th January 1876. During the night the boiler of the luckless vessel burst, and ere morning it was seen that the ship was doomed. The night was bitterly cold; a gale was raging, and a huge sea running. Early in the morning the *Aidar* was sighted by the Bibby liner *Staffordshire*, whose captain at once decided to send a lifeboat to the sinking vessel. It was an immensely dangerous task that the crew of the lifeboat undertook; but after an hour of terrible toil and almost superhuman exertion twelve men were taken off the *Aidar*. Then a second boat was despatched, and eight men were rescued. There now remained on the foundering vessel only the captain and an injured fireman, whom the former declined to leave. It was impossible to get them both into the second boat, and Captain Nutman was confronted with the choice of taking what appeared to be the only possible chance of saving his life and leaving the fireman

to his fate, or of sharing that fate with him. Without an instant's hesitation he chose to remain with the fireman. He shouted to the officer of the *Staffordshire* who was in charge of the second boat to take the eight rescued men to his ship, and then return to look for him. 'You will have two more to rescue,' he cried, 'or none.' And so the hero waved farewell to the lifeboat, and calmly and cheerfully prepared to meet death with his fireman, who was too badly injured to make the least attempt to save his own life. Half-an-hour later, as the *Aidar* began to settle beneath the waves, Captain Nutman made a last desperate effort to save the fireman's life; he lifted the man in his arms and flung him into the seething water, and then plunged in after him, and managed to seize and drag him to an overturned boat of the foundered ship. For an hour the captain remained clinging to the keel of the boat with one hand, whilst he kept the man's head above water with the other; and then, just when the captain's strength was giving out, and he was making a last despairing effort to keep the fireman afloat, the boat of the *Staffordshire* arrived, and both were rescued. The story of Captain Nutman's heroism will live among seafaring men until it becomes legendary.

The story of how Chief-Officer A. M. Bruckland and Third Officer A. G. Tollemache of the steamship *Umona* won the medal is perhaps one of the most thrilling to be unearthed in the documents at Lloyd's. The *Umona* (owned by Messrs Ballard, King, & Co.) sailed from Colombo on a fine night in May in 1903 for Port Natal, having on board ten European passengers and four hundred and eighty Indian emigrants. All went well until the ship was nearing the dangerous coral-reef known as the Suadiva Atoll, in the Indian Ocean. The south-west monsoon was then rising, and the vessel was driven on the reef. Fortunately this occurred at two in the afternoon, not at night; and without very much difficulty all the passengers and emigrants were transferred from the ship to the island reef, which was about two hundred yards square. This was accomplished without loss of life, but they were nevertheless in an extremely dangerous plight. Picture their position. They were a party of over five hundred, gathered together on a bare coral-reef two hundred yards square, which might ere long be swept by the seas that were rising with the breaking of the south-west monsoon, and the reef was miles out of the track of ships. It was evident there was only one thing to be done—a boat must be sent to the nearest port to ask for help; but the nearest port was Colombo, a journey of five hundred and thirty miles, and the weather was becoming 'dirtier' every hour. Lloyd's would have wanted a big premium to insure the safe arrival of an open sailing-boat from that island reef to Colombo under such conditions. It was certainly fifty to

one the boat would be swamped; but if some one did not offer to take the risk of the voyage, it was practically a certainty that the whole party would perish. To Mr Tollemache and Mr Bruckland belong the honour and credit of volunteering to undertake the voyage. The captain at first hesitated about allowing them to set out on so hazardous a venture, but as there was plainly no other course by which the lives in his charge could be saved, he at last consented. Considerable difficulty arose, however, in getting volunteers for a crew; but at length two English passengers, two of the ship's crew, and a Lascar declared their willingness to share the perils of the voyage with the two intrepid officers, and so at 8 p.m. on the evening of the 16th of May the little boat with its seven occupants started out on its voyage across five hundred and thirty miles of ocean. For the next four days the crew were on the very brink of death. The weather steadily grew worse, and at the end of the second day the seas were running mountains high, and it seemed inevitable that before long the little cockle-shell of a boat struggling so desperately to keep afloat must be engulfed in those immense seas, and obliterated from the face of the waters. For four days and nights Tollemache and his companion ceaselessly toiled to keep the boat afloat. They took it in turn to bail and steer; for, as one false turn of the rudder meant instant destruction, they dared not trust any of the crew at the helm. All the others could do was to assist in bailing out the water; but soon some of them sickened with dysentery, and the others became too exhausted to render further help to the two men who were battling so desperately to win what seemed to be a hopeless struggle. The days were bad, but the nights were a hundred times worse, for the difficulties of steering the boat were of course infinitely harder in the dark. The night of the third day was the worst of all; and even the two brave men who were now for practical purposes the only working members of the crew must have felt the chill of despair creep into their hearts. Both were utterly exhausted; for three days they had scarcely tasted a mouthful of food, and had not slept for a second. The fight seemed drawing to a close; another day would surely end in a victory for those immense green masses of foam-flecked water that pursued the little boat so unceasingly, so relentlessly. But as the fourth day broke the weather began to moderate, and ere noon, for the moment at any rate, the awful tension was over, for the water had become comparatively calm, and there was no immediate fear of destruction. Tollemache took an observation, the first that it had been possible to take since the start of the voyage, and, to his horror, he found that the boat had drifted two hundred and fifty miles out of its course. This meant that their voyage, instead of being nearly half-over, as they had hoped, practically had not yet begun. But the two

brave men who had first volunteered to make the voyage did not for an instant despair, and their energy, resolution, and cheerfulness kept up the failing spirits of their comrades. The wind had now died down altogether, and sailing had become impossible; there was nothing, therefore, to be done but to row. For three days, night and day, such of the crew as could pull an oar took their turn to row, doing four hours at a stretch; then a breeze sprang up at the end of the third day, sail was set, and on the ninth day the voyagers entered Colombo harbour. That evening a steamer, with Tollemache and Bruckland on board, left for the coral-reef to rescue the five hundred lives, for whom the two officers had so daringly risked their own.

In many instances medals have been awarded to men for acts of bravery which have resulted in the saving of even a single life—for example, when a man falls overboard and is rescued by a comrade; but it has been exceedingly difficult to find details of such cases. One of the few cases of this kind the particulars of which have been preserved is that of the rescue of a ship's carpenter, under circumstances that rendered the act a very heroic one, by Chief-Officer Syndenham, of the *Alleghany*. The carpenter, by the way, was Mr Syndenham's brother. The *Alleghany*, bound for New York, had been five days out from Liverpool, and was slowly making her way against a tremendous sea and in the teeth of a gale, when the cry was raised, 'Man overboard!' The second officer, hearing the cry, threw a life-belt into the sea, telegraphed to the engine-room to stop the engine, and put the helm hard over to make the vessel swing clear of the man in the water. Syndenham was in his berth at the time; but, hearing the cry of 'Man overboard!' he rushed up on deck, and on learning that it was his brother who was in the water, at once plunged into the sea to save him or die with him. To all on board it appeared that both men must be drowned. An incident of this sort at sea moves very quickly; three minutes after the carpenter had fallen overboard he was several hundreds of yards from the vessel, and his brother was making desperate efforts to get up to him. In the meanwhile a lifeboat had been lowered from the ship; but in the high sea that was running she was instantly smashed to pieces against the side of the vessel. Then the expedient of pouring oil on the water was successfully adopted, and a second boat, with four men in her, was safely launched. Whilst this was being done Mr Syndenham had by an almost superhuman effort managed to reach his brother, and then began a fearful fight for life between the courageous officer and the mountainous seas that every moment engulfed him and his brother. The carpenter was exhausted, and could make little effort to keep himself afloat, so his brother had to battle for him as well as for himself. For nearly fifteen minutes the life-and-death

struggle lasted in the raging waters before the brothers were rescued by the crew of the lifeboat. There yet remained the task of getting back to the *Alleghany*, and that this took fifty minutes to accomplish will give some notion of the sea that was running, and of the extent of the risk that Mr Syndenham faced to save his brother's life.

Lloyd's also bestow a medal for conspicuous acts of bravery which result in or contribute to the saving of vessels and cargoes at sea, and this medal has been gained by actions quite as daring and heroic as any of those described.

The story of how Captain Jarvis and A. F. Fyfe, engineer, saved the *Den of Airlie* from destruction is one of the most thrilling episodes of the sea. The *Den of Airlie* was some two hundred miles from Bombay, for which port she was bound, when one night a fire broke out in her hold. A fire at sea is at all times a danger which has its terrors for even the bravest of sailors, but the fire on the *Den of Airlie* was rendered peculiarly appalling by the fact that next to the hold were a hundred tons of gunpowder. Captain Jarvis, on the outbreak of the fire, directed the two lifeboats to be lowered at once, and every man on board was ordered into them. The officer in charge of the boats was told to row them to a safe distance from the ship, that was now as dangerous to be near as the most deadly mine ever laid to bring destruction upon the ships that might pass over it. But the captain of the *Den of Airlie* and Mr Fyfe remained on the burning ship, resolved to save her or perish with her. The two men worked at the pumps, pouring water into the hold, and as they worked the smoke rose from below in huge clouds, choking and stifling them, and ever and anon they saw a great red tongue of flame leap up, cutting the smoke like a bright sword. But the brave men never hesitated, never flinched from the battle, though they knew that a second might bring instant and utter destruction upon the ship and upon themselves. Undaunted and undismayed, the two kept up their desperate attack on the flames, and at length their efforts began to have some effect; the smoke still came up from the hold in great volumes, but it was no longer rent asunder by those bright tongues of flame. The fire was quenched, and Lloyd's medal was never more deservedly won.

Happily the story of how Captain John Macmillan, Mr Charles Bell, and Mr L. H. Thomsaas of the *Titanic* gained the medal has also been preserved, and is a tale worth the telling. The *Titanic*, when about two hundred miles from Buenos Aires, lost her propeller and smashed the tail-end of her shaft. In such a condition the ship was helpless, and there was nothing to be done but to set to work and fit on a new propeller. Had the water been smooth this would have been no very easy task to accomplish,

but with a half-gale blowing and huge seas running, it became a herculean and immensely dangerous one. In the first place, the whole cargo had to be shifted forward, in order to hoist the stern of the ship out of the water as high as possible. This was a piece of work that in itself was a most difficult and dangerous one, owing to the rolling of the vessel, and it took three days to accomplish, during which time the disabled ship drifted miles out of her course into solitary ocean-tracks where there was not the slightest chance of sighting another ship. But the removal of the cargo was mere child's-play to the work of fixing on the propeller. The propeller, which weighed six tons, was slung over the stern in chains and carefully lowered until it was brought into proper position opposite the shaft. The task of fitting it was fraught with danger, and the three officers mentioned above—namely, Macmillan (the captain), Bell, and Thomsaas—resolved to undertake the job themselves. They were lowered from the stern with ropes passed round the waist of each, and whilst one was at work his two comrades had to hold him to prevent him being swept away by the immense seas that were running. The three toiled night and day. During the night they worked by the light of burning oakum and tar lowered over to

them in a bucket from the deck towering high above them out of the water. One night, as the bucket was being lowered, a sudden lurch of the vessel upset a quantity of the burning stuff on the toilers below. Mr Bell was the chief sufferer; his hand was badly injured by the burning liquid, but he did not think of ceasing work. At the end of five days' frightful toil, as hard and as difficult and dangerous as has ever fallen to sailors to perform, the propeller was fixed and the ship became once more a controllable thing. Lloyd's Committee had, of course, no hesitation in awarding their medal for meritorious service to the three officers for this achievement.

As has been said, it is extremely difficult to find details of the acts of heroism by which this V.C. of the merchant service has been won. Some extraordinarily brave acts are recorded in the briefest language. For example, one finds that 'John Tender rescued Fireman Ernest Smith from drowning, who fell overboard in a fit. Rescue took place in shark-infested water,' the last few words being specially significant of the daring character of the action thus briefly and tersely recorded. But they are deeds which are worthy to rank high in the annals of British heroism.

THE BOAR'S FOOT.

CHAPTER III.

AT the Casino Donald went in, and the excellent Achille turned his steps to Ciro's. There, as he expected, he found the old gentleman; and yet he had to look twice before he recognised him. What had happened? What had so changed the man? Instead of sitting with his *Times*, spruce, well preserved, and undeniably well turned out, with clear eyes and upright figure, Achille saw before him at the usual table only a weary-looking and worn-out old man. His eyes were tired, dull; the moustache that was always brushed up so smartly now drooped in a manner that was positively Low Church. His whole figure languished; he looked old and wretched and ill.

'You do not look vairy well,' said Achille at once, sitting down beside him.

'I am perfectly well,' snapped Sir Donald with some of his old temper; 'perfectly well. But I have had a great blow.'

'Tell me, I beg.'

'You know I told you Gobert, that robber at the corner, showed me a coin, a copy of the genuine Nimes things. I took him mine this morning to compare with it. All these years I have considered mine to be real; yes, and all Europe thought so too. The other had just been bought by a tourist, but that makes no difference. It is—not genuine.'

'Ah, what a blow!' cried Achille, his heart beating with delight. 'What a vairy dreadful blow! But how do you know it is false?'

'We looked at the book—Cuyler's book on Provençal coins. Gobert has gone away, but Schenck is there, who knows even more than he. There is no doubt—no doubt at all. And how I could have been deceived all these years I cannot think.' Sir Donald spoke in a wearied, colourless tone.

'No,' murmured Achille.

'Apart from the fearful disappointment of it, the worst of the thing is that I must let people know that mine is false—the museums, the collectors, the authorities on the subject. It is horrible.'

Achille almost felt sorry for him. There he sat, a broken dream before him, and the dream was a pitiful one after all. Merely to be the possessor of a crocodile coin—bah!—and a pearl, a real pearl, that might be his—was indeed his—walking about in white flannels in the Casino, ready to be snapped up again by any soft-eyed woman! It made Achille sick to think of it, and his heart hardened again.

'Why did you tell me a lie yesterday?' he asked.

'A lie? When? What are you talking about?'

'You told me you had not a son. Why did you lie?'

'Confound you!' cried the old gentleman with a flash of his old manner; 'it is *not* a lie. He is *not* my son. He was, perhaps. Not now. A young fool, married to another fool, but not such a fool as he is. Why, who the devil told you?'

'You yourself,' replied Achille amiably; 'and I am not talking, as you know, out of impertinence and curiosity about your affairs. I am a man who neither has nor ever had wife, or handsome son, or coin collection. And I hardly know what to say to any man who has had all three, and lost them, lost them irrevocable.'

He had chosen his moment well. His old friend was too much overcome by the magnitude of his loss to have any angry retort ready. He did not even tell him to mind his own business. He just sat there looking old and wearied and thin.

'You have nothing left—no, nothing,' repeated the apple-grower, fixing stern black eyes on his companion. 'Not even a heart.'

'A heart?'

'No, indeed, monsieur, you have no heart. You have a lump of lead perhaps, but nothing else; it is a parallelogram, it is a rhomboid, and it is made of gun-metal, of reinforced concrete; yes, a rhomboid of concrete, the reinforced kind.' And Achille glanced across the little marble-topped table.

'I tell you *zis*,' he went on, his black eyes flashing and his moustache twitching with scorn, 'because it is true. What about that tall, handsome son of yours, *ce joli garçon*—but then, what of him? And as for your brains, monsieur, they are no better—no better,' looking round for a simile, 'than the brains of a lettuce.'

'Hold your tongue! What the deuce are you talking about?' began the old man, and he half rose.

'Sit down, sit down,' commanded Achille, and he still looked very fierce, twice as fierce as Sir Donald, who suddenly seemed quite tired, and sank back again.

'Now,' said the Frenchman, in the voice of an examining judge in the Court of Cassation—'now, tell me, *what did you do with the letter he wrote you?*'

Sir Donald positively quailed before the fiery glance and voice. 'Letter?' he said. 'I burnt his letter unopened. Threw it into the fire. But what business is it of yours?'

'Ah!' retorted Achille, though his heart bounded with relief and delight; 'then you did not read that the lady would not have him?'

'Eh?'

'She would not have him. Not without his money. She broke it off.'

'Ah,' said Sir Donald, with an attempt at recovery, 'then I was right. She only wanted his money.'

'Oh, la, la! what she wanted, or what any other woman wants, is only known to *le bon Dieu*. But regard! What have you done? You have lost him, and you have lost everything else. Look how you treat him. You burn his letter in which he said you were right. *Ah! mon Dieu*, what a fool you were, dear friend, to burn that letter unopened! He waits for the answer; he does not get it. He hears no word. Silence. And he goes off. He has made his *amende honorable*, and he is treated—oh! of the most cruel. Then now, in Monte Carlo, what do I see happen—I, Achille Gaston Beaulande, with my own eyes? I see *zat* young man (*sac à papier!* I should have run you through)—I see him raise his hat and stand uncovered before you. And you, what do you do? Eh? Eh?' And the Frenchman's eyes sparkled with righteous wrath, his moustache bristled, he glowed with anger.

Sir Donald sat there uncomfortably. He took from Achille what he certainly would not have taken from any other man living, and he took it quietly. A new light broke in upon his life, and he saw it as a selfish and lonely one. He sat down, lost in thought; and Achille, in wisdom, did not interrupt him. He looked back on his life, on his marriage, on the boy's coming and childhood. Then the sudden leap, so it seemed, to manhood, and that terrible scene in the library of his town house. He sighed.

'*Voyons*,' said Achille in a more forgiving tone, 'nothing is ever ended except the stupid things; the good things, and the nice ones, they go on for ever. Shall we go, *mon ami*, to the jeweller, and ask to have that book again to look at? There is certainly some mistake.'

'Very well, perhaps there is some mistake,' repeated Sir Donald, as though it might be true, and he got up, and they went across to the shop.

Monsieur Gobert had gone to Paris, but Monsieur Schenck was in.

'You wish to see the book again?' he asked. 'But certainly; here it is. I think you will find that there is no mistake in what I said.'

And here was the young Donald just coming in with his yachting friend.

Schenck left his customer with his nose in the book, and went forward.

'Good-morning,' said Donald, in his clear voice. 'Is Monsieur Gobert in?'

The man who was bending over the book raised his head a little and listened.

'No, monsieur; he is in Paris. What can I have the pleasure?'

'Well, I wonder if you would look at this coin for me? I should like your opinion on it, if you will be so good.'

'Ah, but with pleasure.'

'Gad! he's going to say it's a real one,' said the man from the yacht.

Schenck still looked at the coin critically, seriously. Then he looked up, and his face was grave.

'This object you bring me, can you tell me perhaps where you procured it?'

'Certainly. I bought it in a shop.'

'I return it to you,' said the jeweller, 'and offer you my congratulations on possessing it. That is a Foot of the Boar coin, and it is a genuine one.'

'You're in luck, Donald,' said a lazy voice.

'Allow me to congratulate you also,' said Achille very pleasantly. 'You see, I was to be trusted in my guess.'

But Schenck still stood with round, serious eyes, as though he could hardly believe his own words. 'There is no doubt—there is no doubt at all,' he went on. 'There are only seven known.' Suddenly he remembered his other customer, and turned toward him, actually allowing a little excitement to creep into his voice. 'A most extraordinary coincidence, monsieur. Here is yourself, who bring a coin that is mentioned in all the catalogues for years, and it turns out to be a false one. This gentleman brings me one he has picked up somewhere, and, *houppé-là!* it is genuine.'

As he talked the old gentleman turned round and looked at the others. A gleam of light passed through his eyes—a flash only, but it had come, though it was gone. And Achille saw that flash, and he rejoiced. Something of the old dignity had come back too, and Sir Donald held himself upright. And his son stood opposite him, erect and motionless. They were amazingly like each other.

'It is extraordinary,' began Schenck again.

'Not at all,' put in Achille briskly; 'not the least in the world. Here is Sir Donald Carnegie, who thought for some time zat he had a genuine treasure, and now he finds he is

mistaken, it is worthless. What is more extraordinary, and a great deal more interesting, is that he has always had a treasure, a genuine treasure, and for a long time he has thought it to be worthless.—Is it not so? But you do not think zat now, Sir Donald; do you?'

'No.'

The voice was not like Sir Donald's at all. It was low, subdued, almost humble. He looked across at his son. And his son still kept his hat on, and stood motionless.

'I was wrong, lad. I was hasty. I am sorry.' The three sentences fell quietly from the old gentleman's lips.

Donald made a quick step forward. 'I am sorry too,' he said frankly. 'I was wrong and hasty.'

'Ah! zat handshake!' said Achille beneath his breath. 'Zat English handshake, it always makes my teeth ache to see it.'

'Come, *mes amis*,' he cried; 'come and have *déjeuner* with me. I will not hear "No." I invite you all. You will all come and have a bifteck with me at Ciro's. Come along—come along. *Tiens!* the old coin—and whose is zat, I wonder?'

'It is not mine any longer,' said the young Donald. 'It belongs now to my father's collection.'

'*Allons*,' cried Achille again, 'let us hasten, or we shall get no bifteck;' and he drove them out in front of him.

'Ah, now,' mused Monsieur Schenck, as he returned to the counter, 'this is an unusual incident. As if I did not know exactly where it came from! But I should very much like to know how that young man got hold of Sir Donald Carnegie's coin and exchanged it for his. I should very much like to know that.'

THE END.

THE QUEST OF THE TUNA.

By F. G. AFLALO.

'TRY, try, try again!' is a policy which should, at any rate, deserve success in the great things of life as well as in the small. It gave the Pole to Peary, and no doubt it has given to others the final achievement of lesser ambitions. It may be that I also shall try again for a tuna, the one fish in all earth's seas that has so far baffled me; but, after having in the course of several trips travelled over twenty-five thousand miles out and back without even hooking one, it seems well to give that large and wayward mackerel a rest, and to ponder on the hollowness of life.

Yet there is something peculiarly interesting in the extraordinary range of the tuna on the atlas. Looking at the Mercator map of the

world, we find the centres of great tuna, or tunny, fisheries to lie as far apart as Madeira, California, Cape Breton, and Turkey. Surely not even a Chinaman is more indifferent to extremes of temperature. From the sweltering Mediterranean, where it has from time immemorial been caught, and where it is seemingly as plentiful to-day as when the shepherds of Theocritus used to look down from the cliffs of Sicily on its frantic shoals, to the wild waters of Newfoundland, where there is ice for six months and fog for twelve, the tuna has its summer home. Where it spends the winter is a mystery that possibly unsounded depths of the Atlantic and Pacific could alone reveal. In summer, however, it returns to its accustomed

haunts with almost the regularity of salmon and swallows, and the scenes amid which I have sought it in vain are as varied and as curious as any in my fishing trails.

I see the tunnies once more being hauled on board great fishing-boats off Porto Santo and Madeira by a howling crowd of Portuguese fishermen, half-a-dozen of whom strain at the stout line, while another stands by to beat the great fish to death as its mighty head comes over the side. Already a score of tunny, none of less than a hundred pounds, and some of twice that weight, lie festering in the hold, for it is the practice to fill the boat to the water's edge before returning to the market at Funchal. The poor peasants of the islands have not the nose of a Billingsgate inspector, and they gladly buy stale tunny at a halfpenny the pound. For days together I went afloat with these rogues to try my luck with rod and line; but there was a dark conspiracy to keep me from the fish for fear that my success might inspire the despatch of an English fleet to scour the grounds! This was a compliment to my own skill and to the enterprise of Grimsby which a mutual explanation would have waived.

The scene changes, and I am in a little caique on the Sea of Marmora, drifting idly among the beautiful Princes' Islands, and waiting for the afternoon breeze to hoist the sail. As my little craft passes within twenty yards of a *talian*, one of the fixed nets of Turkish seas, which from the Middle Ages have been in European hands, the lookout man, a Levantine Greek, sings out to my boatman that there is something heavy in the net. So we range alongside and hold the outer rope, while, in response to his frenzied cries, a boatload of sturdy fellows puts off from the shore. Under the command of an apoplectic-looking *reis*, who has seemingly been roused from his siesta to the prejudice of his manners, and whose language is appalling, the men hurriedly get in the net, and I am presently peering down through fifteen or twenty fathoms of clear water at some great dim forms that swim wildly round and round the narrowing confines of their prison. Nearer to the surface they come perforce with the lessening net, and now I can clearly see eight or nine enormous tunas, one of them weighing probably six or eight hundred pounds, dashing to and fro in a mad effort to recover their liberty. It is too late; and, as the last of the net is stowed away in the boat, the mighty giants lie flopping helplessly on their sides. Out come the gaffs and grappling-hooks, much the same as those used in dragging bales of cotton along the wharves; and now the sea is incarnadined with blood, and the crimson foam, the death-struggles of the fish, the shouts of the men, make such a pandemonium as is rare

in these quiet waters. The *reis*, his swarthy face streaming with perspiration, his smock flecked with red and drenched with spray, does the work of two, and even finds time to urge his men to renewed effort lest any prize escape. There is little enough chance of it, and in a few minutes the last great fish is bleeding from a dozen wounds and helpless in the boat.

Amid quieter surroundings the tuna is sought for pleasure, not for profit. Where northern firs bend to the cold blast on the cliffs that overlook St Ann's Bay, in Cape Breton, schools of immense tunas, few of them less than six hundred pounds in weight and many exceeding a thousand, chase the squid and gaspereau all the summer months, churning up the water in their mad pursuit, and causing consternation among all save the terns and other seawolf that hover overhead to pick up the crumbs from their table. More than one season now anglers have voyaged to this beautiful inlet, which faces Newfoundland, to catch these tunas on the rod; but so far in vain, though many have been hooked and lost, and one fisherman even fought one with might and main for nineteen hours, all through a long September night. Next morning he had to cut the line, and the fish went off, seemingly as fresh as at the start. There also, in salt water which freezes so hard some winters that men drive teams over the inner harbour, I dragged my unwelcome baits before the noses of these unresponsive fish, but they would have none of me, so that I could not even taste the joys of having loved and lost.

The metropolis, so to speak, of tuna-fishing for sport is Avalon, on Santa Catalina Island, southern California, where a club named after this noble fish is dedicated to the sport, and where, under its hospitable auspices, amateur fishermen forgather each summer from the ends of the earth. The tuna does not return to Catalina Island with quite the same regularity that marks its homing elsewhere. Every few years it stays away for a season. With singular intuition, I managed to light on one of those years for my visit to the island. Abundance of other fishing I enjoyed with the light tackle prescribed by local regulation, and better sport I never had in the sea; but of tuna never a sight! My own impression, after these twenty-five thousand miles of failure, is that I shall catch my tuna by accident. With the possible exception of some sharks, no other fish of its size roams so far and wide over the world's seas, and it may be that, frustrated in my set purpose, I shall one of these days encounter a school when I am on the track of other fish, and then and there utter the *Nunc dimittis* of a lifelong quest. I hope so.

THE CAVALRY TWINS.

A TALE OF THE GRAND ARMY.

By RUSSELL THORNDIKE.

THE Cavalry Twins were the two Duvals, Henri and Alexandre; and there was no great love lost between them. Henri was lieutenant of heavy artillery, while his brother held the same commission on the rolls of the Blue Chasseurs, the finest regiment of light horse that Napoleon had ever put into the field—fellows who had rollicked through Austerlitz, Jena, Friedland, Smolensk, and Moscow, and had much to be proud of; and the Blue Chasseurs were not wanting in conceit, for their uniforms encouraged it, their glories demanded it.

During the brief inaction of hostilities, their swaggering in Paris led to many a sudden quarrel, and often to most disastrous results, for the Emperor had catalogued private brawling amongst his soldiers as criminal, because at that time he could ill afford to lose good men, except on the field of battle and for the glory of France. 'For is it not criminal,' he is reported to have said, 'to kill each other privately in the cafés, when our enemies are waiting to be butchered in the open field?'

But, for all that, the café brawls, led on by the prodigal arrogance of the officers, were by no means suppressed, and the little tavern at the corner of the Rue de Rivoli was frequently the scene of much violence and bloodshed, as the case of the Cavalry Twins will show.

One night when Alexandre Duval was there the usual squabbles were going forward—the old comparison of regiments' individual merits. The café was crowded with various officers, and these were all talking at once and all looking dangerous. A white-haired colonel, in the uniform of the artillery, was endeavouring to keep the peace, for he was the senior officer present, and felt responsible.

'Gentlemen, gentlemen!' he cried, 'there is no need to quarrel over this. Why, every Frenchman is of the same mind in the matter. Certainly there is not a single regiment in the Grand Army that has not won glory for the Emperor; and then, perceiving a good point to be made in favour of his own regiment, he added, 'but without the artillery there would have been no Napoleon to win glory for.'

'God shield the Emperor of Gunners!' shouted the artillerymen.

'That Napoleon started soldiering as a gunner was his misfortune, and not his fault,' shouted a dragoon.

'Ah, well, then,' continued the colonel, 'if you will not take Napoleon as an example of the men that our regiment can turn out, there is young Henri Duval. As Napoleon before him, he is but a lieutenant of gunners. However, he

is the Emperor's right-hand man. How do you account for that?'

'Henri Duval is said to be the dullest-witted young officer in the Grand Army,' retorted the dragoon.

'And how can that be?' cried the colonel. 'Will you say that the Emperor delights in dullards? 'Twere treason to say so, besides being ridiculous. Henri Duval is continually sent into the gravest posts of danger; and it is because he is an artilleryman, and can be trusted and relied upon before others.'

'The merits of the artillery had nothing on earth to do with the case,' said a gentleman clad in the graceful pelisse of the Blue Chasseurs.

'What the devil do you know about it?' exclaimed the colonel.

'Everything,' answered the hussar; 'and what I know I will tell you, for it is devilish curious and devilish unjust. If I did not place the honour of my regiment before that of my family, I should not tell that which tarnishes severely the name of the Duval House. But I want to prove to you that the Emperor does go to the Hussars before your regiment, or any other for the matter of that, when he is in need of a good man.'

'Well, let's hear your story,' said the colonel; 'but take care, sir, that you say nothing that seems to throw disparagement upon my regiment; for in that case, sir, you shall have the honour of fighting me on the conclusion of your tale.'

'Delighted to meet you, colonel, whenever you please. I will tell you my story, and you shall judge for yourself.'

'In the first place, I have to state that the position now occupied by my brother Henri was first offered to me. Under the circumstances, I found it impossible to take that position. It was against my very conscience. Henri thought otherwise, obeyed orders, and committed a crime which should lie very heavily upon his soul. These are the bare facts of the case. Now you shall have the details.'

'It was before the last campaign, and our regiment was quartered in Paris, to be near the Emperor in case of trouble. Well, we were playing cards in this very café—I and my brother Henri against two dragoons. In the middle of our play a courier entered by that door, and, stepping up to the table in the window where we were playing, he said he had a message from the Emperor for Lieutenant Duval. You can imagine that the courier looked just a little disconcerted when two Lieutenants Duval sprang up from opposite sides of the table and asked for the royal command.'

"My message is only for Lieutenant Duval," he said.

"Well, sir," said I, "my name is Duval, lieutenant of Hussars—the Blue Chasseurs. In what way can I serve the Emperor?" For, you see, my friends, I was very certain that the Emperor would go to the Hussars when he needed to pick a man."

The artillerymen tugged angrily at their moustaches, and tried to interrupt; but Duval, with equal fierceness, rattled his sabre-tache, and went on with the narrative.

"My brother was, of course, of different opinion; so, throwing out his chest in the vain endeavour to make his uniform compare favourably with mine, he said as bold as brass that his name was also Duval, and that, being a lieutenant of artillery, there was no doubt at all as to which of the brothers Duval the Emperor had need of."

"He spoke well! There *was* no doubt!" ejaculated the artillerymen.

"I," continued Duval, "consigning my brother and the rest of the artillery to the devil, told the courier that Lieutenant Duval would wait upon the Emperor immediately; and, suiting the action to the word, I picked up my sabre and dashed for the door. My brother, however, had the impudence to follow my example, and so there we were both running like mad through the streets of Paris. But, my friends, we cannot expect a lumbering officer of artillery to make much show as an athlete, especially against a light-cavalryman."

"Because the artillery have no practice at showing their heels," chimed in the colonel.

Duval clinked his spurs sharply, looked very fierce, and continued, "But with low cunning that rascally fellow was near getting even with me, for he began shouting, "Stop thief! Deserter!" and such things, until a very pretty Parisian mob was racing at my heels; and as we were nearing the palace I ran smack into a cohort of gendarmes, and was compelled to leave my mark on some of the rascals before getting quit of them. At the corner of one street some of my pursuers had hedged me off by a short cut. The fools linked arms across the road, and made a valiant effort to stop me. But was it possible for a line of civilians to hinder Alexandre Duval of the Blue Chasseurs when the Emperor had need of him? Ah no, my friends; and so those rascals discovered, for I dare to swear that at least three of the vermin wear broken noses to this day."

"Well, I very soon reached the great antechamber, and was disappointed at finding it thronged with Ministers, for it took me some time before I could get hold of the right man to announce my arrival to the Emperor. I had just succeeded in accomplishing this difficult task when my brother entered the *salon*, puffing like a transport-mule."

"It was not very long before the pompous little usher called my name, and I can tell you

it was a great sight to see me swagger through the crowd of cringing civilians, and my personal opinion of the Emperor went up at a bound that he did not keep an officer of Hussars waiting. In fact, the pride of that moment banished all other thoughts from my brain, or I might have saved an artilleryman from disgracing his regiment by the violation of the Court. For that vagabond brother of mine steps in front of me at the very door of the Emperor's sanctuary, and picking up bodily the little usher, hurled him with the strength of an ox full at my head; and before the infuriated little official had scrambled to his feet, before I had pulled my tunic straight and ejaculated "*Sacré!*" the door was shut to in my face, and my brother was saluting the Emperor on the right side of it."

"My friends, I went mad. I cursed the usher; I beat upon the door. I called the Ministers names that should only be used in action. Terrified at my behaviour, they tried to hurry me from the apartment; but I now hit upon a strategy that would only have occurred to a light-cavalryman. On one side of the anteroom there were five enormous French windows, opening out upon a broad terrace. These windows were closed tight, for the day was cold. Now I argued that the window of the Emperor's sanctum would probably lead on to the same terrace, and in this I was not mistaken, as you will soon hear; for, with a whoop like a scalping Indian, I dashed across the room, clearing the passage with the flat of my sabre, and then leapt straight for the window, crashing through the thick glass for all the world as if it were but thin ice. Well, I was hardly through one window before I was back through the other; and, scarcely realising what I had done, there was I, Alexandre Duval, lieutenant of the Blue Chasseurs, saluting the Emperor with the blood pouring from my cheeks and the broken glass rattling behind me."

"The Emperor had at the first sound of the smash jumped up to his full height, which I remember at the time did not strike me as being very great; but most men look dwarfs to me."

"And who in the devil's name are you?" he said.

"It was the first time I had heard the Emperor swear, and you can imagine it was not a very pleasant thing to hear, especially as a means of introduction."

"I am here in the name of the Emperor," I said. "I am Lieutenant Duval of the Blue Chasseurs."

"And is it a habit of yours, lieutenant, to enter rooms to the tune of tinkling glass? Have you no respect for the worth of good windows that you jump through them as lightly as circus-hoops? I really think that the damage you have done deserves some explanation, sir;" and the Emperor looked positively furious. But I had not been born the son of a diplomat for nothing, so I parried his wrath by touching his vanity.

"Sire," I replied, "the Emperor that we are taught to serve in the Hussars is one whose lightest words must be fulfilled, death alone frustrating it, and certainly not such a trifling thing as a few square feet of coloured window-glass. I was told, sire, that this same Emperor had need of me; and so, failing to gain an entrance through the door, I executed the flank action that you have but now witnessed, and here I stand awaiting the Emperor's orders."

"The Emperor smiled, and touched a small silver gong that stood upon the table. Instantly a door opened at the other end of the room, and, to my astonishment, who should enter but my father, the grand old Chevalier, who I thought was miles away in Corsica!

"Were you mad, or your wife," asked the Emperor of my father, "that you happened upon such lunatic sons?"

"Their mother is dead," replied my father, "so I will take no unfair advantage. My sons are twins; both good men, capital soldiers, and equally high in my favour. I can recommend them both for your special service, sire."

"Unfortunately, *mon Chevalier*, I have only one special position to offer, and the man I choose will be my right-hand man whilst the army is in Paris, and perhaps after that; who knows? For the great debt that I have long owed you, my friend, I would have one of your sons to hold that post. They are twins; one is a lieutenant of cavalry, the other of artillery; and you treat them with equal favour. How am I to decide? It is a great pity that your wife had twins, for it places me in an awkward position." There I think that the Emperor was unreasonable, for how can a good woman help bearing twins?

"It has been a good thing for France," replied my father hotly, "for my sons have acquitted themselves well in her battles."

"I know it, *mon Chevalier*," returned the Emperor. "Times without number have they deserved the decoration."

"Which neither of us has yet received," I ventured to suggest, for I did not wish the Emperor to labour under a wrong impression. But he did not take kindly to the suggestion, for we were immediately dismissed to our quarters, whilst my father stayed with the Emperor.

"That night I received an order to hold myself in readiness against leaving Paris, for the Emperor would require my services upon the morrow. So, thought I, the Emperor has decided in favour of the Hussars, after all; and I could not help thinking that he was wise.

"I tell you, my friends, that the time dragged heavily with me, for I was possessed with curiosity to know the nature of the work before me. I lay awake all the night, and I remained in my rooms all the following day; but no news did I receive, and when the bugle sounded "Lights out" I gave up hope. Now I had sent

my orderly out for news, so that when I heard a tap at my door I growled "Come in!" in a surly manner, for I was in no very good humour. The door opened, and—oh good heavens! why had I not been studying *De Bello Gallico* instead of lounging with my feet upon the mantelboard, for there before me stood the Emperor?

"Lieutenant Duval," he said, as he shut the door behind him, "I am about to give you a unique opportunity of serving your Emperor and increasing the estimation that I already bear toward the officers of your regiment. The enterprise that I am about to entrust to you is of dangerous consequences, for you will have against you the cleverest enemy of France, a man who, should he escape you, will cause the gravest trouble to the country. In short, you have to do with a crafty traitor."

"You have but to acquaint me, sire, with this gentleman's name to avoid all uneasiness concerning him," I said, as I stood as straight as a needle, facing the Emperor.

"Sir," he replied, "you must not be too sanguine of success, for indeed 'tis odds against your returning alive to tell the tale."

"Be that as it may, sire," I answered, "I shall do my best to carry out your commands."

"Finely spoken," he said. "Do you know Pamphille?"

"I wheeled round, placing my finger upon an ordnance map of the Parisian environs that was pinned to the wall.

"Yes, sire; it is here. A small village to the north of Paris. Inhabitants: seven hundred and sixty; rising ground to the north-east, wooded to the north; narrow river skirting those same woods upon the south supplies the village with water. With a hundred Hussars I could take the village from the south-east, and with fifty I could hold it for as long as the Emperor required. Alone, sire, I should first cut off the water-supply, and then"—

"Silence, sir!" said the Emperor. "It is sufficient that you know the place. I am not sending you as a besieging party, or as a public orator—for I had been talking as fast as a cavalry charge—but as my special executioner to shoot down a traitor. Now listen. Half-an-hour after I have left this room you will take horse and ride for Pamphille. You will pass through the village, and along the Calais road till you reach the first cross-road. You will then take the bridle-path which you will observe amongst the hedged wood on the left, and proceed a hundred yards down the hill. You will then tie your horse somewhere in the woods, and proceed on foot till you reach a wooden gate. This is the gate of an empty château that was a fine house before the Revolution. It is now empty. To-night the conspirator I have told you about will come to meet his confederates. He will carry away with him certain papers that I must recover. You must secrete yourself some-

where near the grand entrance. You will have no difficulty, for the garden is a veritable wilderness of undergrowth, and you will find many good laurel-bushes skirting what was once the drive. The man will leave the house alone. You will cover him with this pistol, which I have loaded, call on him to stop, and cry out, 'It is Napoleon's pistol that shoots!' I want him to realise that it is my power that has checked his treachery; so, directly you have uttered these words, you will shoot him dead, take what papers you can find upon him, and run for your life, for I need not tell you that you will arouse a horde of conspirators about you. You will then report yourself to me at daybreak with the papers. Is this all clear?"

"Perfectly, sire."

"Then, good-night, lieutenant;" and the Emperor was gone. And half-an-hour later so was I, clattering through the streets of Paris with the Emperor's loaded pistol in my belt, his words ringing in my ears, and a splendid horse beneath me.

'And what is there more thrilling than a night ride upon a good broad road that has danger at the end of it? How the great black trees shot waving behind us, as my horse went like the wind, and perhaps faster, for the dust-clouds could never overtake us! The villagers were all abed, but many a blind shot up and many a curtain was hastily drawn aside as I thundered through the little hamlets that cluster around that great white road that plunges straight back into Paris. In some cases the windows were thrown open, and scared voices called to me for news, for no one knew in those days where would be the Emperor's next battle. However, I paid no heed to anything, but, keeping up a high-tension gallop, soon reached Pamphille, and thundered through it. Three minutes later, drawing rein at the cross-road, and trotting off again into the blackness of the bridle-path, at last I found the gate that the Emperor had warned me about. I tied my horse to a stout tree, and left him there, I verily believe to the poor beast's disappointment at not sharing in the game after having come so far in its cause; and then I crept toward the house.

'The night was dark and the garden full of undergrowth, so that I was obliged to advance with great care, for I did not wish to be heard from the house, and was near stumbling once or twice. It was a grand old chateau, for I could make out its turrets and pinnacles against the skyline; but, judging from the garden, I conjectured it to be in sad need of repair. I made for the old carriage-drive, as I knew that by following its course I should come upon the front-door; and in this I was not mistaken. There was a lighted stable-lantern hanging from beneath the porch, and in front of it the drive swept in a wide arena around a circular flower-bed. And straight into this flower-bed I got, and, tucking

as much of myself away as possible, I waited with my hand grasping Napoleon's pistol, and my eye fixed steadily upon the door beneath the stable-lantern. As you know, my friends, I have fought in a hundred battles, and have known long vigils before the appointed time of being up and doing, but I never have endured such terrible suspense as when I crouched in that circular flower-bed, waiting to shoot down a man in the coldest blood. It appeared to me to be little short of murder, even though the man were a traitor, and I could not help the longing to cross my blade with him, instead of shooting him down from the darkness; for, although the result would have been the same in either case, I could not help feeling more justification in this method of attack.

'It must have been two or three hours that I lay there, arguing with myself, and after a while it began to pall upon me to such an extent that I stamped out by force of will all my qualms of conscience, kindled my fighting blood, and longed to get at the man; for, after all, the Emperor was responsible, and it was nothing to do with me. Why, the Emperor had even loaded the pistol with his own hand. It was his quarrel entirely. I was simply the trigger in his hand. So that you see, by arguing in this fashion with myself, I was prepared when the door at last opened and the man stepped out beneath the porch. I was ready to kill him, whoever he was; and I should soon discover that, for he turned his face in my direction, and unhooking the lantern as if to signal to some confederate sentinelled in black woods behind me, he held it motionless above his head; and—my God!—the rays beat down upon his face. My finger pulses froze. I let go the pistol. The weapon of Napoleon fell into the flower-bed. It was the will of God that I should fail; for, although I would not shrink from a thousand deaths for my Emperor, I could not murder my own father for him or for France, however black a traitor he might be. And when this truth burst upon me in all its naked hideousness my brain reeled, and I became unconscious.

'When I came to myself I had a colossal problem to face. In the first place, I had failed in my trust. The Emperor would show me no mercy. As a soldier I was as culpable as my father, for discipline has no use for sentiment. My father had gone, so there was nothing else for me to do but to go also—back to Paris to face the Emperor's anger. But this, my friends, I could not bring myself to do, and for the whole of the following day I secreted myself amongst the laurel-bushes, terrified lest I should be discovered before I had hit upon some definite course to pursue.

'And now, gentlemen, when the cup of my sorrows was at its full, I received another shock that my brain could barely support. I had lain numbed in body and spirit through the next day,

and well into the following night, when I heard in the distance some one treading through the garden. I need not describe to you in detail what I have already told before. A man had crept up the drive and was hiding in the circular flower-bed. Presently the door of the house opened, and, carrying a lantern in his hand, my father walked toward the flower-bed. I heard a voice cry, "Hands up!" Up went the lantern, and by its light I saw my father's face. "It is Napoleon's pistol that shoots!" There was a flash, a loud report, and my father fell forward, shot through the heart. The assassin kicked out the lantern and fumbled over the body. He was collecting those damnable papers. Then he turned and ran; and as he ran I knew who he was. Gentlemen, the man who killed my father was my father's son, my own brother Henri, and this is how he carried favour with the Emperor.

'Gentlemen, I am aware that this story attacks the very first principle of a soldier's life—discipline. But how far must discipline be carried against the ties of God? That is the question that I put to the Emperor when I faced him. But he declined to hear my arguments, and placed my brother over my head upon his special staff. However, I think that I am not entirely out of favour, for did I not receive the coveted decoration during the last campaign? And now you know why my brother was put over my head. It had nothing to do with the merits of his regiment.'

'No, my dear Alexandre, it had simply to do with common-sense.'

Nobody had noticed the tall artilleryman who had listened to the story from the back of the room. It was Henri Duval, and as he spoke he lounged into the circle and sat upon one of the marble-topped tables. 'You are a capital hand at a yarn, my brother,' he said, 'and you certainly have the knack of carrying the cockpit with you. But I must really—in self-defence, you know, and to clear my father, who, by the way, is not dead at all, but alive and kicking in Portugal or somewhere as secret agent of the Emperor. In the first place, my father is no traitor; and, in the second place, I am not such a fool as I look, although this gentleman here'—and he jerked his thumb toward the dragoon—'was good enough to describe me as—what was it?—ah yes, as the dullest-witted young officer in the Grand Army. Well, maybe I am something of a dullard, but I certainly am not so foolish as to depend upon another man's weapons for my life.'

'What do you mean?' gasped Alexandre.

'Simply this,' continued Henri. 'The night after you left Paris I had the same little performance with the Emperor, only I happened to hear him coming in time, and so *was* discovered poring over *De Bello Gallico*. As soon as he had gone I wrote out his instructions, for I have a very bad memory, and then I examined the pistol which he had laid upon the table. On discover-

ing that it had been loaded without a bullet I own I was a bit mystified, for I suppose that you are taught even in the Blue Chasseurs the importance of loading with a bullet. Well, the Emperor had evidently some good reason for this, else why was he so set upon my using his pistol? Mine was just as good. I should never have solved this problem had I thought for a week, for you see I am something of a fool; but, all the same, I was not going to be made a bigger one, so I slipped my own pistols into my belt in case of accidents. The rest of the story you have already described so graphically that it is not necessary for me to enlarge upon it. But for a few facts.

'As soon as I perceived that the traitor was my father, I knew that the whole thing was a joke, for indeed were I to see my father sell his country beneath my very eyes I should not believe it, because I know that my father has always put France before all things. Now, if the Emperor wanted a little joke, who was I, a humble lieutenant of artillery, to upset it? So I fired the blank-loaded pistol, and was highly amused to see my dear old father double up like a rabbit. Indeed, he did it so uncommonly well that for the moment I had some misgivings as to whether or not I had used the right pistol; but I quickly reassured myself on this point, and then I collected those damnable papers, which were simply blank sheets, and not even sealed together, and rode back to Paris. The Emperor expressed himself satisfied with my conduct, and ordered me at once to carry certain despatches of grave import to the Austrian capital. I said that I would gladly undertake to do this, only I should like to make one stipulation, and that was that in future I should be permitted to load my own pistols. You see, I did not want him to think that he had fooled me; for, although I do not mind looking the greatest fool in the army, I do certainly object to being that man. Don't you agree with me, Alexandre?

'But good-night, my friends. I must be getting back to the palace.'

And the artillery twin went out of the tavern; and so did the Hussar, but not with the usual swagger of the Blue Chasseurs!

THE PATH OF LIFE.

HE clutched the broom with baby hands:

'I'll sweep the path for you.'

Too big the brush, too wide the path;

His utmost strength he threw,
And toiled his hardest, all in vain,
The rustling dead leaves still remain.

So we, intent on sweeping clean

The wide-set path of life,
Grasp at a broom beyond our strength,
And plunge into the strife;
And God looks on with tender smile,
Content to let us sweep awhile.

EDITH L. ELIAS.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

IN the mind of a brooding meditator upon the anxiety of the times there may arise, in the month of April of 1916, a disposition to take for text of a chain of thoughts on a splendid theme a considered judgment of the elder Dumas, as he set it down in writing. He said: 'After God, Shakespeare has created most.' For its comprehension, its discernment, and its utter truth, this declaration by the greatest of the brilliant company of romancers of France is inimitable. It is well at such moments as this to think of creators and creating. Destruction cuts and burns and explodes its insane way over the face of the earth that for thousands of years has betokened its desire to conjure up new beauties from the vast storehouse that Nature holds. England is scarcely rich in the tangible forms of homage she sets up to her greatest children, and in particular to those whose efforts were as from the spirit divine, and not the result of mere schemes in materialism, of strength of will, and of the power of a politician's personality. Sometimes she seems quick enough to give honours to men who by craftiness and a certain worldly genius collect millions in moneyed treasure for themselves; but she is not so prompt to display at a little cost her indebtedness to the few who have given her a spiritual pride and glory that are as deathless as the nation. She is willing enough, she remembers, and she may adore; but here, it seems, is a case to apply the national habit of procrastination. So we look about us in London vainly for a great monument to him who is not so much a prince of our own literature as a king of the world, our possession of him envied by none so much as by our bitterest enemies. It is true there is a statue to him in Westminster Abbey, where it has been for nearly a hundred and eighty years. Our careful and conscientious forefathers made the public sacrifice of a few pounds to pay for it. On the scroll that is held by the hands of the stone figure are the great and appropriate lines from *The Tempest*:

The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve;
And, like this insubstantial pageant faded,
Leave not a rack behind.

No. 274.—VOL. VI.

A bubble financier, Baron Albert Grant, had a copy of this statue cut by Fontana and set up in the middle of Leicester Square some forty years ago. It is a trifle; hardly more than that. One looks in vain in London for any other monument. To name a street after the poet of the world is easy enough. Shakespeare is a popular title for alleys in suburbia. But the public places where statues may be put seem to be needed most for kings and politicians, reminding one of a remark made by a witty Scottish writer that the usual school history is a piece of snobbery; it cannot keep away from kings and queens, who do not matter, since history should be the story of the people. It is true; and there is the same snobbery in our monuments. There is perhaps but one in London that by its degree of dominance is worthy of its subject, and there is fault even to be found with that. We know another column from the summit of which it would not be unfitting to remove the royal figure and make room for one of the nation's truly great. In the shadow of this pompous erection, put away at the side where it may not be an inconvenience and need not be seen unless it is assiduously sought, there is a new statue, a small one, to Captain Robert Scott, which his brothers in the navy set up in his memory. This great man of the little statue went to the uttermost end of the earth in search of knowledge that might help an achievement that would for ever glorify his countrymen. No other Briton ever went so far, and he gave his life for the great enterprise. 'Had we lived I should have had a tale to tell of the hardihood, endurance, and courage of my companions which would have stirred the heart of every Englishman. These rough notes and our dead bodies must tell the tale.' These words of his own last-written message are cut upon the base. That is the latest monument to be set up in London; it is well that we have it. That of Florence Nightingale, near by, and also within the shadow of the towering Duke, was the one before it. Most of us since our childhood have heard of schemes, mere schemes, many meetings, multitudes of words, some resolutions in the business-like way of committees and commissions, for the foundation and endowment of a great national memorial theatre in London, dedicated to the fame of

[All Rights Reserved.]

FEBRUARY 26, 1916.

Shakespeare; a real temple of drama which would be a fair token of a people's gratitude for the beauty given to life and thought by Shakespeare, and the majestic entertainment he has yielded to us. But unfortunately there have been fewer subscriptions than speeches, and the people with millions, anxious to do good, have seemed to fear that, if they built such a theatre as might relieve a nation from the shame of neglect and ingratitude, there might be some danger of their own celebrity being overshadowed by that of the immortal dead. But, after all, it is stupid and out of proportion thus to complain of the lack of stone Shakespeares. Why, is there not something almost splendid in the idea that we raise no buildings, fix up no effigies—save just the one that a rich man gave to London ere he turned bankrupt—to the most transcendent genius of his kind who has ever lived, a superb creation of spiritual man, one who, as the great Frenchman said, had, next to God, created most? England is rich indeed that she can afford such neglect. Always she can give the excuse that Shakespeare truly is his own monument; that a column ascending from the steps by the old German Embassy to the very sky itself, and not merely to the simple height that the Duke of York is at, would be a monument infinitely less impressive, possessing not a millionth part of the spiritual value of a little volume of Shakespeare that might be bought for a shilling.

* * *

There is scarcely an intelligent man or woman in the land who does not, consciously or unconsciously, every day of his or her life, utter words that are in themselves a memorial of Shakespeare, reared by himself in the greatness of his mind. Those whom, with no offence, we may call the common people would find their means of expression, their elaborations of speech, simple as they may be, far more difficult and disappointing had there been no Shakespeare born at Stratford. Unknown to themselves, all persons capable of thought and speech are given in some measure to the art of analogy. To liken one thing to another is the simplest, crudest expression of the power of intelligence. The instinct of analogy is a point that one does not remember to have seen discussed; but reflection must justify it, however novel it may seem. The veriest child, hardly more than a lisping baby, begins with efforts at analogy as soon as he tries to express himself to an elder. He has seen outside something large, something tall, and in a mood for exaggeration, which is another instinct with the child, he goes to his father and says that it was as big—as big—as big as—but the mannikin of an experience not yet extending beyond the garden boundaries is short of material for comparison, and so analogy fails. It succeeds in matters of lions and such like, which seem to be so well within the scope of children's thoughts,

and are recognised standards of ferocity and strength. A dog is seen to run in the streets, and possibly chase a cat, and seems menacing even to the child himself. He retreats in some alarm. The incident maintains a hold upon his mind, and in the nursery some time later he gives an account of it. If it differs from the actual fact, it is merely because there has been a passing of time, and by a law of human weakness, which seems to be inexorable in its working, and never more so than in the childish mind, plain truth is garnished by the lapse of hours and days and years. It is not falseness or deceit; it is the generous habit of nature to make memories good by enriching them. Old age would be unbearable indeed did the heroics of our youth lessen in colour and intensity when preserved in the mind for occasional remembrance. The habit, or, rather, the instinct, is trained from the beginning, and so in the nursery the terrier that frolicked in the street at noon assumes the proportions and the manners of the finest African lion. This is analogy in its simplest and crudest form, as first practised by little children. The dog and lion is as the pothook of comparison. But lions only will not serve for life; continual analogy, the exercise of the instinct, is necessary for speech and explanation. It is used by every people, civilised and uncivilised, in every land. In England it is as rich and apposite as elsewhere, and the embellishments of the language as practised by the common people are perhaps as good and tasteful, as suggestive of imagination, as those of any other people, although the Briton has not such qualities of temperament and fancy as, say, the French. His speech abounds in borrowed aphorisms and analogies; and there is only this fault about them all, that after a little while they lose their freshness, and become trite. This is the more obvious the higher the speaker's degree of social state. At a village wedding-breakfast it might be pleasant if the chief speech-maker were smilingly to declare that what somebody had once said to the effect that the course of true love never did run smooth had now been proved untrue; but if the Shakesperian line—uttered so many millions of times, since Shakespeare first put it into the mouth of his Lysander—were quoted by a young lady in a drawing-room in Mayfair, it would be received with coldness and disregard. The mines of Shakespearian analogy and aphorism are richer and less exhaustible than the coalfields of the earth, and there is little excuse for such careless surface pickings. It is worse than this; it is a contempt of Shakespeare, who is thus used without being read, and therefore we must applaud Mayfair for its chilly disdain. So with the pound of flesh, so with the times that are out of joint, and so with ten thousand other phrases. Shakespeare fills our common speech to-day; he dominates our expressions, controls the analogies; and so it comes about that he is ever the founder

of the people's most popular embellishments of speech. Beautiful and ingenious thoughts, superb apophorisms, have, as is the way with words, been vulgarised and spoiled by reckless and often inappropriate use. Yes, Shakespeare and the inspired writers of the Scriptures were, as we may put it, the master-makers of the most-quoted apophorisms. They first said the greatest things that all the world has uttered since. So there is the monument of the mighty Shakespeare on the tongues of every one of us at this time, three hundred years since his life gave out. And whatever the influence and power of these analogies and apophorisms, proverbs and maxims, may be—and it is quite impossible to think that, repeated and reflected upon millions of times in every year, they are without great influence indeed—it must surely be for good. In a few piercing words that pin themselves fast to mind and memory, Shakespeare drives home a tremendous truth in a form in which it will be preserved and be most effective, and his teaching is always on the side of virtue and the beautiful in life. We may put his works next to the Bible itself in the effect of their moral teaching, which has all the greater strength inasmuch as it is unobtrusive. How often the balance of inclination may have been turned from wrong to right at the final moment by recollection of some old Shakespearian phrase! And the pity of it all is that the vast majority of the persons thus guided have never read an entire scene or act or play of Shakespeare. It is a tragedy of British life and education, the appalling misconception of the leaders and organisers of that education about what makes the best teaching for the heart and mind of the young boy and girl of this realm, fitting them to take their places in the Empire and maintain its material and its moral greatness. The real, essential truths of life and conduct are pressed into the very being by a Shakespearian play as they could be in no other way, because of the beautiful and subtle form in which they are presented. And yet, though the thoughts and words and matchless imagery of Shakespeare are one of the greatest of our modern heritages, the least study of him is not compulsory in our elementary schools, though it might be of vast advantage, spiritually and materially, to the child. Precious time is wasted in useless teachings, and not a moment can be spared for this. Is it not a shame upon us that any child should be sent out to the work and life of the world without having read at least one of the plays, and learned by heart a dozen of the majestic speeches with which they abound? Alas! the best is too much taken for granted in modern ways and systems of life.

* * *

This appalling war is to be a war of purification for ourselves as well as others. It is to lift our thoughts to higher things. So it is said. Yet, as I write, what is being presented at the

theatres of the capital! On the eve of the Shakespearian tercentenary there is being given at several theatres the most inartistic and idiotic form of public entertainment ever invented, known as the revue. This is what England sees when the war is wearing on in its second dreadful year! Last night I went some way out from the heart of London to see Mr Benson present again *A Midsummer Night's Dream*, worthily and lovingly done, as all Mr Benson's work is done. Few of his profession have ever served the British people to such good advantage. And, oh! again the everlasting beauty, the transcendent imagery, the exquisite fancy of this fairy play! It is the most grateful recollection of my schooling that, from the first word to the last of it, I was taught it as a boy of twelve, the first play I ever read, and in my mind it has continually grown in wonder and beauty since. Every child, for his future happiness, should be given it to carry with him in memory through the world of sorrows. Compulsory Shakespeare, as I think, is one of the few redeeming features of the system of University Local Examinations which have placed such a fatal premium on a stupid mechanical cramming, and stultified the powers of thought and initiative in the mind of the modern child. For the good of his patriotism, every boy at school this year should be acquainted to the full with the fervour of *King Henry V*. On the twenty-third of the month of April the tercentenary will be reached. What will be done in the way of commemoration in Britain is a matter that has not at the moment been completely decided. Many people say there should be nothing, or next to nothing, because of the war. That war is an efficient excuse for many omissions, but a poor one in this case. Five millions a day for slaughter, but not a thousand pounds for a festival of three hundred years of Shakespeare! But yet there will be a little. At Stratford Mr Benson will give commemoration performances. On the thirtieth the churches will begin a celebration, and thereafter there is to be a Shakespeare matinee at a London theatre, something is to be done in the schools, and there will be speech-making at the Mansion House! At a rough estimate Spain is doing ten thousand times more than this in memory of Cervantes, who died on the same day. But it is in the power of every person to make a little commemoration of his own, and it should be done, by the old in their homes and by the young at the schools. Something should be done to gain more knowledge than the little that is possessed about the prince of poets. There is no story of life and work that is more fascinating than his. Apart from the transcendent merit, the immortal quality, of his work, it is incomprehensible how the master could in a single lifetime have produced so much. One must go back to the judgment of Dumas and appreciate that 'after God, Shakespeare

created most.' It is the *Life of Shakespeare*, written by Sir Sidney Lee, the best Life that we have, that has reminded me of this tribute. It has recently been revised and much enlarged, and it is the standard work upon the poet. This book is better worth reading at the present moment than any other book I know. I wish I could attempt to tell in a dozen articles a little of this fascinating story. As it is, I dare but make a snatch from the last chapter, in which a 'general estimate' is attempted. 'Many forces,' says Sir Sidney Lee, 'went to the making of Shakespeare's mighty achievement. His national affinities lie on the surface. A love of his own country and a confident faith in its destiny find exalted expression in his work. Especially did he interpret to perfection the humour peculiar to his race. His drama was cast in a mould which English predecessors had invented. But he is free of all taint of insularity. His lot was thrown in the full current of the intellectual and artistic movement known as the Renaissance, which, taking its rise in Italy of the fourteenth and fifteenth centuries, was in his lifetime still active in every country of western Europe. He shared in the great common stock of thought and aspiration, in the certain hope of intellectual enfranchisement, and in the enthusiastic recognition of the beauty of the world and humanity—to which in his epoch authors of all countries under the sway of the Renaissance enjoyed access. Like all great poets, Shakespeare was not merely gifted with a supreme capacity for observing what was passing about him in nature and human life, but he was endowed with the rare power of assimilating with rapidity the fruits of reading. Literary study rendered his imagination the more productive and robust. His genius caught light and heat from much foreign as well as domestic literature. But he had the faculty of transmuting in the crucible of his mind the thought and style of others into new substance of an unprecedented richness. His mind may best be likened to a highly sensitised photographic plate, which need only be exposed for however brief a period to anything in life or literature in order to receive upon its surface the firm outline of a picture which could be developed and reproduced at will. If Shakespeare's mind came in contact in an alehouse with a burly, good-humoured toper, the conception of a Falstaff found instantaneous admission to his brain. The character had revealed itself to him in most of its involutions as quickly as his eye caught sight of its external form and his ear caught the sound of the voice. Books offered Shakespeare the same opportunity of realising human life and experience. A hurried perusal of an Italian story of a Jew in Venice conveyed to him the mental picture of Shylock, with all his racial temperament in energetic

action, and all the background of Venetian scenery and society accurately defined. A few hours spent over Plutarch's *Lives* brought into being in Shakespeare's brain the true aspects of Roman character and Roman inspiration. Whencesoever the external impressions came, whether from the world of books or the world of living men, the same mental process was at work, the same visualising instinct which made the thing which he saw or read of a living and a lasting reality. No analysis of the final fruits of Shakespeare's genius can be adequate. In knowledge of human character, in perception and portrayal of the workings of passion, in wealth of humour, in fertility of fancy, and in soundness of judgment, he has no rival. It is true of him as of no other writer, that his language and versification adapt themselves to every phase of sentiment, and sound every note in the scale of felicity.'

* * *

The thought may sometimes enter the mind of an inexperienced and undiscerning man on seeing Shakespearian plays presented, as they are done in modern times, that the bare words of the text, sublime as they are, gain assistance from the modern embellishments of stagecraft. He may see *The Merry Wives of Windsor*, or *The Merchant of Venice*, or *A Midsummer Night's Dream*, and ask if Shakespeare could have imagined all that just as it is shown. But with better knowledge and perception he would understand that the imagination of Shakespeare was beyond all these, our poor adornments, and is dependent for its appeal on none of them. Consider the readings and the varieties in presentation of *Hamlet*. You may see it done gorgeously at His Majesty's Theatre, or with the severest simplicity of a little black cloth, and not much besides, by Mr Martin Harvey. In essentials the force is the same, or, if it is not the same, the advantage lies with the simplicity. Many years ago I saw Madame Bernhardt play *Hamlet*. A few nights since I heard that same voice of gold keyed up in patriotic feeling as never before in her denunciation of the fiends, our common enemy, in *Les Cathédrales*. It was a great achievement, an ennobling presentation. In a circle outside of us were the inane revues! But Madame Bernhardt gave us help and hope. She seemed to remind those who needed any such reminder that art and beauty are things of eternity, that passion and feeling will last for ever, as wars and revues will not. As her most gifted countryman, M. Anatole France, has said, the whole immense effort of civilisation has for its end the beautifying of life; in mankind there is an incessant desire, a perpetual need, for ornamenting it. And of all the beautifiers of life, does not William Shakespeare occupy the very foremost place?

THE DAY OF WRATH.

CHAPTER X.—ANDENNE.

MADAME JOOS was old for her fifty years, and heavy withal. Hers was not the finer quality of human clay which hardens in the fire of adversity. She became ill, almost seriously ill, and had to be nursed back into good health again during nine long days. And long these days were, the longest Dalroy had ever known. To a man of his temperament, enforced inactivity was anathema in any conditions; a gnawing doubt that he was not justified in remaining in Verviers at all did not improve matters. Monsieur Garnier, the curé, was a frequent, though unobtrusive, visitor. He doctored the invalid, and brought scraps of accurate information which filtered through the far-flung screen of Uhlans and the dense lines of German infantry and guns. Thus the fugitives knew when and where the British Expeditionary Force actually landed on the Continent. They heard of the gradual sapping of the defences of Liège, until Fort Loncin fell, and, with it, as events were to prove, the shield which had protected Belgium for nearly a fortnight. The respite did not avail King Albert and his heroic people in so far as the occupation and ravaging of their beautiful country was concerned; but calm-eyed historians in years to come will appraise at its true value the breathing-space, slight though it was, thus secured for France and Britain.

Dalroy found it extraordinarily difficult to sift the true from the false in the crop of conflicting rumours. In the first instance, German legends had to be discounted. From the outset of the campaign the Kaiser's armies were steadily regaled with accounts of phenomenal successes *elsewhere*. Thus, when four army corps, commanded now by Von Kluck, were nearly demoralised by the steadfast valour of General Leman and his stalwarts, the men were rallied by being told that the Crown Prince was smashing his way to Paris through Nancy and Verdun. Prodiges were being performed in Poland and on the North Sea, and London was burnt by Zeppelins almost daily. Nor did Belgian imagination lag far behind in this contest of unveracity. British and French troops were marching to the Meuse by a dozen roads; the French raid into Alsace was magnified into a great military feat; the British fleet had squelched the German navy by sinking nineteen battleships; the Kaiser, haggard and bleary-eyed, was alternately degrading and shooting Generals and issuing flamboyant proclamations. Finally, Russia was flattening out East Prussia and Galicia with the slow crunching of a steam-roller.

Out of this maelström of 'news' a level-headed soldier might, and did, extract certain hard facts. The landing of Sir John French's force took

place exactly at the time and place and in the numbers Dalroy himself had estimated. To throw a small army into Flanders would have been folly. Obviously the British must join hands with the French before offering battle. For the rest—though he went out very little, and alone, as being less risky—he recognised the hour when the German machine recovered its momentum after the first unexpected collapse. He saw order replace chaos. He watched the dragon crawling ever onward, and understood then that no act of man could save Belgium. Verviers was the best possible site for an observer who knew how to use his eyes. He assumed that what was occurring there was going on with equal precision in Luxembourg and along the line of the Vosges Mountains.

Gradually, too, he reconciled his conscience to these days of waiting. He believed now that his services would be immensely more useful to the British Commander-in-Chief in the field if he could cross the French frontier rather than reach London and the War Office by way of the Belgian coast. This decision lightened his heart. He was beginning to fear that the welfare of Irene Beresford was conflicting with duty. It was cheering to feel convinced that the odds and ends of information picked up in Verviers might prove of inestimable value to the Allied cause. For instance, Liège was being laid low by eleven-inch howitzers, but he had seen seventeen-inch howitzers, each in three parts, each part drawn by forty horses or a dozen traction-engines, moving slowly toward the south-west. There lay Namur and France. No need to doubt now where the chief theatre of the war would find its habitat. The German staff had blundered in its initial strategy, but the defect was being repaired. All that had gone before was a mere prelude to the grim business which would be transacted beyond the Meuse.

During that period of quiescence, certain minor and personal elements affecting the future passed from a nebulous stage to a state of quasi-acceptance. There was not, there could not be, any pronounced love-making between two people so situated as Dalroy and Irene Beresford. But eyes can exchange messages which the lips dare not utter, and these two began to realise that they were designed the one for the other by a wise Providence. As that is precisely the right sentiment of young folk in love, romance thrived finely in Madame Béranger's little *auberge* in the Rue de Nivers at Verviers. A tender glance, a touch of the hand, a lighting of a troubled face when the dear one appears—these things are excellent substitutes for the spoken word.

Irene was 'Irene' to Dalroy ever since that

night in the wood at Argenteau, and the girl herself accepted the development with the deftness which is every woman's legacy from Mother Eve.

'If you make free with my Christian name, I must retort by using yours,' she said one day on coming down to breakfast. 'So, "Good-morning, Arthur." Where did you get that hat?'

The hat in question was a purchase, a wide-brimmed felt such as is common in Flanders. Its Apache slouch, in conjunction with Jan Maertz's oldest clothes and a week's stubble of beard, made Dalroy quite villainous-looking. Except in the details of height and physique, it would, indeed, be difficult for any stranger to associate this loose-limbed Belgian labourer with the well-groomed cavalry officer who entered the Friedrich-Strasse Station in Berlin on the night of August 3rd. That was as it should be, though the alteration was none the less displeasing to its victim. Irene adopted a huge sun-bonnet, and compromised as to boots by wearing *sabots en cuir*, or clogs.

Singularly enough, white-haired Monsieur Garnier nearly brought matters to a climax as between these two.

On the Wednesday evening, when the last forts of Liège were crumbling, Madame Joos was reported convalescent and asleep, so both girls came to the little *salon* for a supper of stewed veal.

Naturally the war was discussed first; but the priest was learning to agree with his English friend about its main features. In sheer dismay at the black outlook before his country, he suddenly turned the talk into a more intimate channel.

'What plans have you youngsters made?' he asked. 'Monsieur Joos and I can only look back through the years. The places we know and love are abodes of ghosts. The milestones are tombstones. We can surely count more friends dead than living. For you it is different. The world will go on, war or no war; but Verviers will not become your residence, I take it.'

'Jan and I mean to join our respective armies as soon as Monsieur Joos and the ladies are taken care of, and that means, I suppose, safely lodged in England,' said Dalroy.

'If Léontine likes to marry me first, I'm agreeable,' put in Maertz promptly.

It was a naïve confession, and every one laughed except Joos.

'Léontine marries neither you nor any other hulking loafer while there is one German hoof left in Belgium,' vowed the little man warmly.

The priest smiled. He knew where the shoe pinched. Maertz, if no loafer, was not what is vulgarly described as 'a good catch.'

'I've lost my parish,' he said jestingly, 'and, being an inveterate match-maker, am on the *qui vive* for a job. But if father says "No,"

we must wait till mother has a word. Now for the other pair.—What of you?'

Irene blushed scarlet, and dropped her serviette; Dalroy, though flabbergasted, happily hit on a way out.

'I'm surprised at you, monsieur!' he cried. 'Look at mademoiselle, and then run your eye over me. Did ever pretty maid wed such a scarecrow?'

'I must refer that point to mademoiselle,' retorted the priest. 'I don't think either of you would choose a book by the cover.'

'Ah! At last I know the worst,' laughed Dalroy. 'Who would believe that I once posed as the Discobolus in a *tableau vivant*?'

'What's that?' demanded Joos.

Dalroy hesitated. Neither his French nor German was equal to the translation.

'A quoit-thrower,' suggested Irene.

'Quoits!' sniffed the miller. 'I'll take you on at that game any day you like for twenty francs every ringer.'

It was a safe offer. Old Joos was a noted player. He gave details of his prowess. Dalroy, though modestly declining a contest, led him on, and steered the conversation clear of rocks.

Thenceforth, for a whole day, Irene's manner stiffened perceptibly, and Dalroy was miserable. Inexperienced in the ways of the sex, he little dreamed that Irene felt she had been literally thrown at his head.

But graver issues soon dispersed that small cloud. On Saturday, 15th August, the thunder of the guns lessened and died down, being replaced by the far more distant and fitful barking of field batteries. But the rumble on the cobbles of the main road continued. What need to ask what had happened? Around Liège lay the silence of death.

Late that afternoon a woman brought a note to Dalroy. It bore no address. She merely handed it to him, and hurried off, with the furtive air of one afraid of being asked for an explanation. It ran:

'DEAR FRIEND,—Save yourself and the others. Lose not a moment. I have seen a handbill. A big reward is offered. My advice is: go west separately. The messenger I employ is a Christian, but I doubt the faith of many. May God guard you! I shall accompany you in my thoughts and prayers.—E. G.'

Dalroy found Joos instantly.

'What is our curé's baptismal name?' he inquired.

'Edouard, monsieur.'

'He has sent us marching orders. Read that!'

The miller's wizened face blanched. He had counted on remaining in Verviers till the war was over. At that date no self-respecting Belgian could bring himself to believe that the fighting would continue into the winter. The first comparative successes of the small Belgian army,

combined with the meteoric French advance into Alsace, seemed to assure speedy victory by the Allies. He swore roundly, but decided to follow the priest's bidding in every respect save one.

'We can't split up,' he declared. 'We are all named in the *laissez passer*. You understand what dull pigs these Germans are. They'll count heads. If one is missing, or there's one too many, they'll inquire about it for a week.'

Sound common-sense and no small knowledge of Teuton character lurked in the old man's comment. Monsieur Garnier, of course, had not been told why this queerly assorted group clung together, nor was he aware of the exact cause of their flight from Visé. Probably the hand-bill he mentioned was explicit in names and descriptions. At any rate, he must have the strongest reasons for supposing that Verviers no longer provided a safe retreat.

Jan Maertz was summoned. He made a good suggestion. The direct road to Andenne, *via* Liège and Huy, was impracticable, being crowded with troops and transports. Why not use the country lanes from Pepinster through Louveigne, Hanoir, and Maffe? It was a hilly country, and probably clear of soldiers. He would buy a dog-team, and thus save Madame Joos the fatigue of walking.

Dalroy agreed at once. Even though Irene still insisted on sharing his effort to cross the German lines, two routes opened from Andenne, one to Brussels and the west, the other to Dinant and the south. Moreover, he counted on the Allies occupying the Mons-Charleroi-Namur terrain, and one night's march from Andenne, with Maertz as guide, should bring the three of them through, as the Joos family, in all likelihood, would elect to remain with their relatives.

In a word, the orderliness of Verviers had already relegated the excesses of Visé to the obscurity of an evil but half-forgotten dream. The horrors of Louvain, of Malines, of the whole Belgian valley of the Meuse, had yet to come.

An officer of the British army simply could not allow his mind to conceive the purposeful criminality of German methods. Little did he imagine that, on the very day the fugitives set out for Andenne, Visé was completely sacked and burned by command of the German authorities. And why? Not because of any fault committed by the unfortunate inhabitants, who had suffered so much at the outbreak of hostilities. This second avalanche was let loose out of sheer spite. By this time the enemy was commencing to estimate the fearful toll which the Belgian army had taken of the Uhlans who provided the famous 'cavalry screen.' Over and over again the vaunted light horsemen of Germany were ambuscaded and cut up or captured. They proved to be extraordinarily poor fighters when in small numbers, but naturally those who got away made a fine tale of the dangers they had escaped. These constant defeats stung the pride of the headquarters staff, and 'frightfulness' was prescribed as the remedy. The fact cannot be disputed. The invaders' earliest offences might be explained, if not condoned, as the deeds of men brutalised by drink, but the wholesale ravaging of communities by regiments and brigades was the outcome of a deliberate policy of reprisal. The Hun argument was convincing—to the Hun intellect. How dared these puny Belgians fight for their hearths and homes? It was their place to grovel at the feet of the conqueror. If any worn-out notions of honour and manhood and the sanctity of woman inspired them to take the field, they must be taught wisdom by being ground beneath the heel of the Prussian jack-boot.

If the dead mouths of five thousand murdered Belgians did not bear testimony against these disciplined marauders, the mere journey of the little party of men and women who set out from Verviers that Saturday afternoon would itself dispose of any attempt to cloak the high-placed offenders.

(Continued on page 216.)

A DAY IN THE LIFE OF A PRISON GOVERNOR.

By SIROCCO SMALL.

HIS house is usually situated close to the prison gate.

At six o'clock in the morning the prisoners begin the work of the day, and he pays an occasional early morning visit to watch them mustering and passing out to the workshops to be employed at association labour. After the breakfast-hour the real business of the day commences. Nine o'clock will find the governor in his private room, dealing with a vast pile of special correspondence, the examination of warrants, and the warders' reports for the previous day.

At ten o'clock he proceeds to enter the prison buildings proper, where a number of warders are on duty waiting his arrival. As he enters the central hall from which the long prison galleries radiate, a word of command rings out from the senior warder on duty to a line of prisoners waiting to be brought before him: 'Stand to attention!' The warders salute him, and he passes into a special room, attended by the chief warder and a principal warder. In this room he holds his daily court, and here are witnessed scenes more tragic than those which take place in the public courts of a city. Long usage of a

system which is as unalterable as the laws of the Medes and Persians makes the officials move about it in calm and silent order. There is no bustle, no excitement, no unnecessary speech or movement; all is terribly stern, grim, inflexible. Discipline is the all-predominating impression conveyed—iron, unbending discipline.

The prisoners waiting for an audience are divided into three classes, the first of which desire to make 'requests,' the second are 'on report' for breach of prison discipline, and the others are 'specials,' the exact meaning of which will be seen later. They are dealt with in the order named; and, having seated himself at his desk, the governor signals for the first man. He is marched in, and takes up his stand between two warders in front of the governor's desk. The chief warder asks him his name. He gives it, and the governor has his record of industry, good conduct, sentence, nature of crime, &c., placed before him for reference.

Prisoners' requests are usually easily and speedily dealt with, but sometimes they take strange forms. In order that the reader may better comprehend this little-known side of prison life, I will give details of what I actually saw and heard during a day spent with the governor of one of the very largest of our local prisons.

The first was a request made by a prisoner to be permitted to send out and receive a letter. As he was not entitled to this privilege, he was asked by the governor what grounds he had for his demand.

'I have a kid that was dying when I got pinched, sir,' he said, 'and I can't sleep at night thinking if he is living yet, or dead.'

The governor holds up his hand to enjoin silence. He is a humane man, if a stern disciplinarian. 'Granted,' he says with curt but sympathetic brevity.

Next appears a youth recently convicted and sentenced to two years' imprisonment.

'Well, Smith, what do you want?' asks the governor. He is well acquainted with this youth by reason of his many convictions.

'I want to ask if you will let my own clothes be sent to my home to be kept for me in good condition.'

The governor considers a moment. He is a judge of human nature, and knows something of the habits of folks in this man's sphere of life. 'I can't grant that, Smith, because I have no guarantee that your clothes would ever be returned. Your friends might pawn or sell them, and be unable or unwilling to replace them for you at your liberation. Refused.'

Other minor requests are dealt with, and a note of humour is struck when a prisoner explains to the governor that he had in his possession when brought to prison several plants in pots, by selling which he lived when at liberty, and requests that they should be watered and

cared for during his incarceration. Even the grim countenances of the warders relaxed at the thought of tending with tender solicitude the property of the horticultural prisoner for two calendar months. It resulted in the governor arranging to buy the plants for his own house, and to have the purchase price paid to the prisoner on the day of his discharge.

Another request made was that of a prisoner who wished to write a letter of apology to the man whom he had assaulted, for which crime he was undergoing three months' imprisonment.

Next came the 'reports.' The first was charged by a warder with having refused to complete the allotted task, and disobeying orders.

'What have you to say?' he is asked by the governor.

He enters into a long, irrelevant explanation about his work, and concludes by stating that he was too ill to do the work required of him. His medical record is instantly produced for the governor's information. The remarks entered therein by the prison medical officer convince him that the prisoner is a habitual malingerer. Without comment, he passes a sentence of four days' bread and water in punishment cells.

Another was charged with assaulting a warder and using obscene language to him. In reply to the usual query, he, with convincing earnestness, tells the governor that he did swear at the warder, because he was greatly provoked by the treatment he had received from him. He denies indignantly that he assaulted him, and states that it was an attempt by the warder to strike him which caused the trouble.

'Where did the prisoner strike you?' asks the governor, addressing the warder.

'On the face, sir.'

'Were you marked by the blow?'

'No, sir.'

'Why did he assault you?'

'I ordered him to do more work than he was doing, and he attacked me, sir.'

'But this man's work-sheet tells me that he has performed the required task every day for months past. What reason had you for interfering with him when he has done this?'

The warder looks confused. Turning to the prisoner, the governor merely tells him that the matter is ended, and when he is gone he severely reprimands the warder for his treatment of the man. Happily these cases are rare in the prison service.

A powerfully built man is now ushered in, with his wrists handcuffed. His countenance wears a brutal and vicious hatred of all around him. He is charged with having felled a warder on the previous day by striking him with an iron lever, and rendering him unconscious. He had to be dragged by force to his cell, and during the night he had broken all the windows in his cell, broken the furniture, and torn his bedding

into ribbons. These were produced for the governor's inspection.

'The last time you were before me,' says the governor, 'I thought that seven days' punishment diet would bring you to reason. It has obviously failed, however, and I will not attempt to deal with you now. You will be kept in strict solitary confinement until the next occurring visit of the magistrates to the prison, when you will be sentenced.'

With a quick movement, the man springs at the governor with murder written on his face; but before he can reach him he is seized by the warders in attendance, and dragged, struggling, biting, and kicking, to his cell in the basement of the prison. As quick as it happens, as quick is it over, and all is calm and tranquil as usual. It takes a great deal to surprise an experienced prison official.

The 'specials' next follow. The first prisoner enters, dreadfully pale and anxious-looking. The nervous working of his features is eloquent of his anguish of mind. An official-looking blue-coloured document is placed before the governor, who reads it in silence. The prisoner searches his face for some hint of its contents to relieve his mental suspense.

'You will be produced before the Edinburgh magistrates to-morrow to answer another charge of conspiracy to defraud.'

It is his worst fear realised. A dazed look comes into his face. He sways, is supported by an attendant warder, and passes out.

'Next.'

Again the same haunted look reveals itself on the countenance of No. 2. His is the look of a man without the capacity ever to enjoy the pleasure of a smile. Beaten and crushed; and the system, not yet satisfied, is going to make him endure it all over again. Here is a case in which law is not justice. He has just about completed a long term of eighteen months' imprisonment. In a few weeks he had hoped to be free; free to move as he liked, and free to live for better things. But here is something that will crush him with merciless severity. The governor scans the record of the man's conduct in prison. It is good.

'I have a painful duty to perform, Jones,' he says. 'You will be apprehended on the day of your discharge from here by the Manchester police to answer other charges against you. I regret this, Jones, because of the length of your sentence; but you must hope for the best.'

The prisoner wearily turns away, and disappears from view to suffer all his agony over again.

Next follow a number of prisoners recently committed to prison. The warder responsible for the photographing and the taking of finger-prints enters. He places several photographs of criminals in full face and in profile on the desk before the governor. Names are called

out. They enter, and the governor glances keenly at each man to compare him with the photo taken. If he is satisfied that the likeness is a good one he passes it; otherwise it has to be taken over again for identification purposes.

This brings the 'court' to a close, and the governor sets out, preceded by a warder and followed by the chief warder, to inspect the prison cells. In the larger prisons he takes one of the five or six wings every day, the others being inspected by the deputy governor. The cell doors are unlocked by the warder leading. He orders the prisoner to stand to attention. The governor passes, and the door is again secured by the warder in charge of the gallery.

This done, he visits the workshops and exercise-grounds. As he approaches the latter, the command is given by the officer in charge, 'Exercise, halt!' Then he turns to the governor, saying, 'A hundred and twelve prisoners, all correct, sir;' receives his acknowledgment; and 'Exercise, quick march!' rings out, and the governor passes on. Every party of prisoners he meets on his tour of inspection is halted by the warder in charge, who declares the number of his party, and salutes. The governor can inform himself from the location-slate kept in the central hall how many prisoners are in each party, and should a warder mistake the number it spells trouble for him.

Washhouses, bakehouse, and cookhouse are visited in turn; then the prison hospital, and here he has to listen to requests, &c., by prisoners who cannot attend the official court because of their being sick.

Should there be a prisoner under sentence of death, he next visits him. On his entering the condemned cell, the two warders in charge of the unfortunate man stand to attention and report 'All correct.' He asks the prisoner if he is 'all right,' a somewhat ironical inquiry, which to the reader may sound like a grim jest. This is a very necessary procedure, however, and laid down in the regulations governing the treatment of condemned prisoners. The governor proceeds to inspect the book kept in the condemned cell, which contains the warders' report. This book bears a record of every act of the prisoner during the time he is awaiting execution. The moment he sleeps is stated, the moment he wakes, and his general disposition and demeanour are carefully noted. Even the natural physical functions are not allowed to escape attention. Requests, if any, are made to the governor when he pays his visit, and nothing is denied a condemned man which is compatible with reason and prison discipline. This is always a trying time for a prison governor, and the day before the execution and the actual morning itself find him busy and alert. Preparations for the execution are to be supervised, and the possibility of a hitch must not be entertained. The arrival of the public executioner the night before, and the issuing

of orders about his accommodation within the prison buildings, are all part of his duties. Then come the actual attendance at the scaffold, the removal of the body afterwards, the attendance (in English prisons) at the inquest, the signing of numerous documents in connection with the execution, and a host of minor details which would occupy too much space to enumerate.

The female prison, which is within the same boundary wall, but separate entirely from the main male section, is then visited. The governor

is not detained long here, as the matron relieves him of much of the routine. The same procedure is recognised here, and to give details would be to repeat what has already been written.

The governor is liable to be awakened at any time of the night, and he cannot leave home without a note being taken of his address at the prison gate office, in case of outbreak or other troubles. It will be seen, therefore, that the office of governor of one of his Majesty's prisons is not the sinecure some people consider it.

CANNON THUNDER.

By A. HILLIARD ATTERIDGE.

IN July 1666 the British fleet, under the command of General Monk and Prince Rupert, had put to sea to attack the Dutch fleet under De Ruyter and Van Tromp. In his diary on 25th July Mr Pepys tells how he went to Whitehall and found the Court had gone to chapel, 'it being St James's Day;' and then he goes on: 'By-the-by, while they are at chapel, and we waiting chapel being done, come people out of the Park, telling us that the guns are heard plainly. And so everybody to the Park; and by-and-by, the chapel done, the king and duke into the bowling green, and upon the leads, whither I went, and there the guns were plain to be heard; though it was pretty to hear how confident some would be in the loudness of the guns, which it was as much as ever I could do to hear them.'

Two days later came the news that while the king and Court were listening to the faint, far-off sound of the guns, as they stood on the roof at Whitehall, the British and Dutch fleets were fighting a great battle near the Gunfleet Sands, off Clacton, on the Essex coast, more than sixty miles away. The heaviest guns in the opposing fleets would probably be only thirty-pounders—mere pop-guns compared with the giant naval and siege artillery of to-day.

One does not wonder, therefore, at hearing that the great cannonades of the present war have been heard at even longer distances. In one of his speeches, Mr Lloyd George told how, lying awake at his house on the North Downs, he had more than once heard, in the stillness of the night, the sound of the cannonade in Flanders. During the great battle for Ypres, in November 1914, there were reports from many parts of Kent that the sound of the cannonade could be easily heard. During the fighting in the southern Vosges in the spring of last year, the sound of the firing was heard in the mountain villages at the base of the Matterhorn, more than one hundred and twenty miles from Belfort. The firing was also heard at Geneva. The bombardment of the Antwerp forts, where the huge Skoda

howitzers were in action, was plainly heard at Groningen, in the extreme north of Holland, one hundred and seventy miles away.

A correspondent of a German newspaper gave an interesting account of his sensations during the prolonged bombardment that preceded the great attack of the Allies on the German lines in France at the end of September. It was probably the heaviest cannonade in the history of war. Day after day hundreds of heavy guns were pouring their shells into the German lines. On the front in Champagne between Rheims and the Argonne, where the main French attack was to be delivered, the bombardment was the heaviest of all. The German writer, a doctor attached to a hospital on the Belgian frontier more than fifty miles in rear of the German lines in Champagne, told how all day long he heard the distant roar of the cannonade, now like a dull murmur, now with an intensity of sound that seemed to make the ground tremble. It was a strange sensation, he said, for when he left the hospital in the little Belgian frontier town there was no sign of war anywhere. When he took a walk in the fields everything seemed peaceful, but all the while the sound of guns was in the air, reminding him of his experiences when, as a traveller in Java, he listened to the thunder of a volcano in eruption, but out of sight.

The wonder is not that the tremendous bombardments of the present war are heard fifty or a hundred miles away, but that they are not heard at a much greater distance. Theoretically, we might expect to hear the sound of guns in London whenever there is heavy fighting on the front between Ypres and Arras, where hundreds of guns are often in action within one hundred and fifty miles of the capital. Dover ought to hear the firing nearly every day. The historical experiment which first determined the speed at which sound travels through the air was made under the direction of the French Academy of Sciences in 1738. Two of the small field-pieces of the time, eight-pounders, were used. One of them was placed at Montmartre, the other

at Montehéry. The distance between the two places is just over eighteen miles. The charge of powder used was only three pounds, but the reports could be quite easily heard. Now a blank-cartridge weighing three pounds is a mere squib compared with the driving-charge of a modern heavy gun. For some of the heavy howitzers of to-day the charge is three hundred pounds of a much more powerful explosive than the old black powder. If the firing of a blank-cartridge weighing three pounds could be easily heard eighteen miles away, one might expect that the firing of a shotted gun with a charge more than a hundred times as powerful would be easily heard at least ten times that distance. In fact, in placing the probable distance at which it would be heard at one hundred and eighty miles one is making a very moderate estimate.

But sound plays very curious tricks. There are times when the firing of hundreds of guns is not heard at a distance of a few miles. The direction of the wind and the general state of the atmosphere seem to influence the propagation of sound in ways that we do not completely understand. There is an interesting historical instance of this. At the decisive battle of Sadowa, in the war between Austria and Prussia in 1866, the Austrians held a line of low hills on the west bank of the Elbe in front of the fortress of Königgrätz. Here they were attacked on 3rd July, a dull, rainy day, by two Prussian armies converging upon their position. The main frontal attack of the Prussians, under the command of King William and Von Moltke, was made from the westward, and at the same time a flank attack was made on their right by the army of the Crown Prince of Prussia marching down from the northward and threatening to cut in between them and the bridges of the Elbe. There was a very slight breeze from the north, and as the Crown Prince's army advanced and came into action the flashes of guns and the great smoke-clouds they produced could be seen quite plainly on the hills on the Austrian right about two miles distant. It was evident a great battle was in progress, but the officers and men of the Crown Prince's vanguard could not hear the sound of the firing. Yet the nearest guns were only two miles off, and these were the batteries at the northern extremity of a battle-line extending for miles, in which the opposing armies had more than a thousand guns in action.

This is one of the most striking instances of the kind; but there are several cases recorded in the American Civil War where, though the flashes of guns could be seen at no great distance, their reports could not be heard.

There is another mystery of sound, of which there is yet no satisfactory explanation, though there are many ingenious theories on the subject. This is the existence of what is called

the 'zone of silence.' On 15th November 1908 heavy charges of dynamite were exploded in the blasting operations for the construction of the Jungfrau railway. The explosion was clearly heard for a distance of about twenty-five miles from the north side of the mountain. Then for more than sixty miles the most careful inquiry produced no case of the explosion having been heard. But, strange to say, it was quite certain that the explosion was heard at a large number of places more than eighty-five miles away from the mountain. There were thus three regions, in two of which, the nearest and the farthest, the explosion could be heard, and between them there was this strange 'zone of silence' more than sixty miles wide.

The discussion of this curious fact led to the discovery of other recorded cases of the sound of firing, or heavy explosions, being heard near and far off, and being inaudible in an intermediate space. There is an instance of it in Pepys's Diary. On 2nd June 1666 the English and Dutch fleets were fighting in the Channel, 'half seas over' (that is, half-way across), 'between Dunkirk and Ostend.' The firing was heard in London, but not at Dover. 'It is a miraculous thing,' writes Mr Pepys, 'that we did hear everywhere most plainly the guns go off, and yet at Deal and Dover they did not hear one word of a fight, nor think they heard one gun. This makes room for a great dispute in philosophy, how we should hear it and they not, the same wind that brought it to us being the same that should bring it to them.'

An investigation of the distances at which the heavy bombardment of the Antwerp forts was heard in 1914 shows that the 'zone of silence' began at a distance of about fifty miles from the fortress. It could be heard plainly in the south of Holland; in central Holland it was inaudible, but it could be heard like distant thunder in towns on and beyond the north shores of the Zuyder Zee. Here, again, as in the case of the Jungfrau explosion, the three zones—two of sound and one of silence—were clearly marked, the zone of silence in this instance being about thirty-six miles across. One of the theories by which an attempt is made to explain the phenomenon supposes that the more distant sound is the result of an air-wave deflected from the upper regions of the atmosphere at a point where its constitution is so different that the sound-wave cannot easily traverse it, but is first propagated horizontally and then descends. If this is true, the wave passes over the 'zone of silence' at a height of many miles, and then descends over the country beyond. To the mere lay mind it does not seem a very satisfactory explanation.

On a much smaller scale there appear sometimes to be not 'zones,' but, if one may use the word, 'patches' of silence close to the place where heavy firing is in progress. Perhaps this

is the result of what, with respect to another range of phenomena, men of science describe as 'interference.' This expresses the fact that two series of undulations or waves may so 'interfere' with each other that they become neutralised; to put it simply, the rises in one series filling the hollows of the other. Thus it may happen that within a space of a few hundred yards the firing can be heard by those on the right and left, but is inaudible or indistinctly heard on the intervening ground. Of course there are still more numerous cases where flaws of the wind, or the obstacles opposed by hills or even high buildings, prevent the ordinary propagation of the sound; and, again, it can obviously be made indistinct by nearer sources of noise and disturbance. During the Zeppelin attacks on London the heavy explosion of the bombs and the fire of the anti-aircraft guns were sometimes unheard, even in the night, in districts of the great city that were fairly near the scene of the attack.

To use Macaulay's phrase, 'every schoolboy knows' that sound is the result of undulations in the air. But few realise the tremendous force of the air-waves caused by the firing of a heavy gun. Curiously enough, most people quite understand that an explosion will kill and maim men and throw down walls within its radius of action. But, familiar as they are with this idea, they do not realise quite so clearly that the firing of a big gun is an exceptionally powerful explosion so controlled as to act chiefly in one direction only—namely, in the line of fire along which it drives the shell. The report is produced by the tremendous air-wave which radiates from the muzzle of the gun. The main force of this is expended over a fan-shaped region in front of the muzzle; but there is a complicated series of disturbances, and very violent secondary waves come rushing back to right and left. As the shot leaves the muzzle the air is driven violently away, and the space thus left is filled for a moment with the heated and highly expanded gases produced by the explosion. As this globe of gases collapses when its force is expended, there is a back-rush of the air. Over a wide angle in front of the gun, both to right and left of the line of fire, the explosive force is sufficient to be dangerous to life. When the American fleet destroyed the Spanish cruiser squadron in the running fight off Santiago, the Americans had only two casualties as the result of the enemy's fire, a signalman killed and another wounded. But nine men had to be sent to hospital as the result of serious injuries from the shock of their own gun-fire. When one of our Dreadnoughts was

testing her guns the backwash of the air-wave produced by a broadside burst open doors and flung about the furniture in the officers' cabins, in one case tearing a heavy pedestal desk from the fastenings that secured it to the floor.

Every one who has heard both knows how different is the report of a gun fired with a blank-cartridge at manoeuvres or in saluting from that of the same gun fired in action with a shell. Men soon learn to distinguish the various reports of different types and calibres of guns. The shotted gun seems sometimes to have a double report. The explanation is said to be that a second wave of sound is caused by the rush of air closing in behind the shot as the explosion gases in front of the muzzle disperse and collapse. The whistle of the bullet and the droning noise of the flying shell are produced by the rush of air opening in front of its point and closing in behind it, exactly like the series of waves produced in water as it is cut by the bow of a ship and closes in to form a rippling wake behind her. The soldier says that when you hear the shot and whistle of a bullet it has already passed by. This is true of all modern rifle-bullets, which have a much higher velocity than that of sound. Sound travels through the air at the rate of about three hundred and sixty-five yards in a second. The speed of the bullet and of the shell from most classes of guns is higher than this. The drone of the approaching shell and the explosion as it bursts are both heard by those who are under the fire of the gun at ordinary ranges some seconds before they hear the report of the cannon.

In a heavy bombardment, such as characterises the sieges and the great battles of the present war, the 'cannon thunder' is made up of three different elements. First there are the reports of the guns, then the roaring sound of hundreds of shells flying through the air, and then the explosions of these shells, many of them charged with high explosives of three or four times the force of the old gunpowder. In the great bombardment that preceded the battles of the last days of September in France, the Allies had in action some five thousand guns, of which at least two thousand were what would once have been described as siege artillery, including large numbers of heavy howitzers. On the enemy's side, some thousands of guns were replying, and the bombardment went on for three weeks. The wonder is not that we have reports of the sound of this tremendous bombardment being heard fifty or sixty miles away, but that it did not produce an air disturbance like that of a volcanic eruption which would be heard over all northern France and Belgium and the south of England.

THE MONTH: SCIENCE AND ARTS.

SPINNING AND WEAVING PAPER.

THE heavy demand for hemp, flax, jute, and cotton to meet the requirements for munitions has been responsible for active attempts to discover an efficient and cheap substitute capable of fulfilling the ordinary demands of commerce. Paper at once suggests itself; but the spinning and weaving of wood-pulp have always presented difficulties which appeared to be insurmountable. Naturally the substitute must be produced at a very low figure, in order to enable it to compete commercially with the genuine article. The utilisation of paper in this field is by no means of recent date, as the Chinese and Japanese have for centuries been most ingenious in the uses to which they have applied it. A notable illustration is the employment by the Japanese of their strong Broussonetia paper as a substitute for string and rope, it being twisted into short lengths to serve this purpose. The Germans have spent vast sums in the effort to evolve a cheap and simple means of spinning and weaving wood-pulp, but they failed to achieve commercial success, because they could not devise a method of carrying out the essential operations at a sufficiently high speed to enable the product to compete in price with the article for which it was intended to serve as a substitute. Recently a British firm, which since the war has been engaged upon further research, has triumphed where the Germans failed, having succeeded in perfecting a process whereby the pulp may be spun at a speed four or five times in excess of that secured by the Germans, and at approximately 40 per cent. less cost. The process is simple. The pulp is first cut into strips, the width of which varies according to the width of yarn or rope strand desired. It is then twisted on frames somewhat similar to those used in the textile industries. Subsequently the spools of weft and warp are transferred to looms, where the material can be woven into practically any article desired, of any variety of colour or pattern. The process is now in active exploitation, and should meet with conspicuous success, inasmuch as virtually every article made from jute, hemp, or flax can be reproduced in paper yarn. Naturally the product does not possess the strength characteristic of the substances displaced, but this feature is sufficiently pronounced to render the articles of much commercial value. The 'yarn' may be spun so finely as to be suitable for the delicate foundation of an incandescent gas mantle, for which purpose it is being extensively employed, or so strong and coarse as to be adapted for weaving into sacks to carry grain and cement, for mooring-ropes for ships, and so on. It can also be produced of such a texture and such a colouring

as to form a suitable material for neckties and other articles of personal adornment. So far as these islands are concerned, paper weaving and spinning are in their infancy; but there is a rich and ever-increasing field for articles made from this material, and there is every indication that they will develop into flourishing and important industries.

A NOVEL LAMP FOR CONDUCTORS OF PUBLIC VEHICLES.

The stringent light regulations which have been brought into force in the interests of national safety have rendered the work of the conductors of public vehicles, such as motor-buses and trams, additionally arduous, the giving of change under the new conditions being a source of especial anxiety. The increasing utilisation of female labour in this field has accentuated the many peculiar difficulties which have arisen. In order to facilitate the supply and punching of tickets, as well as the accurate changing of money, a small single-cell electric lamp has been placed on the market. The lamp, of cylindrical form, is provided with an adjustable strap, and is carried round the shoulders in the manner of the ticket-puncher, the adjustment being so made that the illumination from the small one-and-a-half volt bulb, set in an efficient reflector carried in the lower end of the case, is thrown just above the ticket-puncher. The puncher is therefore brightly illuminated, so that the conductor is able to see what he is doing. Moreover, the normal position of the lamp enables change to be given without any difficulty. The fact that the lamp throws its light downwards is exceedingly advantageous, since all the objections to the ordinary flash-lamp—which, when waved wildly about, blinds for a few seconds all those upon whom the flash alights—are eliminated. The lamp may also be used to give light while other tasks incidental to the working of the vehicle are being performed, such as the moving of switches or trolley-poles, which under present conditions cannot be speedily carried out owing to the darkness. The lamp is inexpensive to maintain, the battery being of sufficient capacity to furnish light for about fifty working hours.

A NOVEL SAFE FOR THE HOME.

'Safe bind, safe find!' runs the proverb, but unfortunately the average home cannot afford the space for a conventional safe in which to keep jewellery, money, securities, and so forth. For this reason the novel safe which has recently been placed upon the market should command attention. It is of the size of an ordinary brick, and the idea is to let it into the wall. It can be placed wherever desired, and for greater security

may be fitted behind a picture, a piece of furniture, or a door, where its presence is not likely to be detected. The safe is made of steel, and is provided with a door of the best hardened steel, furnished with a six-lever Yale-type lock, so that no two locks are alike. Moreover, there is a secret device whereby the keyhole is rendered almost invisible. The method of fixing the safe is extremely simple. It is only necessary to remove a brick from the wall, and the safe will slip into the cavity thus formed in such a manner that the door comes flush with the external surface. The safe is fixed in special cement, which when set becomes extremely hard, so that if forcible removal of the safe is attempted the wall must suffer considerable damage. If desired, the upper and bottom plates of the steel box-like device may be provided with lugs, which, entering the joints of the bricks above and below the cavity, contribute to greater security. But, generally speaking, these lugs are unnecessary, the cement being adequate to seal the safe into the wall. Home safes of this type have a great vogue in the United States, the fact that they can be placed in any position and are capable of being outwardly concealed rendering the nefarious work of the burglar less profitable.

ELECTRO-PLATING WITH COBALT.

A recent discovery, which cannot fail to exercise appreciable influence upon the electro-plating industry, has recently been completed in Canada and subjected to commercial test. This is electro-plating with cobalt instead of with nickel. The results are stated to have been most surprising. As is well known, the North American Dominion is extremely rich in cobalt deposits, the most productive veins being found in the Lake Temiskaming country, the town of Cobalt, in fact, having risen upon the scene of the first discoveries. The solutions of cobalt were prepared especially for the purpose, and consisted of a mixture of cobalt sulphate, common salt, and boric acid. With a critical solution, determined from experiment, a splendid white hard surface was obtained; while the deposit was stated to be perfect. The articles which were plated in this manner, and of which particulars have been furnished, included thin embossed brass stampings and the plated parts of automobiles. The stampings were immersed in the cobalt solution for one minute, and then handed to a buffer, who was ignorant of the fact that they had been electro-plated with this metal instead of with the usual nickel. The ten-inch cotton buff-wheel made three thousand revolutions per minute, and a perfect finish was obtained, free from exposed edges. The stampings were plated in two-dozen lots, and out of a trial batch of five hundred only three were rejected as imperfect after buffing. Gray iron castings carrying raised

designs were also immersed in the bath for a minute, and then subjected to burnishing with four hundred pounds of one-eighth of an inch steel balls for a quarter of an hour. Examination revealed that the cobalt plating had not suffered the slightest injury, this fact being completely proved by immersing the test pieces for thirty-six hours in a one-part-to-fifteen sulphuric acid bath. The company which has adopted the cobalt plating system pronounces its entire satisfaction with the results achieved, the plated article when polished having the rich bluish bloom characteristic of the metal. It is stated to be cheaper than nickel; while the process, when carried out upon a sufficiently comprehensive scale, is not only quicker, but enables a 75 per cent. saving in labour to be effected. Hitherto the uses for cobalt have been somewhat limited, but new applications are being discovered with increased activity in scientific investigation. It was only a short while ago that we referred to the discovery of cobalt-steel, and this latest development will open up another and highly profitable field for the metal.

THE INFLUENCE OF SMOKE UPON CANCER.

One of the most interesting contributions to the eternal problem of cancer is the book which has been written by Mr C. E. Green. This volume approaches the subject from an entirely new direction, being in reality an investigation into the geographical distribution of the malady, and into the influence of manufacturing industries and dwelling-houses upon its virulence and development. According to this work, it is apparent that coal-smoke is one of the causes contributing most to the malignancy of the disease. The author emphasises the point that where chimneys abound cancer is always to be found; while it is most prevalent of all in those districts where the chimneys have a poor draught owing to overtowering surrounding structures, a state of things frequently occurring in the streets of small houses which one finds in all our busy industrial centres. On the other hand, if the chimneys draw well, if the situation of the house is favourable, and if the coal burned is consumed with a fair degree of completeness, then the prevalence of the malady falls. From consideration of these facts, Mr Green advances the conclusion that it is the sulphur contained in the coal which is an important factor in the disease. He is confirmed in this opinion as a result of his investigations in the peat-burning districts, where cancer is almost unknown, the highest death-rate in these being at one place where the fuel is rich in sulphur content. The cancer problem is one of the most acute of those confronting us to-day, and one can only conclude from a perusal of this volume that in the effort to cope with this dread enemy we must first overhaul our antiquated methods of

burning coal both in our homes and in our industrial establishments, so as to secure such efficient combustion of the fuel as will ensure the elimination of smoke from the atmosphere, more particularly in congested areas.

A SAFETY POTATO-PEELER.

A novel use for discarded safety-razor blades should appeal to the housewife. The edge of the blade, when it becomes too dull for its original purpose, is still sufficiently sharp for other less delicate duties, such as the peeling of potatoes and apples. But the blade, owing to its thinness and pliability, requires a firm support, and this is offered in the new peeler. In general appearance it resembles a stumpy knife, its apparent blade serving as a guard for the razor-blade. When the latter is slipped into position and brought into service it has the same relation to the surface of the potato or apple as it had to the face when serving as a safety-razor. The blade being very thin, only a thin paring is removed, thus effecting a considerable saving. The implement is safer to use than the ordinary knife, because the mounting, acting as a guard, preserves the fingers from being cut.

A SAFE LAMP FOR KINEMATOGRAPH PROJECTORS.

For some time past efforts have been made to produce a safe system of illumination for kinematograph projectors, and it is only recently that success in that direction has been achieved. There is now no need to employ the naked arc light, even when the brightest illumination is demanded, since a new incandescent electric lamp of high illuminating power has been placed upon the market. The lamp, which is of one hundred candle-power, is of the tungsten type, and its suitability for kinema projection may be realised when it is explained that the illumination, instead of emanating from a loop of filament, as in the ordinary incandescent light, issues from a small ball of tungsten which is placed in the centre of the bulb. Beneath this ball is the ionising filament, consisting of a thin horizontal strand of tungsten, adequately supported; and the light-ball, when the arc is struck, is instantly moved by an automatic bimetallic support to a different position, thus slightly lengthening the arc. The arrangement causes an extreme concentration of light, thus ensuring the most accurate focussing of the lamp in relation to the lens and the reflector, so that a uniformly illuminated disc is thrown upon the screen. The lamp is carried in the conventional type of bayonet holder, and can be attached to any convenient point upon the lighting circuit, such as a flexible arm or bracket. The outfit consists of lamp, adapter, resistance-box, resistance-plug, supply-plug, switch, and push-switch. When the light is desired, the push-plug is pressed for two or three seconds, thereby energising the ionising filament. The push is then

released, and the arc is struck between the ionising filament and the tungsten ball. With this lamp the lantern can be kept cool, so that there is a very appreciably reduced risk of the film being fired, even if it is left in the open gate. It virtually eliminates the necessity of housing the projecting apparatus within a special steel box. The light thrown from this lamp is very similar to daylight, and by its aid the pictures projected upon the screen can be given a perfect uniform brilliancy to the extreme edges.

THE HAND-DRY DISH-WASHER.

A labour-saving device which will appeal to the housewife is the hand-dry dish-washer which has been placed upon the market. As its name implies, it offers a means of performing a necessary household duty with the minimum of discomfort and injury to the hands, even when the hottest water is used. It consists of a little mop or swab mounted in the head of a small drum attached to a short handle. This head really constitutes a small cylindrically shaped chamber, the lower end of which is freely perforated with holes. From the upper part of this chamber extends a short length of flexible india-rubber tubing, the end of which terminates in a small attachment which slips over the orifice of a tap, and is held firmly in this position by means of a short chain. When the tap is turned on, the water flowing through the india-rubber tubing enters the chamber already mentioned, and escaping through the perforated holes, passes through the mop. The handle is of sufficient length to enable the washer to be employed with fairly deep bowls, and when dishes are being cleansed there is no need whatever to touch them, and the hand may be kept out of the water. The washer need not be detached from the tap when the dish-washing operation is completed, but may be left hanging ready for use. Should it be necessary to remove it, the release of the chain achieves this end. Water cannot escape at the point of attachment, because an effective seal is provided in the form of a substantial india-rubber ring. If, during the task, it is desirable to change the water, the vessel may be emptied, and then recharged merely by leaving the washer lying in the empty bowl and turning on the water. Being of simple design and strong construction, there is little danger of the washer failing in its duty; while it is so made that the chamber to which the mop is attached may be readily unscrewed to permit of the interior being cleaned.

EVADING ELECTRIC 'LIVE-WIRE' FENCES.

Considerable prominence has been given to the precautionary measures which the Germans have employed to prevent the escape of prisoners from internment camps and across the frontier. A wire fence is erected, and this is connected

up to an electrical circuit, the result being that the fence is kept constantly 'alive.' Consequently, should any one attempt to escape in the usual manner, he would court certain death from electrocution. The fences are charged with current at a high pressure, and to prevent accidental contact by friends and soldiers performing guard-duty, the 'live' fence is protected on each side by another fence of barbed wire, placed some distance from the 'barrier.' By the introduction of these measures the Germans have found it possible to reduce the number of sentries along the frontier. But the Belgians, according to report, regard the 'electrocuting fence' with disdain, having discovered a simple and effective means of evading the menace when they wish to escape into Holland. An ordinary iron-hooped barrel is rolled towards the fence, and after the protective barbed-wire entanglement has been negotiated the man crawls into the barrel, which is laid upon its side. He then rolls it towards the 'live' guard, imparting the necessary rolling motion in much the same manner as a squirrel or a dormouse rotates its cage. When the barrel reaches the fence, the iron hoops binding the staves together establish a contact and set up a 'dead earth.' The person within the barrel is perfectly secure, and consequently rolls himself under the fence without running the slightest danger, and with practically no inconvenience, the horizontal wires of the fence passing readily over the curved contour of the barrel, and a perfect short circuit being maintained until the opposite side of the barrier is gained.

STONES AS MONEY.

In their annual bullion report, which has been recently issued, Messrs Samuel Montagu and Co., says the *London Standard*, mention that in the island of Yap, one of the Caroline Islands, which passed by purchase from Spanish to German sovereignty after the Spanish-American war, and have now passed by capture into the possession of Great Britain, stone money called *fei* is used as a medium of exchange in addition to the ordinary shell-money. It consists of large, solid, thick stone wheels, ranging in diameter from one to twelve feet, and having a central hole through which a pole can be inserted. These stones are all quarried in the Pelew Islands, about two hundred miles south, and are brought to the Carolines by boat. The largest of them weigh as much as five tons. The value represented by a stone is naturally proportionate to its size. The limestone of which the *fei* is composed must be of fine white grain to be considered good delivery. Yet there seems to be no real necessity for delivery at all, for it is quite customary to earmark the money, as it were, and leave it in its old position outside the first owner's hut—an excellent provision, considering the bulkiness of the material. The

owner for the time being possesses power to wield the influence which attaches to this visible display of wealth. Messrs Samuel Montagu and Co. also mention a number of countries which have had to find a substitute for the metals ordinarily used in their currency. Owing to the difficulty of providing small change quickly enough in war-time, the Russian Government has printed the designs of the ten, fifteen, and twenty kopeck denominations of the Romanoff Jubilee postage-stamp issue upon thick paper, and, by lettering upon the reverse side, has authorised them to be used as currency, with the same legal tender as silver subsidiary money. Iron money was put into circulation in Germany from 1st October last, when one hundred million five-pfennige pieces were issued. In Mexico, during the military struggle for the presidency of the republic, various expedients had to be adopted. Tramway-car tickets were used for small change, and cardboard money, about one inch by two, was issued by different leaders in the struggle.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE WISH.

I WANDER through the fields where once we wandered,

I linger where the stream flows softly by;
And, 'mid the scenes her presence so transfigured,
Again I find her nigh.

The murmuring music of the rippling water,
The sigh of worship in the bending corn,
The zephyr's mystic whispering in the branches—
On each her voice is borne.

And then there wakes a deep, heart-piercing longing:

Oh that I had her as a child again!
To fold her to my heart as then I held her!
Ah! hopeless wish, and vain!

Yet no! Not vain in its true inward craving
The spirit of this dumbly uttered prayer;
Let Him but shield her from the world's contagion,
My cry is answered there.

The wondrous crown of womanhood already
Begins to press that brow so calm, so mild;
But in her breast the heart I love so dearly
Is still that of a child.

I wander through the fields where once we wandered,

I linger where the stream flows softly by;
And then I lift my heart in loving worship
To Him who brought her nigh.

Blessed be God, who in the past thus brought her!
Blessed be God, she still is mine to-day!
Blessed be God! In His hand lies our future!
We rest in Him for aye.

A. CHARLES HAMILTON.

Chambers's Journal

SEVENTH SERIES

THE WHITE FLAGS OF SAN SALVADOR.

By the Rev. ALFRED PENNY.

CHAPTER I.

THE sun, that had only just set on the battle-fields of France and Flanders, was rising above the waters of the western Pacific and shining upon a large island, which we may call San Salvador, though that is not its name on the ocean chart.

Along the shore, as far as eye could see, there was a strip of yellow sand. It was edged on one side by a fringe of white foam, for the tide was coming in, and on the other by a dense belt of coco-nut palms. Bordering the line of the coast, and spreading inland for miles and miles, was a vast forest, which extended in an unbroken expanse of dark-green foliage till the shapes of the trees were lost among rocks and scoræ. And this rough ground led up to a mountain range that appeared to form a hog's-back to the island and an impenetrable barrier to any country on its opposite side. There were giant peaks in this ridge, and valleys deep in shadow; and where the mountain chain began and where it ended was lost in the hazy brightness of the morning sky.

Clusters of huts, and here and there the trim-built bungalow of a white settler, dotted the beach; and a collection of large sheds and houses, some native-built, some English, were grouped at the head of a snug bay. Over the largest of these structures the Union-Jack floated—the settlement was a British coaling station, and a big man-of-war cruiser had just dropped anchor near the shore.

In a cabin at the stern of the ship two men were studying a chart. One was the captain, and the other was evidently a visitor, his dress looking as if he had come off to the ship in haste. His flannel jacket had once been the light blue of the Cambridge 'Eight,' and parts of the old 'blazer' showed a faint tinge of its original hue; but from age and exposure to the sun the colour had faded, and it almost matched that of the companion trousers, which from frequent and unskilful washing were more yellow than white.

The captain looked up from the chart on which he was tracing a short pencil-line; it cut straight across the mountain range of the island called San Salvador.

'And so you think, Mr Heriot,' he said, 'that the Germans might use this pass to surprise our coaling station?'

'Indeed I do, sir,' Heriot answered, 'provided they can find the entrance to it on the other side of the island.'

'But I don't see how they are likely to do that,' the captain said. 'They don't even know that there is such a pass; it is not marked on any chart; no other white man but yourself has been through it; and the natives, you say, would never tell the secret of it to the Germans.'

'I'm positive of that,' said Heriot emphatically.

'But if it is such a mystery, how did you get to know about it yourself?'

'I went to visit the people who live on the other side of the island,' Heriot began, 'and while I was there the chief fell ill. The native doctors could not cure him, so his friends sent for me.'

'You fellows at the mission station know a bit about medicine, I suppose,' the captain remarked.

Heriot laughed. 'This was faith-healing,' he said.

'What!' the other exclaimed.

'I don't know what else to call it,' Heriot answered. 'I've just described the case to your doctor, and he said he wondered I didn't kill the chief on the spot. I gave him, he declared, quite the wrong stuff.'

'But he got well.'

'I should think he did! The day after he took my medicine he said publicly that he was as well as ever he was in all his life. His people loaded me and my party with presents.'

'Then the secret of the mountain pass was part of your fee?'

'Not quite that. When I was going away Takua—that's the chief's name—begged me to come and see him again; but I said I couldn't promise to do that, as the journey across the island was too long and too rough. We had to make our way through the forest and traverse a shoulder of the mountains. It took us six days. Well, Takua did not like this, but he knew that what I had said about the journey was true. So he went back to his people, and

they had a long palaver together. Then he came to me again, and said that if I would promise to come when he sent for me, he would show me a track through the mountain range by which I could cross the island in a day's march.'

'He wanted to have his doctor handy,' said the captain with a grin.

'Takua made only one stipulation,' Heriot continued. 'We must set out early in the morning so as to get over a certain part of the journey before sunset. We had to pass through a defile, he explained, where rival chiefs used to ambush one another's fighting-men, and where the ghosts of these defunct warriors still appear to reside and kill any one they can catch after dark. This danger, Takua assured me, is especially great when the moon is full, so we had to wait till the moon was in the last quarter before starting on our journey.'

'I thought ghosts could see in the dark,' the captain said.

'So did I,' said Heriot, 'but apparently the San Salvador ghosts are exceptions to this rule. They can kill a man at this spot in the dark if they happen to barge into him or if he collides with them by accident; but give them a bright moonlight night, when they can see their enemies and at the same time keep hidden themselves, and a whole army of soldiers, Takua assured me, wouldn't have a chance against them. They can ambush an enemy now just as effectually as they could when they were alive.'

'How the devil do they do it?' the captain cried, laughing heartily.

'They rise from the river after sunset, Takua told me, and they take the form of white films of mist which are only visible on moonlight nights. They float about, and wave and flutter, he said, just like the signal-flags that he has seen on a man-of-war. And if any one is benighted in that pass they go for him, and settle on his head, and he is at once seized with fever and ague, and dies promptly.'

'Has any one seen these white flags of San Salvador and lived to tell the tale?' the captain asked.

'I don't know,' Heriot answered, 'but I hadn't a chance of seeing them. We started so early in the morning, and pushed on so fast—Takua, who accompanied me, would not even let me stop to make a sketch of what he calls the Valley of the White Flags—that we reached this side of the island before sunset. That's how I had the bad luck to fall in with Schneider. He was coming back from a visit to the coaling station.'

'Who the deuce is Schneider,' the captain asked, 'and why was it unlucky to meet him?'

'Schneider is a German and the manager of the coco-nut plantation down the coast. He suspects that I have discovered a short cut across the island.'

'The deuce he does!' said the captain, and he

made a remark under his breath indicative of a wish to deal finally with Germans in general. Then he said aloud, 'But Schneider hasn't been through this pass?'

'No—no,' said Heriot. 'But by a bit of bad luck he stumbled on me and my party just as we were wading out of the mouth of a little river that leads to it. His dog, which has taken a great fancy to me, spotted where I was hiding from him. Of course, Schneider saw by my men and my traps that we were returning from a journey, and he knew I had been away from the mission station, so he wanted to know where we had come from and why we were wading down that stream. Every one here knows that it must rise somewhere among the mountains, but no one cares to explore it. The natives say that it is haunted by ghosts, and they won't go near it.'

'They know it's a guide to your mountain pass,' the captain remarked.

'Just so; but I wasn't such a fool as to tell Schneider that, though there was no thought of war with Germany then. Oddly enough, some relative of his is governess to my sisters in England, and Schneider and his wife are always trying to presume upon this, and to worm themselves into my confidence; but I don't like the fellow, and I don't care to be chummy with him.'

The captain nodded his approval of Heriot's attitude toward his German neighbours, and lighted a cigarette.

'I was the more determined not to tell Schneider about this pass,' Heriot went on, 'because I saw he was keen to find out what he could about it. He sent his wife to the mission station to pump my boys.'

'Did she get anything out of them?'

'Not what she wanted to know. This was if there are any landmarks to the approach to the pass on the other side of the island.'

'They didn't tell her what you've told me—about the Pig's Head Rock and the waterfall?'

'They don't know these clues themselves, for they did not go with me to the other side of the island, and the men who did were at work in their gardens when Frau Schneider came spying. Not that they would have told her anything worth knowing if she had seen them. The natives hate the Schneiders.'

'Why?' the captain asked.

'Don't you remember the case of a manager of a plantation on one of these islands being tried for killing a black man in his employ?'

The captain shook his head. 'It must have been before my time on the Australian Station,' he said.

'Well, that man was Schneider,' Heriot continued. 'He was acquitted at his trial, but the natives say he was guilty. And if he were, even now, to go to the other side of the island,

where the murdered man came from, his life wouldn't be worth that; and Heriot snapped his fingers.

'This is getting interesting,' said the captain. 'Then Schneider would not care to wade up that stream, down which he caught you coming, cross the mountains by your pass, and see for himself where it comes out on the opposite shore?'

'I should think he would as soon set out of his own free-will to explore the brink of the bottomless pit!' Heriot answered.

'Then we may dismiss Schneider as a source of danger,' said the captain. 'What man-of-war, do you think, would land men on an unknown shore, to look for the mouth of a suspected but uncharted pass, to cross an unexplored range of mountains, and to attack an enemy somewhere on the other side? It was quite right of you to report this discovery to me, and give me this warning; but your fears are groundless unless you have some further cause of apprehension.' And the captain relighted his cigarette, which had gone out, and pushed the box across the table to his guest.

'But I haven't told you yet why I am chiefly anxious about Schneider,' Heriot said hesitatingly, and without helping himself from the cigarette-box. 'I've written home, and I've told my father everything I've told you. He likes to hear about all my doings. I even drew a sketch for him of the entrance to the pass, showing the clues to it—the Pig's Head Rock and the waterfall. It would be as easy as rolling off a log to spot the place from a ship with this rough chart, or even with a description of it. I've given the whole show away, sir,' Heriot cried excitedly.

'But surely your father would not show your letter or even talk about it to any stranger at a time like this!' the captain said gravely.

'No—no,' Heriot cried. 'He never would do that. But'—

'For Heaven's sake, man, get those butts off your chest!' the captain said sharply. 'What the devil are you worrying about now?'

'I told you that my people have got a German governess,' Heriot answered rapidly, 'and that she is some relation of Schneider's. They correspond, and Schneider may have written to her by the same mail and told her to get at my letter. The governor would pack her off to her own country at the outbreak of war; but'—

'When did you write?' the captain interrupted.

'The end of July.'

'And when would the letter reach England?'

'The end of this month.'

'About now, in fact?'

'Three or four days ago if the mail were on time.'

'I'll send a wireless to Sydney,' the captain said promptly, 'and the message shall be cabled

to England. You shall telegraph to your father and tell him to destroy that letter at once.'

'What shall I say?'

'"Destroy letter," and sign it "Heriot."'

'May I use our own code? No one but my father would be able to read the message then.'

'In that case you need not sign it. But have you got the key with you?'

'Yes, here;' and Heriot opened the back of his wrist-watch and showed a circular piece of paper fitted into the lid. It was covered with letters and figures.

'Then code it right away,' said the captain.

At that moment there came a knock at the cabin door, and an officer appeared and said, 'A wireless just received from Sydney, sir;' and he handed a piece of paper to the captain. 'But it's not in our code, and we can't read it.'

'I believe it's my code,' Heriot cried in amazement, as he studied the figures the captain showed to him.

'De-code it, then, and look sharp,' the captain said.

This was soon done, though Heriot's wrist shook so violently that he could hardly read the key to the cipher, and the following message appeared: 'Letter—stolen—beware—Schneider.'

'Send a boat on shore, Mr Jackson,' the captain ordered, 'and bring that German planter off to the ship. Search his house, and bring all the letters and papers you find there.'

'He is gone, sir,' said the officer.

'Gone!' the captain exclaimed. 'How do you know that?'

'Schneider's Chinese bailiff is on board, sir. He is waiting to see you. He says his boss bolted last night. He went off after dark in his motor-boat.'

CHAPTER II.

THE news of Schneider's flight, following Heriot's cable, made a transformation in Captain Parvis, for this was the captain's name; he dismissed his airy manner and smiling expression as a quick-change artist flings off a disguise.

'My compliments to Captain Barr,' he said, and there was a new ring in his voice as he spoke to the officer of the watch, 'and tell him I wish to see him at once.' Then, pending the coming of the commander, he turned to Heriot. 'Tell me this,' he said shortly. 'I want a couple of scouts to cross the island by your pass and bring me back word if a German man-of-war approaches the opposite shore. Have you any natives you can trust to do this?'

'Yes, sir,' Heriot answered; 'but I'll go myself if you wish.'

'No; I want you for another purpose. I shall send a force to guard the pass, and I shall require your services as guide.'

'The bush track leading to the pass is not easy to find,' Heriot demurred, 'and I've only been along it once. The natives who accompanied me are far more reliable guides than I should be. A native is sharper than a white man in finding his way through the bush.'

'That sense has been civilised out of us,' said the commander, who had just entered the cabin.

The captain nodded. 'But I won't trust to their Pidgin-English,' he said. 'You will go with the expedition as interpreter?'

'Willingly, sir.'

'Then that's settled,' said the captain conclusively. 'And now we'll go back to the scouts. They must start without a moment's delay; but I must see them myself and give them their orders. The guides also must come on board as soon as you can find them, to be ready to land with the expeditionary force. I'll send you on shore now.' And the captain rang his bell.

'Hold on, sir,' said Heriot. 'The four men I was thinking of are my boat's crew. They are alongside the man-of-war in my whaler.'

The commander smiled approvingly, and the captain's voice was less emphatic. 'But will your scouts go through that pass?' he asked. 'Won't they be afraid of the ghosts?'

'They know better,' said Heriot. 'Besides, they will have time to get through the haunted valley before dark.'

'Ah! you're hedging,' said the commander, smiling. 'But it won't be dark to-night, remember that; the moon will be full to-morrow.'

'So much the worse for them,' the captain remarked grimly, though there was a twinkle in his eye. 'But you haven't heard of the white flags of San Salvador,' he said, addressing the commander. 'Perhaps you'll see them, as you'll command the expeditionary force.'

'What the'—— the commander began.

'No time for talking,' said the captain.—'And you really mean,' he went on to Heriot, 'that I can trust these fellows to cross the island and come back again—by day or by night—ghosts or no ghosts—and give me warning if the Germans land?'

'They can do better than that, sir,' said Heriot. 'They can tell Takua to liberate our pigeons'——

'Do you mean that you have birds there which will fly back with a message?'

'Takua took some of our tame pigeons when he returned to his country after leading me through the pass,' said Heriot. 'He said if he

were suddenly taken ill he should loose the birds to call me to his bedside.'

'Good!' the captain exclaimed. And then, turning to the commander, he said, 'You didn't know, Barr, that your friend Heriot is a famous doctor as well as a missionary, and that his patients give him anything he wants!—Now, doctor,' he said good-humouredly, 'go and tell your boat's crew to come on deck at once.'

As the scouts had a rooted conviction that if the Germans landed on their shores they and all their friends would share the fate of Schneider's employé, they were keen to co-operate with the man-of-war in trying to avert this catastrophe. Being also entrusted with a liberal present for Takua, they were sure of a friendly reception in his country, a favour not always accorded to visitors at San Salvador; and as they were to be well paid for their services, the business instinct of the South Sea Islander, still in them despite their Christian education, was fully satisfied. Thus it came about that the scouts started on their mission in high spirits at the prospect before them; while their two comrades were equally content to remain on board the man-of-war—food and tobacco all found—till their services were required as guides.

'And now, Heriot,' the captain said when the three men had returned to the cabin, 'will you describe the mountain pass to Captain Barr? Tell him the whole yarn as you told it to me.'

When Heriot had done this he was closely questioned upon the details of his story, especially concerning the old ambush that Takua called the Valley of the White Flags. The commander drew a rough plan of the place from Heriot's description of it, and the captain made some notes of its situation. 'Not more than ten miles from the coaling station,' he jotted down on the sketch. 'Our men might reach it in three or four hours; but a force starting from the opposite side of the island would have to march at least twenty miles, and they would have rough ground and stiff climbing. It would take them ten or twelve hours to get there.'

As to the strategical value of this valley, Heriot could only give his own unprofessional opinion; but what he said was this: that if two hostile forces were approaching each other along the pass he had described, the one which got last into the Valley of the White Flags would find itself in as ugly a death-trap as any soldiers or sailors had ever been in since land or sea fighting began.

(Continued on page 234.)

A BUILDER OF EMPIRE: SAMUEL MARSDEN.

By JOSEPH MEDE.

CHRISTMAS DAY 1814 marked an anniversary notable not only in New Zealand, where it was celebrated, but only less notable as an event in the building up of the Empire. On that same day one hundred years before, the Reverend Samuel Marsden, a Methodist who was also a priest of the Church of England, held the first Christian service and delivered the first Christian message to the then heathen of New Zealand. They were chiefly known to the white man as a ferocious and savage people who not infrequently killed and ate sailors who reached the inhospitable shores of New Zealand.

Only five years before Mr Marsden landed, the British ship *Boyd* was wrecked on the New Zealand coast, and the Maoris, in revenge for the flogging of a chief, killed and ate the captain, officers, and crew to the number of seventy. It was an act of audacious bravery on the part of Mr Marsden to select for the scene of his arrival and for the proclamation of his news the very spot where this murder and cannibalism took place. He arrived a few days before Christmas at the Bay of Islands, and at once landed, to be greeted warmly and affectionately by the natives, some of whom had made his acquaintance on visits to Sydney, where he was always the protector of the Maoris. He had taught them to make the parsonage at Parramatta, New South Wales, their shelter from the whites in Botany Bay. Notwithstanding this *mana* which had preceded him, there must have been a great danger of treachery and reprisals for cruelties from the Maoris; yet Marsden took the entire risk in his hands. Though he did not think it safe for the women and children he had brought to come on shore, he himself landed, and slept all night amongst the natives, side by side with the chief who had directed the massacre of the *Boyd's* crew. Hundreds of Maori warriors lay around, many of them the actual perpetrators of the destruction of the vessel's crew; yet Marsden trusted them, and spent that night on the hillside among them in quiet sleep. It was the supreme way to impress these people. Brave themselves, they admired bravery. Around were innumerable spears stuck upright in the ground, groups of natives lying about in all directions, cannibals who had massacred and devoured Marsden's countrymen. One is not surprised to learn that Marsden woke early in the morning, when he found the savage warriors still sleeping, rolled in their mats. Some will remember the picture of the last sleep of Savonarola. Another great painter has an equally memorable scene yet to depict—the apostle of New Zealand sleeping amidst the cannibals.

After spending a couple of days at the site of the *Boyd* massacre, the *Active* proceeded on her journey, and on Christmas Eve reached her farther destination in the Bay of Islands. Here there was a great gathering of natives, assembled by a chief named Ruatara, under whose directions the Saturday was spent in preparation, Christmas Day 1814 being a Sunday.

The story of Marsden in New Zealand cannot be told apart from that of the chief Ruatara, whom Marsden had befriended. Ruatara made great preparations for carrying out the ideas which he had got in Australia. He hoisted the British flag, dressed himself in regimentals which the Governor of Botany Bay had given him, and with two other chiefs assembled all their warriors. He prepared an enclosure of an acre, into which the tribes were marched, the women and children forming a circle around. Marsden relates that a very solemn silence prevailed, the sight being truly impressive. He began the service with the singing of the One Hundredth Psalm, which ought to be the national hymn of New Zealand. He read the Church of England service, which of course was incomprehensible to the natives, with few exceptions. One of the chiefs by signals indicated to the people the movements of standing and sitting as the service proceeded. Mr Marsden took for his text, 'Behold, I bring you good tidings of great joy,' Ruatara explaining the sermon to his countrymen.

Thus was begun a work which meant that Marsden gave New Zealand to the New Zealanders of to-day. He was its real founder, and it is not till the holding of this most memorable service that the history of New Zealand begins. Previously the authorities at Botany Bay had never regarded New Zealand as possible even for a convict settlement, because amongst those who hanged and flogged men with a brutality impossible for us of to-day to understand, the risk of being eaten seemed too certain and severe a punishment even for the worst of criminals. But Marsden made it possible for New Zealand to become what it is now—an integral part of the Empire, and the happy and pleasant home of a million civilised people. Marsden brought with him a veritable Noah's Ark, his ship carrying a few white men, with their wives and children, the men being artisans intended to teach the natives what were then called the 'arts of life,' or, as we should call them, industries. In his little boat of one hundred and ten tons, like Noah of old, he had animals of various sorts, horses and cows and sheep and pigs. Every pound of wool grown in New Zealand since, which has added

to its wealth, is the indirect product of Marsden's enterprise. The annual export of butter and cheese from New Zealand now approaches three million pounds sterling in value, all of which is the outcome of Marsden's foresight. New Zealand has become a great horse-breeding and racing country; he could hardly have contemplated the latter, but that it is possible to have such fine horses is due to Marsden. The printing-press—source of all information nowadays—was likewise introduced by him. Only the other day I was told of some of the type being found which Marsden sent to New Zealand.

But while Marsden believed in the 'arts of life,' he did not look to them as the only or real means of civilising the cannibal savages. He was a firm believer in the power of the Gospel. His missionaries, though artisans, were by their lives to teach the natives, and soon were strengthened by the addition of trained teachers, whose work was aided as quickly as possible by printed selections of the Christian Scriptures, which the cannibals 'eagerly devoured,' but in a sense different from that in which they had 'eagerly devoured' white voyagers stranded on their shores. It is related that the natives were so eager to read the Scriptures that they learned to read English print upside-down, an accomplishment arising from the circumstance that a man with a solitary copy of the printed Scripture selections would sit in the middle of a group, the natives sitting around him in a circle, and, following his finger as he read, they learned with such avidity that soon they were able to read, no matter in what position the printed portion lay. The Church of England service seemed to have some special fascination for the natives, who learned it by heart, and carried it into remote parts. When white missionaries or travellers reached tribes who had never seen a white man, they found the natives greeting them with portions of the Prayer-Book, and able to join in the service without any books to help them.

Marsden's duties in New South Wales prevented his remaining in New Zealand altogether, but he paid no less than seven visits to foster the work which he maintained so long as he lived.

Were the authors of the *Acta Sanctorum* writing the story of Marsden's life, they would find more scope for miracles than some of the incidents recorded as miracles, or developed into miracles, in the lives of the saints of mediæval days. Marsden began life as a blacksmith and farmer's son in Yorkshire; he was no scholar, and yet he became a man of affairs, an adviser of statesmen, a builder of Empire, a conqueror of cannibals, an inspirer of the missionary zeal of to-day, and perhaps more than any other individual left his imprint on the future of Australasia. The founder of sheep-breeding in New Zealand, he also encouraged it in Australia, taking thither five Spanish sheep presented to him

by King George III. He lived in a period which seems the blackest page in British history—of cruelty, barbarous and indescribable, to our own white brothers and sisters, no less than our cruelty to the native races whom we touched. He saw religion and morality, which were at their lowest ebb in the Motherland, reach still lower depths under new conditions in Australia. Through all he remained true to his principles and his Christian convictions, against governors, military authorities, and public opinion generally. At one time he was suspended by the governor from exercising his functions at Botany Bay. At another time he was forbidden by the governor (Macquarie) to leave Botany Bay to visit New Zealand. On visiting England, he had great difficulty in persuading the supporters of missions that it was possible to do anything for the savages of New Zealand. Yet he overcame all these difficulties. Though helped subsequently by small grants from the Church of England Missionary Society, he provided from his own resources the chief expense of his New Zealand projects. When the Government refused him permission to depart and the means of transport, he provided a ship at his own expense.

His courage has been indicated already, but that was by no means an isolated incident. On another occasion two tribes were fighting out a long feud, and Marsden found his way into the middle of the fight between the two tribes, and by his mere presence stopped the fight, and succeeded in finally ending it, an almost unheard-of thing amongst the Maoris, with whom *utu* (or revenge) was a religion. How would not the authors of *The Lives of the Saints* have developed this into a miracle—the solitary figure standing between two tribes with their spears raised, men falling, and peace triumphant at a word! No less would they have found a miracle in likeness to that of the five loaves and fishes in the fields of wheat which sprang from the first handful Marsden sowed. The bread eaten to-day is baked because of the flour which was ground in the first mill which Marsden brought. He literally gave to the Maoris bread for the body simultaneously with bread for the soul.

Marsden's moral conquest of Ruatara is a story worthy in itself, and one which is quite as miraculous as any of the events of earlier days. Ruatara was a young chief of a notable tribe, stirred, like Peter the Great of Russia, by the stories he heard from casual voyagers—possibly some of those who were eaten—of the wonders of the civilised world. Ruatara decided to go abroad that he might learn those things which would lift up his tribe and race. Sailing in a whaler, he found his way first to Sydney, where it is very probable he made Marsden's acquaintance. Ruatara was nephew of a greater chief, Hongi, who had seen a great deal of

Marsden, and stayed with him for long periods on several occasions in Sydney. Ruatara took passage from Sydney to England with the promise from the sailing-master of seeing the king and acquiring much knowledge which would be of use to him; but he was cast adrift in London by the English skipper, who had no further use for him, though he had worked his way before the mast. By one of those coincidences which some would call strange, but in which others see the hand of Providence, Marsden was returning from his only visit to England in a ship named the *Ann*, and when he had been some days on board he found a wretched native who had been thrown down into the hold after being brutally and severely flogged. Commiserating with the native, he found him to be Ruatara. Marsden, like the good Samaritan of old, bound up the wounds of the chief, and, still more, poured the oil divine of human sympathy upon his heart-breaking disappointments; then, setting him on a level with himself, brought him into a more proper relation with his surroundings. Ruatara came with Marsden to Sydney, and again set sail for his own country. Once more the white men treated him badly, breaking faith with him, carrying him past his own shores within sight of his home, and finally stranding him at Norfolk Island.

Again Ruatara comes to Sydney, once more sees his friend, who again binds a broken heart, and Ruatara leaves for New Zealand. He reaches his own people, and forgets the wrongs and indignities which he had endured at the hands of the civilised white man. He remembers only the influence of Marsden, tells his people of him, and bids them look for his coming. When, in due time, Marsden arrives, he is eagerly welcomed by the one-time cannibal savages, under Ruatara's guidance. Here is a miracle of grace—the savage chief forgiving his enemies as the first-fruits of Marsden's work.

But the saddest part has yet to be related. Wrecked, as Ruatara was, by physical suffering inflicted on him by the 'superior' white man, and his proud heart broken by these indignities, Marsden's first arrival in New Zealand finds his friend and patron at the early age of twenty-four or twenty-five a dying man. Marsden ministers to him; and soon after his departure Ruatara's soul fled; and the vision which he had dreamed of great towns in his country remained to be realised, but not seen by him with earthly eyes. In the history of the foundation of New Zealand Marsden's name should be linked with that of Ruatara; yet New Zealand has no monument for either. Politicians who have served their country at handsome salaries have their statues and monuments erected from the public revenue in places of honour. Of Marsden and Ruatara the only memorial is a cross raised on the site where the

first service was held, provided at the expense of a few Christian people; but nothing from the public in its capacity as a state reminds the New Zealander of to-day of those to whom above all others he owes his existence in this country.

The hundred years since then have seen marvellous progress. The whole world has seen much change and advance; but it is doubtful whether any place has seen as much improvement and prosperity as New Zealand, its savage cannibalism changed to peaceful civilisation, and the Maori living side by side with the *Pakeha*. The Maoris were not merely conquered by force of arms; sometimes, indeed, they defeated the troops sent against them even when they numbered ten thousand. An important factor was the power of the Gospel, which subdued the Maori, taught him to whom *utu* had been a religion to be forgiving, gentle, and peaceable. He absorbed the message of Christianity as a child absorbs its mother's milk, and as eagerly, proving himself capable of living up to its highest precepts, and putting them into practice even when the troops, in their battles with the Maoris, neglected them. There would have been only one other way of settling a white race in New Zealand, and that would have been by a complete extermination of the native race; yet, thanks to the Christian religion implanted in their minds by Marsden and his successors, there was never any necessity for this.

Before this article appears in print five hundred Maoris will have taken their place with the regiments of the Empire in defending it in its hour of trial. As well as the Maoris, thousands of fine young men full of British energy and courage have gone out to take their share in defending Britain's honour and in upholding the British Empire. Marsden one hundred years ago made this possible. It would seem as if the spirit which inspired the ecclesiastical statesmen, such as Stephen Langton, who contributed to the foundation of England's greatness, had revived in Marsden, prompting him to lay foundations greater than he knew. He proved a truer prophet of the future than the scientist Darwin, who condemned New Zealand as unattractive, and was glad to get out of it, declaring that the natives were inferior to another admittedly inferior race, and that the English whom he found there were 'the very refuse of society.' Yet Marsden believed in the future of the country, the capabilities of the natives, and the good sense of his own countrymen; and 1914-15 proves Marsden right and Darwin wrong.

Marsden paid his seventh and last visit to New Zealand in 1837. Too feeble to walk, he had to be carried on a litter by Maori bearers who loved him. Thousands of natives came to welcome him, many journeying long distances to see the benefactor of their race. Like a

patriarch—as indeed he was—he blessed his people with many benedictions; and they sorrowed that they should see his face no more.

Returning to New South Wales, he lived for some months, and passed away on 12th May 1838, 'New Zealand' being the last words he uttered. His name and work of nation-building may soon be forgotten save by a few, or neglected by the many, as would appear to be the case to-day;

but as long as New Zealand exists, and is part of the Empire, so long will the work of Samuel Marsden have done its share in an Empire whose history has many great and marvellous deeds, but none greater than those of the Christian priest who showed a foresight, faith, and courage excelled by none in 'our fair island's story,' and who added to the island in the Northern Seas her counterpart in Southern Seas.

THE DAY OF WRATH.

A STORY OF 1914.

By LOUIS TRACY, Author of *The Final War*, *Rainbow Island*, *The Terms of Surrender*, &c.

CHAPTER X.—continued.

THEY arranged a rendezvous at Pepinster. Dalroy went alone. He insisted that this was advisable. Maertz brought Madame Joos and Irene. Joos, having been besought to curb his tongue, convoyed Léontine. Until Pepinster was reached, they took the main road, with its river of troops. None gave them heed. Not a man addressed an uncivil word to them. The soldiers were cheery and well-behaved.

They halted that night at Louveigne, which was absolutely unscathed. Next day they passed through Hamoir and Maffe, and the peasants were gathering the harvest!

Huy and Andenne, a villager told them, were occupied by the Germans, but all was quiet. They pushed on, turning north-west from Maffe, and descended into the Meuse valley about six o'clock in the evening. It was ominous that the bridge was destroyed and a cluster of houses burning in Seilles, a town on the opposite, or left, bank of the river. But Andenne itself, a peaceful and industrious place, seemed to be undisturbed. While passing a farm known as Dermine they fell in with a priest and a few Belgians who were carrying a mortally wounded Prussian officer on a stretcher.

Then, to his real chagrin, Dalroy heard that the Belgian outposts had been driven south and west only that morning. One day less in Verviers, and he and the others would have been out of their present difficulties. However, he made the best of it. Surely they could either cross the Meuse or reach Namur next day; while the fact that some local residents were attending to the injured officer would supply the fugitives with an excellent safe-conduct into Andenne, just as a similar incident had been their salvation at Argenteau.

The stretcher was taken into the villa of a well-to-do resident; and, it being still broad daylight, Joos asked to be directed to the house of Monsieur Alphonse Stauwaert. The miller was acquainted with the topography of the town,

but the Stauwaert family had moved recently to a new abode.

'Barely two hundred metres, *tout droit*,' he was told.

They had gone part of the way when a troop of Uhlans came at the gallop along the Namur road. The soldiers advanced in a pack, and were evidently in a hurry. Madame Joos was seated in the low-built, flat cart, drawn by two strong dogs, which had brought her from Verviers. Maertz was leading the animals. The other four were disposed on both sides of the cart. At the moment no other person was nearer than some thirty yards ahead. Three men were standing there in the roadway, and they moved closer to the houses on the left. Maertz, too, pulled his team on to the pavement on the same side.

The Uhlans came on. Suddenly, without the slightest provocation, their leader swerved his horse and cut down one of the men, who dropped with a shriek of mingled fear and agony.

Retribution came swiftly, because the charger slipped on some rounded cobbles, crossed its forelegs, and turned a complete somersault. The rider, a burly non-commissioned officer, pitched clean on his head, and either fractured his skull or broke his neck, perhaps achieving both laudable results, while his blood-stained sabre clattered on the stones at Dalroy's feet. The nearest Uhlans drove their lances through the other two civilians, who were already running for their lives. In order to avoid the plunging horse and their fallen leader, the two ruffians reined on to the pavement. They swung their weapons, evidently meaning to transfix some of the six people clustered around the cart. The women screamed shrilly. Léontine cowered near the wall; Joos, valiant soul in an aged body, put himself in front of his wife; Maertz, hauling at the dogs, tried to convert the vehicle into a shield for Léontine; while Dalroy, conscious that Irene was close behind, picked up the *unteroffizier's* sword.

Much to the surprise of the trooper, who selected this tall peasant as an easy prey, he parried the lance-thrust in such wise that the blade entered the horse's off foreleg and brought the animal down. At the same instant Maertz ducked, and dodged a wild lunge, which missed because the Uhlan was trying to avoid crashing into the cart. But the vengeful steel found another victim. By mischance it transfixed Madame Joos, while the horse's shoulder caught Dalroy a glancing blow in the back and sent him sprawling.

Some of the troopers, seeing two of their men prone, were pulling up, when a gruff voice cried, '*Achtung!* We'll clear out these swine later!'

Irene, who saw all that had passed with an extraordinary vividness, was the only one who understood why the order which undoubtedly saved five lives was given. A stout staff officer, wearing a blue uniform with red facings, rode with the Uhlans, and she was certain that he was in a state of abject terror. His funk was probably explained by an irregular volley lower down the street, though, in the event, the shooting proved to be that of his own men. Two miles away, at Solayn, these same Uhlans had been badly bitten by a Belgian patrol, and the fat man, prospecting the Namur road with a cavalry escort, wanted no more unpleasant surprises that evening. Ostensibly, of course, he was anxious to report to a brigade headquarters at Huy. At any rate, the Uhlans swept on.

They were gone when Dalroy regained his feet. A riderless horse was clattering after them; another with a broken leg was vainly trying to rise. Close at hand lay two Uhlans, one dead and one insensible. Joos and Léontine were bending over the dying woman in the cart, making frantic efforts to stanch the blood welling forth from mouth and breast. The lance had pierced her lungs, but she was conscious for a minute or so, and actually smiled the farewell she could not utter.

Maertz was swearing horribly, with the incoherence of a man just aroused from drunken sleep. Irene moved a few steps to meet Dalroy. Her face was marble-white, her eyes strangely dilated.

'Are you hurt?' she asked.

'No. And you?'

'Untouched, thanks to you. But those brutes have killed poor Madame Joos!'

The wounded Uhlan was stretched between them. He stirred convulsively, and groaned. Dalroy looked at the sword which he still held. He resisted a great temptation, and sprang over the prostrate body. He was about to say something, when a ghastly object staggered past. It was the man who received the sabre-cut, which had gashed his shoulder deeply.

'*Oh, mon Dieu!*' he screamed. '*Oh, mon Dieu!*'

He may have been making for some burrow. They never knew. He wailed that frenzied appeal as he shambled on—always the same words. He could think of nothing else but the last cry of despairing humanity to the All-Powerful.

Owing to the flight of the cavalry, Dalroy imagined that some body of Allied troops, Belgian or French, was advancing from Namur; so he did not obey his first impulse, which was to enter the nearest house and endeavour to get away through the gardens or other enclosures in rear.

He glanced at the hapless body on the cart, and saw by the eyes that life had departed. Léontine was sobbing pitifully. Maertz, having recovered his senses, was striving to calm her. But Joos remained silent; he held his wife's limp hand, and it was as though he awaited some reassuring clasp which should tell him that she still lived.

Dalroy had no words to console the bereaved old man. He turned aside, and a mist obscured his vision for a little while. Then he heard the wounded German hiccuping, and he looked again at the sword, because this was the assassin who had foully murdered a gentle, kind-hearted, and inoffensive woman. But he could not demean himself by becoming an executioner. Richly as the criminal deserved to be sent with his victim to the bar of Eternal Justice, the Englishman decided to leave him to the avengers coming through the town.

The shooting drew nearer. A number of women and children, with a few men, appeared. They were running and screaming. The first batch fled past; but an elderly dame, spent with even a brief flurry, halted for a few seconds when she saw the group near the dog-team.

'Henri Joos!' she gasped. 'And Léontine! What, in Heaven's name, are you doing here?'

It was Madame Stauwaert, the Andenne cousin with whom they hoped to find sanctuary.

The miller gazed at her in a curiously abstracted way. 'Is that you, Margot?' he said. 'We were coming to you. But they have wounded Lise. See! Here she is!'

Madame Stauwaert looked at the corpse as though she did not understand at first. Then she burst out hysterically, 'She's dead, Henri! They've killed her! They're killing all of us! They pulled Alphonse out of the house and stabbed him with a bayonet. They're firing through the openings into the cellars and into the ground-floor rooms of every house. If they see a face at a bedroom window they shoot. Two Germans, so drunk that they could hardly stand, shot at me as I ran. Ah, dear God!'

She swayed and sank in a faint. The flying

crowd increased in numbers. Some one shouted, 'Fools! Be off, for your lives! Make for the quarries!'

Dalroy decided to take this unknown friend's advice. The terrified people of Andenne had, at least, some definite goal in view, whereas he had none. He lifted Madame Stauwaert and placed her beside the dead body on the cart.

'Come,' he said to Maertz, 'get the dogs into a trot.—Léontine, look after your father, and don't lose sight of us!'

He grasped Irene by the arm. The tiny vehicle was flat and narrow, and he was so intent on preventing the unconscious woman from falling off on to the road that he did not miss Joos and his daughter until Irene called on Maertz to stop. 'Where are the others?' she cried. 'We must not desert them.'

In the midst of a scattered mob came the laggards. Joos was not hurrying at all. He was smiling horribly. In his hand he held a large pocket-knife, open. 'It was all I had,' he explained calmly. 'But Margot said Lise was dead, so it did his business.'

'I'm glad,' said Dalroy. 'It was your privilege. But you must run now, for Léontine's sake, as she will not leave you, and the Germans may be on us at any moment.'

Luckily the stream of people swerved into a byroad; the 'quarries' of which some man had spoken opened up in the hillside close at hand. On the top were woods, and a cart-track led that way at a sharp gradient. Dalroy assisted the dogs by pushing the cart, and they reached the summit. Pausing there, while Irene and the weeping Léontine endeavoured to revive Madame Stauwaert, to whom they must look for some sort of guidance as to their next move, he went to the lip of the excavation, and surveyed the scene.

Dusk was creeping over the picturesque valley, but the light still sufficed to reveal distances. The railway station, with all the houses in the vicinity, was on fire. Nearly every dwelling along the Namur road was ablaze; while the trim little farms which rise, one above the other, on the terraced heights of the right bank of the Meuse seemed to have burst into flame spontaneously. Seilles, too, on the opposite bank, was undergoing the same process of wanton destruction; but, a puzzling thing, rifles and machine-guns were busy on both sides of the river, and the flashes showed that a sharp engagement was taking place.

A man, carrying a child in his arms, who had come with them, was standing at Dalroy's elbow. He appeared self-possessed enough, so the Englishman sought information.

'Are those Belgian troops in Seilles?' he inquired.

The man snorted. 'Belgians? No! They retreated to Namur this morning. That is a Bavarian regiment shooting at Brandenburgers

in Andenne. They are all mad drunk, officers and men. They've been here since eleven o'clock, first Uhlans, then infantry. The burgo-master met them fairly, not a shot was fired, and we thought we were over the worst. Then, as you see, hell broke loose!'

Such was the refuge Andenne provided on Monday, 20th August. Hell—by order!

CHAPTER XI.—A TRAMP ACROSS BELGIUM.

THE stranger, a Monsieur Jules Pochard, proved a most useful friend. In the first instance, he was a cool-headed person, who did not allow imagination to run riot. 'No,' he said when questioned as to the chance of reaching Namur by a forced march along country lanes; 'every road in that section of the province is closed by cavalry patrols. You cannot avoid them, monsieur. Come with me to Huy, and you'll be reasonably safe.'

'Why safer in Huy than here, or anywhere else where these brutes may be?'

'Huy has been occupied by the Germans since the 12th, and is their temporary headquarters. From what I gather, they usually spare such towns. That is why we never dreamed of Andenne being sacked.'

Dalroy remembered the aged curé's exposition of *Kultur* as a policy. 'Is this sort of thing going on generally, then?' he asked.

Monsieur Pochard was a Frenchman. He raised his eyebrows. 'Where can you have been, monsieur, not to know what has happened at Liège, Visé, Flemelle Grande, Blagny Trembleur, and a score of other places?'

'Visé!' broke in the cracked, piping voice of Joos. 'What's that about Visé?'

'It is burnt to the ground, and nearly all the inhabitants killed.'

'Is anything said of a fat major named Busch, whom Henri Joos, the miller, stuck with a fork?'

'A Prussian, do you mean?'

'Ay. One of the same breed—a Westphalian.'

'I haven't heard.'

'He tried to assault my daughter, so I got him. The second one, an Uhlán, killed my wife, and I got him too. I cut his throat down there in the main street. It's easy to kill Germans. They're soft, like pigs.'

Though Joos's half-demented boasting was highly injudicious, Dalroy did not interfere. He was in a mood to let matters drift. They could not well be worse. He had tried to control the course of events in so far as they affected his own and Irene Beresford's fortunes, but had failed lamentably. Now fate must take charge.

Pochard's comment was to the point, at any rate. 'I congratulate you, monsieur,' he said. 'I'll do a bit in that line myself when this

little one is lodged with his aunt in Huy. If every Belgian accounts for two Prussians, you'll hold them till the French and English join up.'

'Do you know for certain where the English are?' put in Dalroy eagerly.

'Yes, at Charleroi. The French are in Namur. Come with me to Huy. A few days, and the *sables Alboches* will be pelting back to the Rhine.'

(Continued on page 228.)

PLAGUES OF FLEAS.

By D. W. O. FAGAN.

CRICKETS, caterpillars, and grasshoppers come in armies. The recurrence of such visitations in countries of the warmer temperate zone is unfortunately too well known to attract much more than a passing notice. Frequent repetition has, perhaps, induced us to regard them merely in the light of exotic variation in that perennial rotation of pests with which the farmer is afflicted. It is otherwise, however, with the periodic plagues of fleas that now and again descend on the harassed New Zealander. Though, perhaps, less economically destructive than the former class, these latter visitations have at least the questionable distinction of making themselves topically much more keenly felt.

The scope and extent of the parasitic invasions is fortunately local. The infested area seldom extends beyond a few square miles; and so rigidly do the invaders keep within bounds that, by walking half a mile and pitching one's tent beyond, it is often possible to escape the infliction altogether. Fortunately, too, the plague is generally of short duration, a month, or at most six weeks, witnessing the complete departure of the insects. The question as to how they go, or why, is as incomprehensible as the manner of their coming. They simply vanish, and there's an end. The night may be horrid with a feeling of myriad insects; multitudinous lamentation rises to high heaven; groaned curses of men, sighs of women, and sleepless wail of tortured children. Suddenly, as at a bugle-call sounding through the night, the horror ceases; harassed humanity falls asleep, and wakes to a flealess world. Hardly an insect rewards the morning search. Equally unexpected is the coming of the plague. No line of skirmishers is thrown out as a warning, no scattered vanguard as herald of the approaching host. The insect army apparently rises instantaneously out of the ground, and at once proceeds to occupy the invaded territory.

In the absence of all data it is difficult to convey any clear conception of the subject. One can only deal with personal experience and a meagre array of recorded fact. Nothing seems known as to any rule governing the visitations or the migration of the insects. Certain conditions may, of course, be predicated as contributory, but it is quite impossible to make any definite pronouncement. Thus sudden pro-

tracted drought following heavy rain may, in the case of an affected area, be regarded as the ideal condition immediately preceding the appearance of the pest; while in other and widely separated localities the plague has appeared in the dead of winter. One thing seems certain. The flea-plague is seldom recurrent in any one locality except after the lapse of many years. Indeed, a long period of years may pass without any visitation being recorded in the whole Dominion; and, again, the phenomenon may occur yearly, in rapid succession, at places widely separate; two invasions may occur in any one year simultaneously, in a coastal settlement, for instance, and again high up in the mountains of the central range. But the rule of long immunity of the place once visited holds good. Thus, during the throes of a plague that descended upon them the summer before last, the inhabitants of two mid-Canterbury runs had at least the prospective consolation of maybe half-a-century of flealess years to look forward to.

Forty years ago it fell to the writer's lot to experience something of the horror of one of these flea-plagues. Circumstances, in my case, permitted an early flight from the infested area; but after almost half-a-century of roughing it since in various out-places of the earth, the memory of these two tormentful days and anguished nights has lost nothing of its vividness. It was not so much the horrid discomfort of the time. It was, I think, the feeling of utter and absolute helplessness in the face of present misery that made it so distressing.

It was in a little coastal town not far from Dunedin, in the South Island. Waikouaiti at that time was an important little place. Untouched by the railway that now carries holiday folk past its doors, it had developed into a seaside resort of the well-to-do from its bigger neighbour. The streets of the town were wide and well planned; each house stood separate from its neighbour, on its own allotment. There was no insanitary crowding of dwellings. For nine months of the year the place was swept by the south-east trades that blew in from the sea, and during the remaining period it was scoured clean by winter rains. This stressing of the point of cleanliness is necessary in the light of what follows. Certainly one would have said it was the last possible place to offer invitation to the calamity that fell upon it.

The first intimation of coming woe arrived by way of a school picnic. Miss M. presided over a young ladies' finishing school for the daughters of neighbouring squatters. It was the lady's pleasure yearly to signalise the eve of the midsummer vacation by a picnic to some one of the beauty spots in the vicinity. This year the choice fell on the river-mouth and the ocean beach.

Miss M. led her charges toward the sandhills and the shore. The weather was hot. Immaculate muslin frocks and gay sun-bonnets were the order of the day. To an impressionable lad, fresh from a long sea voyage, it was a pretty picture. The white-clad girls, in gay waist-sashes, faces aglow with bounding health, and eyes that sparkled with pleased anticipation, stepped primly down the street two by two. The wagon carrying the picnic paraphernalia preceded the procession to the rendezvous. It was with a distinct sense of loss that I watched the cortège disappear from sight around the corner.

Suddenly there broke on the startled air a sound of lamentation. Surprised townsfolk watched a disordered bevy of girls, now headed by a weird dame who resembled an elderly dancing-dervish of the female sex, come racing up the road. Their behaviour was strange and a little alarming. They squirmed as they ran writhing, and danced as they shrieked. They beat, tore, scratched variously at parts of their anatomy, and, weeping, made as if they would tear their garments from them. Some, indeed, among the younger discarded portions of their clothing and fled incontinent and unashamed.

What was it? What meant these wild gyrations, these piteous outcries? The girls seemed panic-struck. They were evidently suffering keenly. Had linen and muslin acquired suddenly the qualities of Nessus's burning shirt that they strove so frantically to rid themselves of them?

Those who ran to help became in turn equally demented. They too danced, beat themselves with their hands, and shouted. This was the beginning. The fleas were upon us—millions of them! You could hear them patter, patter, patter, as they hopped by in armies. The ground seemed covered by a brown spray as they passed. I had read of ant armies on the march in Africa; but never in my wildest dreams could I have conceived anything like the actuality of the fleas. Dogs rolled in the dust and howled. Cats took to the bush, and were seen no more. The fleas invaded the houses. Floors and walls literally swarmed with them. They got into the food and every utensil. You ate fleas, willy-nilly, at your meals. Sleep was quite impossible. The town came within an ace of madness from protracted insomnia.

But Providence intervened. The visitation

lasted only three weeks. Night fell on the twenty-first day, and the town was one huge dolorous scratch. In the morning not a single flea remained. They had departed as suddenly as they had come. But in the meantime business was at a standstill; people were too earnestly engaged otherwise to attend to affairs of everyday life. Half the town deserted its flea-ridden domiciles, and took to living in tents on the hills. The place was practically quarantined. Instead of changing horses at the 'Golden Fleece,' Cobb & Company's coach, on its way to the Dunback goldfields, tore through the town, its six horses stretched to the gallop; and none of the neighbouring farmers ventured in to the bi-weekly market. Even the bank suspended payment for the time, and old Parson Dasent stopped the church services.

The strange part of the affair was that the insects occupied only a limited area. They possessed the town, but went no farther. The thing was so incomprehensible, so utterly beyond precedent within European memory, that it created a huge stir among scientists and professors of the day. One savant went so far as to write a treatise on the affair. His disquisition, however, failed entirely in the one essential; it offered no explanation of the how, why, or wherefore of the visitation. There were not wanting those who took an extreme view of the matter. These good folk likened it to the plagues of Egypt. It came, said they, as a distinct punishment for loose living, and advised the town to mend its ways. The culpable neglect of discrimination, however, that the insects displayed had the effect of seriously discounting this theory of the pietists. The exhorters, even while insisting, had fallen to scratching as violently as the ungodly.

The rector of the Otago High School had attached to his collegiate duties the hobby of entomology. This gentleman, in company with other wise men, came out from Dunedin to make inquiry. They subjected the entire expanse of the beach to rigid scrutiny. They examined seaweed, shells, all the jetsam of the shore, and made a microscopic investigation of the sand itself. Their research proved fruitless. They could only shake their heads and confess themselves puzzled. It was clean sea-sand, sifted by wind, scoured by rain, and baked by the sun, the last possible place to form a breeding-ground for fleas. Yet these myriads of fleas came out of it. They did not come from the land. They came hopping up the road from the seashore. They could hardly have come out of the sea. It was equally improbable they had fallen from the sky. There remained only the sand from which they could have come. But why? how? whence? The thing was declared to be utterly incomprehensible, and so it remains to this day.

AND—AT THE END?

By M. F. HUTCHINSON.

CAPTAIN ARTHUR MADOX woke with a start; for the third time he, a prisoner of war, dreamed that he heard his name called clearly again and again: 'Arthur! Arthur! Arthur!' He sat up and in the chilly darkness peered about him. The hut was perfectly still, save for the sounds of breathing from those who, like himself, were prisoners in Germany. The wind was not, as usual, shrieking round the exposed and badly constructed shelters, whistling in crevices, rushing in hideous gusts through the door.

Who called a helpless prisoner? Some one wanted him, and there was he literally fettered by the grim oppressions of those to whom he, and other men as gallant, had had to surrender. Three times had this dream come and roused him before harsh sounds made it necessary to drag through another weary day. Over and over again they had talked of escape—*talked*; but the difficulties were insuperable; and even if there had been any way of surmounting them, it was terrible to think that an attempt, probably foredoomed to failure, would make life harder and harsher for others.

There was always blessed chance; he was not the only officer who wore, under his horrible clothes, doled out at last in the camp, other things which had reached him in parcels from home.

Those precious parcels! They formed a thread of comfort even in prison life; but the winter was coming, and the prisoners dreaded it. All the simple everyday things at home, which had never seemed blessings because they were so ordinary, were now painful to remember. It was a mistake to wake at that depressing hour to think.

'Arthur! Arthur! *Arthur!*' Who had called him?

The ugly clamour of bugles, German bugles, brought sleeping men back to reality.

Arthur Madox smiled drearily as he refixed what he called his life-belt. This was a knitted comforter into which perseveringly he had sewn and stitched small pockets or divisions which contained money, meat-lozenges, and pieces of chocolate. These last, when flattened and utterly unlike chocolate, were renewed with the aid of parcels from home. He tried, so far as was possible, especially after dusk, to carry a lump of bread on his person.

Just a week before these curious dreams came to him, chance, as it seemed, had put more definite occupation in his way. A clever Englishman, a non-commissioned officer, had been put in charge of the camp lighting; but one evening, when Madox had been summoned to the guard-room to open a parcel under the eyes of the

commandant, the lamps scarcely gave any light at all. Sergeant Lukin was ill, and a new man, under summary orders, had done his best, but with no very successful result.

Madox, a deft and clever Engineer officer, thankful to do anything which took his mind off the miseries of life, soon made things better, with the pleasing result that the great man snorted and grunted, and these sounds were construed into approval. Subsequently, since things so often went wrong, he was put in charge of the group of men, supplied with special badges, who attended to the lamps. He made a round in the morning and again after dusk.

Another day! Madox, a capital musician, had contrived a regular band of men who could play mouth-organs, and introduced others who whistled. He was a clever mimic, and the only way to lighten the darkness of life was the pleasure of making other fellows laugh.

When evening came Madox went to the guard-room. The outer room was empty save for an autocratic lieutenant, a man raised from the ranks. He was writing at a small table, and Madox told himself he would keep him standing there waiting out of sheer delight in exercising his own power.

In the corner by the stove was a cupboard, the door of which stood ajar; and because of the draught—there were draughts everywhere—it creaked dismally. A window was open too.

Gottlenberg did not raise his head, but said in excellent English, of which he was very proud, to the British officer, 'Shut and lock that cupboard!' At one period in his existence he had been an English club waiter, who pocketed tips and smiled affably.

Madox bit his lip—everybody had to do that in — Camp—and stepped forward to the cupboard. He saw hanging there a gray military greatcoat belonging to the camp commandant, and the usual undress cap worn by the officials. The greatcoat had a history; it had been worn by the commandant in the great rush through Belgium, on into France, until at the Marne he had been shot through the sword-arm by a British swine. The hole in the greatcoat was neat and small enough; but the bullet, from a British rifle, he declared, was a dum-dum bullet, poisoned too, with the result that the man had had to have his arm amputated. Every one in the camp had heard the story of the bullet-marked greatcoat. There it hung in the cupboard as a persistent reminder to the commandant of his cruel sufferings.

No one had dared to whisper of poisoning after the wounding. Mardenstein was brave

enough, and had stuck to his men and their machine-gun too long.

Madox locked the cupboard, but he did not take out the keys.

Gottlenberg finished his writing, stood up, and opened a door behind him. 'Wait,' he said curtly to Madox.

Without speaking, the British officer saluted.

The moment Gottlenberg passed into the inner room orderlies sprang to attention; there were sounds, movements. The open door swung to with a bang, but instantly it was reopened by the lieutenant himself, and propped back with a lump of wood. He glanced at Madox, but the latter had not stirred. He stood just inside the room, close to the door, outside which the sentry paced.

Gottlenberg found, apparently, the occasion he loved—to reprove the orderlies. It was something to do with the stove, for there followed sharp sounds of poking and stirring.

Madox moved forward noiselessly, unlocked the cupboard, flung greatcoat and cap through the open window, and returned to his place by the door.

What a fool he was! And yet no one was likely to pass on that side of the guard-room; it was dark. Had his chance come? When the commandant returned, and he had made his report of broken lamps, would he have the courage to walk away, under the eyes of the sentry, round that side, pick up the coat and cap, and, carrying them, walk steadily on past the guards? If he did—and he made this round every night—escape from the camp would be easy enough. But it would mean going then and there, not giving him the opportunity of saying good-bye to his friends, or offering some one the chance of going with him.

What a fool he had been! The better way would be to leave the historic coat and the ordinary cap there in the dark. When the things were discovered there would be rows about it, maddening and outrageous rows; but Gottlenberg would swear that whoever did this evil thing had not accomplished it when the lieutenant was in charge of the guard-room.

The commandant came in. Madox made his report. As he was leaving the guard-room, and holding the door open, he was ordered to go to the point which should have been lighted by two lamps and see if nothing could be done. The official orders were that certain lamps must be kept burning throughout the night. The men in charge declared things were broken when they were not.

The sentry heard this order. Therefore Madox stepped out into the darkness and moved submissively out of the way of the arrogant individual who strode sharply backward and forward. Then he moved quietly round to the side of the guard-room, bending down so that no tell-tale shadow should reveal his presence,

picked up the coat, and thrust the cap into one of the large pockets.

Sentry after sentry challenged; to each Madox gave his number, adding in German the word 'Lamps.' He came close to one of the guarded entrances, and here luck favoured him, for a cart had stuck in the mud—the camp was famous for its horrible mud. The sentries could not cease their measured pacing to lend a hand.

Madox watched his opportunity, slipped behind the cart, and pushed perfunctorily, then sprang away. He was outside the camp, free for the moment—free, but for how long?

What a fool he had been! He stood stock-still, picturing the hue and cry, realising the awful moment when he would again be captured. And the end? Solitary confinement, or a short episode, soon over, in a prison yard.

Besides, had he not left his friends, and greedily seized on the chance for himself? Just then it was no comfort to remember how, over and over again, they had reminded each other that if the impossible happened, and any man had the chance of escape, he was to take it. Madox was on the point of thrusting the greatcoat into a clump of bushes and turning back to tell the sentries at the gate that after helping to shove the cart he had turned in the wrong direction. He would be marched straight to the guard-room, when the cupboard would be opened. He shrugged his shoulders, and among the bushes put on the greatcoat and cap. His teeth chattered, and he shivered in sheer misery, to use such things as a means of escape!

Then he pulled himself together, and, trusting to luck, hoped he would eventually reach a clump of trees which had been visible from the camp. The position of the camp among the wire entanglements made it impossible for the prisoners to know anything much of their surroundings. He went on doggedly, and presently halted, for he was sure he heard somewhere, quite close at hand, the monotonous pacing of a sentry. Then, moving onward, he saw that the rough road made a wide curve, and beyond it were lights, lamps alung from posts.

Free? What a fool he had been! Once more he hesitated; then, pulling himself together, he did his best to imitate the German stride. He must trust to luck that the lights, not too bright, would fail to reveal his boots, so different from the gaitered and spurred ones of the commandant. He decided to keep well in the middle of the road. He strode on very quickly. Was the commandant in the habit of walking in and out of the camp? His heart thumped like a sledge-hammer; but it so chanced that the sentry had been humming to himself, and the enormity of this crime in the presence of a uniformed official made him stand to attention and salute with elaboration.

Madox muttered something harshly and passed on his way. After twenty minutes' walking his

feet told him that he had come to a well-made road, and in the distance were lights. He must avoid habitations, so he turned on his tracks and stuck to the muddy, difficult way. He was thankful when the creaking of branches in the wind told him he had come to the clump of trees, and in the starlight he was able to see something of the outline of the tall firs. He leaned against the trunk of one, and presently clung to it, feeling more like a frightened child than a grown man. What should he do?

He struck matches, cautiously examined his compass, lifted his head to look and look at the North Star—it was comforting to stare up at the stars—and then he saw that the rough cart-track led on through the wood. Once more he walked doggedly on and on, wondering what distance he was putting between himself and the camp. When the going was easier he did not realise that he had struck a highroad until he heard the march of a patrol. He flung himself face downward among some bushes at the side of the road; the men passed without seeing him. He got up again, thinking almost longingly of his draughty corner in the hut shared with seventeen other men! He pushed on, listening breathlessly for every sound. Once he heard a voice singing somewhere quite near him. Well, he need not fear a drunken man! He plodded on and on, resting now and again, but eating nothing until the dawn broke. The daylight showed him that he was at the foot of a hill, on a good road, and in the distance he made out the dim outline of what he imagined was a farmhouse. Wearily he went on up the hill, and was thankful to notice a field-track branching off, and in the distance more friendly trees. There, in a hollow carpeted with pine-needles, he unfastened that which he had called his life-belt. He ate sparingly because of extreme thirst, and then curling himself round, fell asleep from utter weariness. He woke before it was dark, and, rising stiffly to his feet, crept on until he heard thankfully the tinkle of water.

His thirst quenched, he was troubled by a terrible problem. What should he do with the greatcoat and cap? Retain them, or leave them in the wood, buried under the pine-needles with his prison-marked clothes? He could not make up his mind.

Again he plodded on doggedly, keeping almost recklessly to the highroad. Now and again he saw gleams of light from windows, but he did not pass very near to any house. At midnight, as he stumbled on, he heard suddenly, startlingly, a shriek of terror. It was repeated again and again. He listened, hating the sound, for the cry of anguish was a woman's. He stopped, and, looking straight ahead to his right, saw lights; the cries came from there. He struck a match, and saw close at hand a gate. He opened it, and, running, reached a little house. The door ajar let out a stream of light. Again a woman

shrieked. Madox flung back the door, and saw a young woman, her hair hanging in two long plaits, in a corner of the room, with a table in front of her, and a drunken brute of a peasant threatening her, stick in hand, and laughing hideously.

At the sound of Madox's entry he turned to meet the force of a clenched fist, which rolled him over, and he lay like a log.

The woman poured out a torrent of words, overcome with gratitude. She told this German officer, who seemed to have fallen from the heavens, that the man on the floor was taking a load of sand across the river, and having lost his way, had found the house. The moment she—alone save for her children since the war—had come downstairs he had begun to behave like a cruel madman. Madox did his best to calm her. Where had the creature left his cart and horse? He had come through a closed gate, and there had been no sign of any vehicle.

The woman picked up the lamp, and, outside the little house, showed him a way leading from it communicating directly with the road. Presently they found the cart, the horse placidly munching roadside grass in the darkness. Madox was thinking desperately. Dare he trust the woman?

She began talking again, and in explaining her position and distance from the town told the fugitive a great deal he wanted to know. There was a river to cross! He came to the conclusion that it would not be wise to trust her, or, as he had thought momentarily, to take the drunken man's clothes and so disguise himself.

He dragged the man out of the house, and then accepted the German woman's offer of food and beer, which he swallowed hastily. She poured blessings upon him. Together they hoisted the man into the cart, and Madox came to the conclusion that he would drive the horse on himself in the hope of reaching the river and getting over the bridge, which was sure to be guarded.

The horse clattered on in the darkness; and Madox, knowing nothing of their actual whereabouts, hardly attempted to guide the animal. They were going downhill, and there were lights in the distance! Straining his ears to hear, he caught the echo of familiar sounds; men on guard were being relieved, others posted. Madox stood up in the cart and let out ear-piercing whistles; the horse, startled by the unusual sound, dashed forward furiously, and, feeling no restraining tightening of the reins, grew frightened. Men shouted, but the rush and clatter did not slacken until they were over the bridge. Then there was a hill to climb. The horse was easily quietened.

At length Madox, in the early morning, drove the cart into a field, threw a rough horsecloth over the animal, and shook the peasant until he stirred and attempted to sit up. Then Madox

hastened on his way, looking for a place in which to hide during the day. He could not sleep at all; something told him that he must be nearing his goal. At sunset he crept out of his hiding-place to look about him. He was on high land above a town, so he struck away to the left, and presently crossed a railway line without detection or danger to himself in the darkness. Later on he waded desperately through water which reached almost to his armpits, but he floundered out in safety. On and on—that time, when daylight came, he crouched in an old quarry and did not sleep.

Again he started to walk, and stumbled almost hopelessly through a large village, but not a voice challenged him. Again he was tormented by thirst, and driven almost crazy by agonising thought. He had dreamed in the hut in the camp that some one had called to him, and by his name. Who was there to call? His mother had long been dead, his two sisters were married, and his own wife—— Well, she had no love for him.

And now, so near safety, he was going to fail. He knew it, but still he struggled on. When the sunrise came he saw before him something like a blockhouse, men with rifles coming out and moving to positions. The frontier! He could never cross into the land of freedom—never, never! But he was desperate now. Had he a better chance in the military coat or without it? He decided to do what he could to his appearance, and to keep straight ahead, as if he were making for the official hut before him.

In agonised desperation he forged straight on, scarcely seeing, but able to control himself sufficiently to watch for a favourable moment. The men were drawn up at some distance for parade or inspection, twenty or thirty of them.

Slackening his pace, he moved steadily on up to the hut and passed it. As yet no one challenged him. Was it possible they could not have seen him? It was not possible. He was in a flat country, without helpful and friendly trees; there was, as it seemed, no help anywhere. He began to run, but the coat hampered him, and he flung it from him. Something whizzed past him. He barely turned his head. Close to his feet another bullet struck the ground. There were shouts. He ran on and on, and then saw with agonised eyes, straight ahead of him, a man with a rifle. He fell face downwards—— Then, he had failed.

He came back to consciousness, feeling his face being sprinkled with water. A voice was speaking, and in a language he did not understand. Later on, in French, he was told he must consider himself a prisoner, but he was over the frontier, on neutral soil, safe.

Of the goodness of the strangers Madox afterwards could talk for ever. There followed a week in bed, and then a journey over the sea to

England. England! He stood straining his eyes to see the outline of the coast. As they made the harbour of H., and were about to dock, those near the man who had endured so much thought he was suddenly taken ill. He hardly heard their kind voices. Several people were waiting for the ship, but he saw only one figure—that of a woman—on the quayside. His wife? It could not be his wife!

But it was. Madox could hardly speak, and she was frightened until she saw his eyes. It was his wife, and she had come to meet him! She slipped her hand under his arm and literally led him to a waiting cab. There she snuggled close to him, as she had done when they were first married.

'Oh my dear! my dear! I have been breaking my heart for you. What could I say in those letters read by others? Every morning before dawn I would wake hearing myself call, as if you, poor darling, could hear, "Arthur!" Forgive me for everything; say you love me.'

'I heard you call,' he answered softly; 'I heard you.' And again the look on his face contented her.

Afterwards, one haunting terror ceased to torment him. His friends and fellow-prisoners had not suffered from harsher treatment. They were evidently allowed to say, in their letters home, that Madox of the —— had attempted to escape and been shot by the sentries. They missed him greatly. But he was alive and well, and going back to work. As the days passed he could smile over a persistent thought: would Mardenstein, stern but never cruel, retrieve his historic greatcoat? Did it hang in the cupboard of the guard-room?

A SPRING SONG.

LISTEN to the fresh Spring wind
Singing o'er the downs,
Blowing kisses as it goes,
Smoothing winter's frowns.
All the tender little buds
Quiver with delight;
'Spring is dancing on the downs,
April is in sight.'

Birds catch up the song of joy,
Fling it back again;
Brighter, louder, on it goes,
Spring's new old refrain.
Fairies sailing on the clouds
Flit in chase of Spring;
She's the queen among them all,
Seeking her they sing:

'All the winter we have been
Playing in the moon;
But we're coming back to earth
Very, very soon.'
Far and wide the happy wind
Rushes in delight,
Crying, 'Come and dance with me,
April is in sight.'

Chambers's Journal

SEVENTH SERIES

THE DISCONTENTED SQUIRREL

By W. H. HUDSON,

Author of *The Purple Land*, *Adventures among Birds*, *Birds and Man*, &c.

HURRYING along the street the other day, intent on business, I was brought to a sudden full stop by the sight of a heap of old books in tattered covers outside a second-hand furniture shop. I didn't want old books, and had no time to spare; the action was purely automatic, like that of the old horse ridden or driven by a traveller who often refreshes himself, in stopping short on coming to a public-house on the roadside. On the top of the heap was a small pamphlet or booklet in blue covers, entitled *The Discontented Squirrel*, and this attracted my attention. It seemed to touch a chord, but a chord of what I did not know. I picked it up, and, opening it, saw on the first page an ancient rude woodcut of a squirrel eating a nut.

The old picture looked familiar, but I was still at a loss until I read the first few lines of the letterpress, and then I immediately dropped the booklet and hastened on faster than ever to make up for a wasted minute.

Why, of course, the Discontented Squirrel, that dear little ancient beastie! The whole of the child's tale came back with a rush to memory, for I had read and re-read it when my age was seven; though I had never since met with it in the hundreds of boxes of old books turned over in my time, or in any collection of children's books of the early nineteenth century. I once made a small collection of such literature myself, and others have collected and still collect it in a large way. I sometimes wonder why some enterprising publisher doesn't start an Every Child's Library, and rescue many of the most charming of these small publications from total oblivion. Undoubtedly he would find the best period was from 1800 to about 1840.

Once upon a time—so ran the story as I remembered it, and retold it to myself while walking on—a squirrel lived in a wood, as plump and playful and happy a squirrel as one would wish to see. He had a favourite tree, an old giant oak, which was his home, and when summer was nearing its end he began to amuse himself by making a warm nest in a cavity down at the roots; also by hoarding a quantity of hazel-nuts, which were

plentiful just then in the wood. This he did, not because he had any reason for doing it, or thought there was any use in it, but solely because it was an old time-honoured custom of the squirrel tribe to do these things.

While occupied in this way he all at once became aware of a new restlessness and excitement among the birds, and when he asked his feathered neighbours what it was all about they were surprised at his innocence, and answered that it was about migration. And what was migration? A funny question to put to a bird! However, they condescended to inform their ignorant young friend, that migration meant going away from the country in order to escape the winter. For now winter was coming, that sad season of leafless trees and of short, dark days; of wet and wind and bitter, bitter cold, when lakes and streams would be frozen over and the earth buried in white, awful snow.

And where would they go to escape these awful changes?

They would go to a land where there was no winter; where the trees were green all the year round, with flowers always blooming, and fruit and nuts always ripening.

'Oh beautiful land! oh happy birds!' thought the squirrel. 'But where is that desirable country?' he asked.

'Over that way,' replied the birds, pointing to the south, just as if it were a place quite near. 'It was,' they added, 'beyond the ridge of blue hills one could see on that side.'

These tidings threw the squirrel into a great state of excitement, and he spent his whole time running after and questioning every bird he knew. 'When,' he asked, 'would the migration begin?'

They laughed at the question, and said it had begun some time ago, and was going on at the present moment. The swift had long been gone; so had the nightjar; the cuckoo too; and others were beginning to follow.

The cuckoo—his own neighbour and familiar friend! Ah, that was why he hadn't seen him for some days past! And then began an unhappy time for the squirrel, and every day

and every hour increased his discontent. The yellowing leaves, the chillier evenings, and long nights filled him with apprehension of the coming change, and at last he resolved that he would not endure it. For why should he stay in such a land when all his feathered neighbours and friends were now hurrying away to a better one?

Having made up his mind to migrate, he set out at dawn of day, and travelled many miles toward those blue hills in the south, which turned out to be much farther than he had thought. It was not until the late afternoon that he arrived at the foot of the ridge, feeling more tired and sore-footed than he had ever been in his life. Nevertheless, he was determined not to give in, but to cross the hills before dark, and in crossing them perhaps view from the summit that beautiful land to which he was travelling. And so up and ever up he went, finding it more fatiguing every minute, until he began to despair of ever reaching the summit. And he never did; it was too high, and he was now spent with hunger and weakness after his long, fatiguing day. Furthermore, the hillside grew more and more barren and desolate as he got higher, until he found himself in a place where it was all stony, without trees and bushes or even grass; and there was no food to be found, and no shelter from the cold, violent wind.

He could go no farther, and the summit was still far, far above him. Hunching himself up on the stony ground, with his nose down between his paws and his bushy tail spread along his back, he began to reflect on his condition.

Why had he not taken into account that he could not travel like a bird with wings to bear him through the air and over hills and rivers and long stretches of rough country? And when he asked the birds how long it would take them to reach that happy land of everlasting sunshine beyond the blue ridge, had they not answered in a careless way, as if they thought little of it, 'Oh, not long; two or three or four weeks, according to one's powers'? And it never occurred to him that a bird can fly farther in half-an-hour than a squirrel can travel in a whole day! Now, when it was too late, when he could not go forward, and his home was too far, far behind him, he remembered and considered these things. Oh poor squirrel! Oh miserable end of all your happy dreams!

And while he was sitting hunched up, shivering with cold and thinking these bitter, desponding thoughts, a passing kite spied him, and, swooping down, snatched him up in his talons and carried him off. Little strength had he now to struggle, and at his least movement the sharp, crooked claws tightened their grasp; and even if he had been able to free himself, it would only have been to fall that vast dis-

tance through the void air and be crushed on the earth.

Then all at once the bird's flight grew swifter and he rose higher, for now a second kite had appeared, and had given chase to the first to deprive him of his prey.

The first, burdened with the squirrel, could not escape from his persecutor, and they were soon at close quarters. The marauding bird now began making furious swoops at the other, aiming blows at his back with his claws, and every time he swooped down he uttered savage cries and mockings. 'Aha!' he cried, 'you can't save yourself with all your speed and all your doublings. Drop the squirrel if you don't want your back cut into strips. Do you remember, you red scoundrel, that you found me carrying home a dead duckling I had picked up at a farm, and that you made me drop it? Do you remember what you said on that occasion—that I was burdened while you were free, and therefore had the advantage of me, and would claw my back to ribbons unless I dropped the duckling? Well, robber—pirate! who has the advantage now?'

It was awful, that battle in the sky; the blows, the shrieks, the dreadful words they hurled at one another; but in the end the kite was obliged to drop the squirrel to defend himself with his claws, and the poor little beastie dropped earthward like a stone, and would have been crushed if he had fallen upon the ground; but luckily he first struck a close mass of twigs and foliage on the top of a large tree. This broke the violence of the fall, and he came down gently to the branches beneath, when he managed to catch hold of a twig and come to a stop. He was bruised and bleeding, and half-dead with the shock; but by-and-by he revived, and then what was his relief and joy to discover that he was at home—that he had fallen into his own favourite old oak-tree! On recovering a little strength he crept down the trunk, and after satisfying his hunger with two or three hazel-nuts from his store, he crawled into his unfinished nest, where he coiled himself up, and drawing his blankets over his ears, mused drowsily on his unspeakable folly in having forsaken so comfortable a home. And as to migration—well, 'Never again!' he murmured as he dropped off to sleep.

The story greatly pleased me as I retold it to myself, after having forgotten it for so many long years, since I now perceived that it was a fable of the right sort; that, in fact, it was a true story—in other words, true to the creature's character. Stories about reasoning and talking animals do not always conform to this rule which has made the terse fables of Æsop a joy for ever. Whether the author knew it or not, it is a fact that the squirrel is subject to fits of discontent with his surroundings, which send him rushing off in quest of some better place to

live in; and at such times he will make his way, or try to, over wide stretches of barren, unpromising country. Thus, when trees are planted in a treeless district, by-and-by squirrels make their appearance, even when their nearest known haunts are many miles distant. Nor is this only an occasional outbreak of a gipsy roving disposition of the animal, since he too is subject to migratory impulses at the same time of year as the birds. In some countries large numbers of squirrels are affected simultaneously in this way, and have been observed migrating, many perishing when attempting to cross rivers too wide or swift for them.

I also liked the story because it recalled a squirrel's adventures told to me a short time before by an old fisherman at Wells-next-the-Sea, in Norfolk. Wells lies at the edge of a marsh a mile and a quarter back from the sea, and has a harbour, a river or estuary which at full tide is deep enough to enable small vessels to come up to the town. Near the river's mouth there is a row of tall guiding-poles in the channel, and one afternoon my informant noticed a squirrel sitting bunched up on the summit of the outermost pole, about thirty feet above the water. Evidently he had come through the pine plantation on the sand-dunes on the Holkham or north side of the river; but, anxious to continue his travels southward along the shore and over the vast flat saltings toward Blakeney, he had cast himself into the river, and finding the current too strong, had just saved himself from being carried out to sea by climbing up the last pole. Now the current was the other way, and the river full from bank to bank, and the poor squirrel on his pole-top was in the middle of the swirling current, and dared not venture either to go forward or back to the wood.

The fisherman went home to his tea; but, two hours later, just about sunset, he strolled back to the sea-front, and there still sat the squirrel bunched up on the top of his pole. Presently a fishing-boat came in from the sea, with only one person, a young man, in it. The old man hailed him, and called his attention to the squirrel on the pole. 'All right; I see him!' shouted back the young fellow. 'I'll try to get him off!'

Then, as the swirling current carried the boat up to within about three yards of the pole, he leant forward and thrust out an oar until the blade touched the pole; and no sooner had it touched than down like lightning came the squirrel from his perch, leaped upon the oar, and from the oar to the boat, then quickly bounded up the mast and perched himself on the top.

The squirrel had not understood the man's friendly intentions, and his lightning-quick action

appeared not to have been prompted either by reason or instinct, but rather by that intuitive faculty one is half-inclined to believe in, which causes an animal suddenly threatened with destruction to take instantly the one line by which it may be saved.

The boat went swiftly on, driven by the rushing tide, until it reached the quay at Wells, and no sooner did the keel touch the stones at the landing-stage than down the squirrel flew from the mast-top, and, rushing to the bow, took a flying leap to the land, then dashed off toward the town at topmost speed. A number of children playing on the quay saw him, and with a wild cry of 'Squirrel! squirrel!' went after him. Luckily there was no dog about; and the squirrel, being faster than the boys, kept well ahead, and, dodging this way and that among coal-trucks, and wagons and horses, and men occupied in unloading, got through them all, then crossing the lower or coast road, dashed into one of the wynds or narrow streets which run up to the higher part of the town. There more yelling children joined the hunt, and the people of the wynd ran out of their houses to find out what all the uproar was about.

The wynd ends at the upper street, and facing it is a long brick wall ten feet high, and up this wall went the squirrel without a pause or slip, and as swiftly as when going over the level earth, and disappeared over the top into the orchard on the other side. There the loud advancing wave of young barbarians was stayed by an ocean-facing cliff.

It had been a dashing performance, and the squirrel could now have settled safely down in that sheltered spot among its fruit and shade trees, since the tenant, who lived a hermit life in the house, was friendly to all wild creatures, and allowed neither dogs nor cats nor fiends in shape of boys with loud halloo and brutal noise, to intrude into his sacred grounds.

But this would not have suited the squirrel; the town noises and lights, the shrill cries of children at play in the evening, and the drum and fife band of the Boy Scouts would have kept him in a constant state of apprehension. Squirrels are nervy creatures. No doubt when the town was asleep and silent that night he scaled the back-wall and crossed other orchards and gardens until he came out to the old unkept hedge on that side, and followed it all the way to Holkham Park, a vast green solitude with many ancient noble trees, in one of which he probably first saw the light.

And there at home once more, he perhaps resolved, like the Discontented Squirrel of the fable, never again to attempt to better himself by migrating.

THE DAY OF WRATH.

CHAPTER XI.—*continued.*

FOR the second time Dalroy heard a slang epithet new to him applied to the Germans. He little guessed how familiar the abbreviated French form of the word would become in his ears. Briton, Frenchman, Slav, and Italian have cordially adopted 'Boche' as a suitable term for the common enemy. It has no meaning, yet conveys a sense of contemptuous dislike. Stricken France had no heart for humour in 1870. The merciless foe was then a 'Prussian'; in 1914 he became a 'Boche,' and the change held a comforting significance.

Dalroy, of course, did not share the Frenchman's opinion as to the speedy discomfiture of the invader; but night was falling, and the offer of shelter was too good to be refused. Nevertheless, he was careful to reveal a real difficulty. 'Unfortunately, we have a dead woman in the cart,' he said. 'Madame Stauwaert, too, is ill; but she has recovered from a fainting fit, I see.'

'Ah, poor Stauwaert!' murmured the other. 'A decent fellow. I saw them kill him. And that's his wife, of course. I didn't recognise her before.'

Dalroy was relieved to find that the Frenchman and the bereaved woman were friends. He had not forgotten the priest's statement that there would be a spy in every group in that part of Belgium. Later he ascertained that Monsieur Pochard was a well-to-do leather merchant in Andenne, who, like many others, refused to abandon a long-established business through fear of the Germans. Doubtless he was destined to pay a heavy price for his tenacity ere the war ended. He behaved now as a true Samaritan, urging an immediate move, and promising even to arrange for Madame Joos's burial. Dalroy helped him to carry the child, a three-year-old boy, who was very sleepy and peevish, and did not understand why he should not be at home and in bed.

Joos suffered them to lead him where they listed. He walked by the side of the cart, and told 'Lise' how he had dealt with the Uhlan. Léontine sobbed afresh, and tried to stop him, but he grew quite angry.

'Why shouldn't she know?' he snapped. 'It is her affair, and mine. You screamed, and turned away, but I hacked at him till his wind-pipe hissed.'

Monsieur Pochard brought them to Huy by a rough road among the hills.

It was a dreadful journey in the gloaming of a perfect summer evening. The old man's ghouliah jabbering, the sobs of the women, the panting of two exhausted dogs, and the wailing of the child, who wanted his father's arms round him rather than a stranger's, supplied a tragic

chorus which ill beguiled that *Via Dolorosa* along the heights of the Meuse.

Irene insisted on taking the boy for a time, and the youngster ceased his plaint at once.

'That's a blessed relief,' she confided to Dalroy. 'I'm not afflicted with nerves, but this poor little chap's crying was more than I could bear.'

'He is too heavy for you to carry him far,' he protested.

'You're very much of a man, Arthur,' she said quietly. 'You don't realise, I suppose, that nature gives us women strong arms for this very purpose.'

'I hadn't thought of that. The fact is, I'm worried. I have a doubt at the back of my head that we ought to be going the other way.'

'Which other way?'

'In precisely the opposite direction.'

'But what can we do? At what stage in our wanderings up to this very moment could we have parted company with our friends? Do you know, I have a horrible feeling that we have brought a good deal of avoidable misery on their heads. If we hadn't gone to the mill'—

'They would probably all have been dead by this time, and certainly both homeless and friendless,' he interrupted. Then he began telling her the fate of Visé, but was brought up short by an imperative whisper from Pochard. They were talking English, without realising it, and Huy was near.

'And why carry that sword?' added the Frenchman. 'It is useless, and most dangerous. Thrust it into a ditch.'

Dalroy obeyed promptly. He had thoughtlessly disregarded the sinister outcome if a patrol found him with such a weapon in his hand.

They came to Huy by a winding road through a suburb, meeting plenty of soldiers strolling to and from billets. Luck befriended them at this ticklish moment. None saw a little party turning into a lane which led to the back of the villa tenanted by Monsieur Pochard's married sister. This lady proved both sympathetic and helpful. The cart, with its sad freight, was housed in a wood-shed at the bottom of the garden, and the dogs were stabled in the gardener's potting-shed.

'The ladies can share my bedroom and my daughter's,' she said. 'You men must sleep in the greenhouse, as every remaining room is filled with Uhlans. Their supper is ready now, but there is plenty. Come and eat before they arrive. They left on patrol duty early this morning.'

And that is where the fugitives experienced

a stroke of amazing good fortune. That particular batch of Uhlans never returned. It was supposed that they were cut off while scouting along the Tirlemont road. Apparently their absence only contributed to an evening of quiet talk and a night of undisturbed rest. In reality, it saved the lives of the whole party, including the hostess and her family.

Early next morning Monsieur Pochard interviewed an undertaker, and Madame Joos was laid to rest in the nearest cemetery. Maertz, Madame Stauwaert, and Léontine attended the funeral. Joos showed signs of collapse. His mind wandered. He thought his wife was living, and in Verviers. They encouraged the delirium, and dosed him with a narcotic.

Irene helped in the kitchen, and Dalroy dug the garden. Thus the confederacy remained split up during the morning, and was not noticed by an officer who came to inquire about the missing Uhlans.

About noon Monsieur Pochard drew Dalroy aside. 'Monsieur,' he said, and his face wore anxious lines, 'last night the old man implied that he was Henri Joos, of Visé. No; please listen. I don't want to be told. I can only give you certain facts, and leave you to draw your own conclusions. Active inquiries are being made by the authorities for Henri Joos, Elisabeth Joos, Léontine Joos, their daughter, and Jan Maertz, all of Visé. With them are an Englishwoman aged twenty, and an English officer named Dalroy, both dressed as Belgian peasants. The appended descriptions seem to be remarkably accurate, and a reward of one thousand marks is offered for their capture.'

'They may be willing to pay double the price for freedom,' said Dalroy.

The Frenchman was not offended. He realised that this was not a suggestion of a personal bribe.

'You have not heard all,' he continued. 'These people were traced to Verviers, but the trail was lost after Maertz bought a cart and a dog-team in that town three days ago. Unfortunately some Uhlans who passed through Andenne last night have reported the presence of just such a party on the main road. Other soldiers believe they saw a similar lot entering Huy after dark, and the burgomaster is warned that the strictest search must be made among refugees at Huy. To make sure, a German escort will assist. It is estimated that Joos and the others will be caught, because they will probably depend on a *laissez passer* issued in Argenteau under false names, which are known. Joos figures as Wilhelm Schultz, for instance. Don't look so surprised, monsieur. The burgomaster is my brother-in-law's partner. He will not reach this quarter of Huy till half-past three or four o'clock.'

'But there is the record of Madame Joos's burial,' put in Dalroy instantly.

'No. The poor creature remains a "woman unknown, found dead." The Germans don't worry about such trifles. But, by a strange coincidence, Madame Stauwaert practically takes her place for identification purposes. By the mercy of Providence, no German soldier was in this house last night, or he would now be the richer by a thousand marks. The notice is placarded at the *Kommandantur*, and is being read by the multitude.'

'We shall not bring further trouble on a family which has already run grave risk in our behalf,' vowed Dalroy warmly. 'We must scatter at once, and, if caught, suffer individually.'

'I was sure you would say that, monsieur; but sworn allies carry friendship to greater lengths. Now let us take counsel. Madame Stauwaert can remain here. Fifty people in Huy will answer for her. My sister can hire a servant, Léontine. If Joos is tractable he can lodge in safety with some cottagers I know. Maertz wishes to join the Belgian army, and you the British; while that charming young lady will want to get to England. Well, we may be able to contrive all these things. I happen to be a bit of an antiquary, and Huy owns more ruined castles and monasteries than any other town of similar size in Belgium, or in the world, I imagine. Follow my instructions to the letter, and you will cheat the Germans yet. They are animals of habit and cast-iron rule. When searching for six people they will never look for one or two. Yet it would be folly if you and mademoiselle wandered off by yourselves in a strange country. Then, indeed, even German official obtuseness might show a spark of real intelligence; whereas, by gaining a few days, who knows whether your armies may not come to you, rather than you go to them?'

The good-hearted Frenchman's scheme worked without a hitch. The cart was broken up for firewood, the harness burnt, and the dogs taken a mile into the country by Maertz, who sold them for a couple of francs, and came back to a certain ruined priory by a roundabout road.

Irene and Dalroy had gone there already. The place lay deep in trees and brushwood, and was approachable by a dozen hidden ways. Although given over to bats and owls, its tumble-down walls contained one complete room, situated some twenty feet above the ground-level, and reached by a winding staircase of stone slabs, which looked most precarious, but proved quite sound if used by a sure-footed climber.

Here, then, the three dwelt eleven weary days. During daylight their only diversion was the flight of hosts of aeroplanes toward the French frontier. Twice they saw Zeppelins. For warmth at night they depended on horse-rugs and bundles of a species of bracken which throve

among the piles of stones. They were well supplied with food, deposited at dusk in a fosse, and obtained when the opening bars of 'La Brabançonne' were whistled at a distance. The air itself was a guarantee that no German was near, because the Belgian national anthem is not pleasing to Hun ears.

A typed note in the basket formed their sole link with the outer world. And what momentous issues were conveyed in the briefest of sentences!

'Namur has fallen after a day's bombardment by a new and terrible cannon.'

'Brussels has capitulated without resistance.'

'After a fierce battle, the French and English have retired from Charleroi and Mons.'

'The retreat continues. France is invaded. Valenciennes has fallen.'

On the eleventh morning Dalroy hid among the bushes until the daily basket was brought. Monsieur Pochard himself was the go-between. He feared lest Léontine would contrive to meet Maertz, so the girl did not know where her lover was hidden.

The Frenchman started visibly when Dalroy's voice reached him; but the latter spoke in a tone which would not carry far. 'I'm sorry to seem ungrateful,' he said, 'but we are growing desperate. Do us one last favour, monsieur, and we shall impose no more on your goodness. Tell me where and when we can cross the Meuse, and the best route to take subsequently. Sink or swim, I, at any rate, must endeavour to reach England; and mademoiselle is equally resolved to make the attempt.'

'I don't blame you,' came the sorrowful reply. 'This is going to be a long war. Twenty years of deadly preparation are bearing fruit. I am sick with anxiety. But I dare not loiter in this neighbourhood; so, as to your affair, my advice is that you cross the Meuse to-morrow in broad daylight. The bridge is repaired, and no very strict watch is kept. Make for Nivelles, Enghien, and Oudenarde. The Belgians hold the Antwerp-Gand-Roulers line, but are being driven back daily. I have been thinking of you. If you delay longer you will—at the best—be imprisoned in Belgium for many months. Are you determined?'

'Yes.'

'Do you want money?'

'We have plenty.'

'Farewell, then; and may God protect you!'

'Is there no chance of nearing the British force?' was Dalroy's final and almost despairing question.

'Not the least. You would be following on the heels of a quick-moving and victorious army. Progress is slower toward the coast. You have a fighting chance that way, none the other. Good-bye, monsieur.'

'Good-bye, best of friends!'

The sudden collapse of Namur, and the con-

sequent failure of the Anglo-French army's initial scheme, had served to alter this shrewd man's opinion completely. His confidence was gone, his nerve shaken. The pressure of the jack-boot was heavy upon him. Dalroy was certain that he walked away with a furtive haste, being in mortal fear lest the people he had helped so greatly might put forth some additional request which he dared not grant.

Next morning they left the priory grounds separately, and strolled into the town, keeping some fifty yards apart. It was only after a struggle that Jan Maertz relinquished the notion of trying to see Léontine before going from Huy, but the others convinced him that he might imperil both the girl and their benefactors. As matters stood, her greatest danger must have nearly vanished by this time; it would be a lamentable thing if her lover were arrested, and it became known that he had visited the villa.

They crossed the river on pontoons. The Germans were already rebuilding the stone bridge. They seemed to have men to spare for everything. That the bridge was being actually rebuilt, and not made practicable by timber-work only, impressed Dalroy more forcibly than any other fact gleaned during his Odyssey in a Belgium under German rule. There was no thought of relinquishing the occupied territory, no hint of doubt that it might be wrested from their clutch in the near future. He noticed that the post-office, the railway station, the parcels-vans, even the street names, were Germanised. He learnt subsequently that the schools had been taken over by German teachers, while the mere sound of French in a shop or public place was scowled at, if not absolutely forbidden.

There were not many troops on the roads, but crowded troop-trains passed on both sides of the Meuse, and ever in the same direction. Two long hospital trains came from the south-west, and Dalroy knew what *that* meant. Another long train of closed wagons, heavily laden, as a panting engine testified, perplexed him, however. He spoke of it to Maertz, the three being on the road in company as they climbed the hill to Heron, and the carter promptly sought information from a farmer.

The man eyed them carefully. 'Where are you from?' he demanded in true Flemish.

'What has that to do with it?' grinned Maertz, in the same *patois*.

The questioner was satisfied. He jerked a thumb toward the French frontier. 'Dead uns!' he said. 'They're killing Germans like flies down yonder. They can't bury them—haven't time—so they tie the corpses together, slinging four on a pole for easy handling, ship them to Germany, and chuck them into furnaces.'

'So,' guffawed Maertz, 'the swine know where they are going, then!'

To Dalroy's secret amazement, Irene, who understood each word, laughed with the others.

Campaigning had not coarsened, but it had undeniably hardened her nature. A month ago she would have shuddered at sight of these dun trucks, with their ghastly freight. Now, so long as they only contained Germans, she surveyed them with interest.

'Allowing forty bodies to one wagon,' she said, 'there are over a thousand dead men in that train alone.'

The farmer spat approval. 'I've been busy, and have missed some; but that's the tenth lot which has gone east this morning,' he remarked cheerfully.

'Is the road to Nivelles fairly open?' Dalroy ventured to inquire.

'One never knows. Anyhow, always give the next village as your destination. If doubtful, travel by night.'

This counsel was well meant. In the silent bitterness of hours yet to come, Dalroy recalled it, and wished he had profited by it.

Roughly speaking, they had set out on a seventy-mile tramp, which the men could have tackled in two long days. But the presence of Irene lowered the scale, and Dalroy apportioned matters so that twenty miles daily formed their programme, with, as the *entrepreneurs* say, power to increase or curtail. Thus, on the first evening, the date being 2nd September, they pulled up at Gembloux, quite a small place, finding supper and beds in a farm beyond the village.

Next day they pushed ahead through Nivelles, and entered the forest of Soignies, that undulating woodland on which Wellington depended for the protection of a dangerous flank during the unavoidable retreat to the coast if Napoleon had beaten the British army at Waterloo.

Dalroy explained the Iron Duke's strategy to Irene as they paced a road which provides an ideal walking tour.

'That a General was not worth his salt who did not secure the track of his army if defeated was one of his fixed principles,' he said. 'He would never depart from it, and his dispositions at Waterloo were based on it. In fact, his solicitude in that respect nearly caused a row between him and Blücher.'

'Let me see,' mused the girl aloud. 'The Germans have never fought the British in modern times until this war.'

'That is correct.'

'And how far away is Mons?'

Dalroy smiled at the thought which had evidently occurred to her.

'We are now just half-way between Mons and Waterloo. Each is about ten miles distant.'

'We were allied then with the Belgians, Germans, and Russians against the French. Now we have joined the Belgians, French, and Russians against the Germans. It sounds like counting in a game of cribbage. A hundred years from to-day our combination may be with

the Belgians, Germans, and French against the Russians.'

'You mustn't even hint treason against our present Allies,' he laughed.

'What are Allies? Of what avail are treaties? You men have mismanaged things woefully. It is high time women took a hand in governing.'

'Awful! I do verily believe you are a suffragette.'

'I am. During what periods has England been greatest? In the reigns of Elizabeth and Victoria.'

'Why leave out poor Queen Anne?'

'She was a very excellent woman. As soon as she came to the throne she declared her resolution "not to follow the example of her predecessors in making use of a few of her subjects to oppress the rest." The common people don't err in their estimate of rulers, and they knew what they were about in christening her "Good Queen Anne."'

'Now I'm sure.'

'Sure of what?'

'You have never told me what you were doing in Berlin.'

'You haven't asked me,' she broke in.

'Did it matter? I'—

Irene's intuition warned her that this harmless chatter had swung round with lightning rapidity to a personal issue. Sad to relate, she had not washed her face or hands for eleven days, so a blush told no tales; but she interrupted again rather nervously, 'What is it you are sure of?'

'You must have been a governess-companion in some German family of position. I can foresee a trying future. I must brush up my dates, or lose caste for ever. Isn't there a doggerel jingle beginning:

In fifty-five and fifty-four
Came Cæsar o'er to Britain's shore?

If I learn it, it may save me many a trip.'

'Here, you two,' growled Jan Maertz, 'talk a language a fellow can understand.'

The road was deserted save for themselves, and the others had unconsciously spoken English. Dalroy turned to apologise to their rough but trusty friend, and thus missed the quizzical and affectionate glance which Irene darted at him. She was still smiling when next he caught her eye.

'What is it now?' he asked.

'I was thinking how difficult it is to see a wood for the trees,' she replied.

Maertz took her literally.

'I'll be glad when we're in the open country again, mademoiselle,' he said. 'I don't like this forest. One can't guess what may be hiding round the corner.'

Yet they stopped that night at Braine-le-Comte, and crossed Enghien next day without incident. It is a pity that such a glorious ramble should be described so baldly. In

happier times, when Robert Louis Stevenson took that blithe journey through the Ardennes with a donkey, a similar excursion produced a book which will be read when the German madness has long been relegated to a detested oblivion. But Uhlan pickets and 'square-head' sentries supply wretched sign-posts in a land of romance, and the wanderers were now in a region where each kilometre had to be surveyed with caution.

Maertz owned an aunt in every village, and careful inquiry had, of course, located one of these numerous relatives in Lierde, a hamlet on the Grammont-Gand road. Oudenarde was strongly held by the enemy, but the roads leading to Gand were the scene of magnificent exploits by the armoured cars of the Belgian army. Certain Belgian motorists had become national heroes during the past fortnight. An innkeeper in Grammont told with bated breath how one famous driver, helped by a machine-gun crew, was accounting for scores of marauding cavalymen. 'The English and French are beaten, but our fellows are holding them,' he said with a fine air. 'When you boys get through you'll enjoy life. My nephew, who used to be a great *chasseur*, says there is no sport like chasing mounted Boches.'

This frank recognition of Dalroy as one of the innumerable young Belgians then engaged in crossing the enemy's lines in order to serve with their brothers was an unwitting compliment to a student who had picked up the colloquial phrases and Walloon words in Maertz's uncouth speech. A man who looked like an unkempt peasant should speak like one, and Dalroy was an apt scholar. He never trod on doubtful ground. Strangers regarded him as a taciturn person, solely because of this linguistic restraint. Maertz made nearly all inquiries, and never erred in selecting an informant. The truth was that German spies were rare in this district. They were common as crows in the cities, and on the frontiers of Belgium and France, but rural Brabant harboured few, and that simple fact accounts for the comparatively slow progress of the invaders as they neared the coast.

It was at a place called Oombergen, midway between Oudenarde and Alost, that the fugitives met the Death's-Head Hussars. And with that ill-omened crew came the great adventure.

CHAPTER XII.—AT THE GATES OF DEATH.

HAD Dalroy followed his own plans, supported as they were by the well-meant advice tendered by the farmer of the Meuse valley, he might have led his companions

through the final barrier without incurring any risk at all comparable with the hair-breadth escapes of Visé, Argenteau, Andenne, and Huy.

But the weather broke. Rain fell in torrents, and Irene's presence was a real deterrent to spending a night in a ditch or lurking in the depths of a wood till dawn. Maertz, too, jubilant in the certainty that the Belgian outposts were hardly six miles distant, advocated the bold policy of a daylight march. Still, there was no excuse for Dalroy, who knew that patrols in an enemy's country are content to stand fast by night, and scout during the day. Unluckily, Irene was as eager as their Belgian friend to rush the last stage. She was infected by the prevalent spirit of the people. Throughout the whole of September these valiant folk in the real Flanders held the Germans rather cheap. They did not realise that outpost affairs are not battles—that a cavalry screen, as its very name implies, is actually of more value in cloaking movements of armies in rear than in reconnoitring.

Be that as it may, in the late afternoon of 5th September the three were hurrying past some lounging troopers who had taken shelter from the pouring rain in the spacious doorway of a ruined barn, when one man called to them, 'Hi! where are you off to?'

They pretended not to hear, whereupon a bullet passed through Dalroy's smock between arm and ribs.

It was useless to think of bolting from cavalry. They turned at once, hoping that a bold front might serve. This occurred a mile or more from Oombergen. Maertz had 'an aunt' in Oosterzeele, the next village, and said so.

'If she's anything like you, you're welcome to her; but let's have a look at your cousin,' grinned the German, striding forward, carbine in hand, and grasping Irene by the shoulder.

'You stop here, *Fräulein*—or, is it *Frau*?' he said, with a vilely suggestive leer. 'Anyhow, it doesn't matter. If one of these pig-heads is your husband, we can soon make you a widow.'

Now to Irene every German soldier was a boor, with a boor's vices and limitations. The man, a corporal, spoke and acted coarsely, using the *argot* of the barrack-room, and she was far too frightened to see in his satyr-like features a certain intellectuality. So, in her distress, she blundered twice.

'Leave me alone!' she said shrilly, trying in voice and manner to copy Léontine Joos.

'Now don't be coy, pretty one,' chuckled the trooper, beginning to urge her forcibly in the direction of the barn.

(Continued on page 246.)

THE BLACK DEATH IN THE TWENTIETH CENTURY.

By I. I. BRANTS.

WHAT will peace mean? The abnormal duration of a war waged on the scale of the present war has almost ceased to surprise. Humanity seems gradually to accommodate itself to a condition of belligerency. All our thoughts are concentrated, and rightly so, on the winning of a decisive victory. But what about the peace which at some time will be with us again? Politically we expect to leave Europe settled, if not permanently, at least for a considerable time to come. Socially, however, the war will have no less incisive consequences. Even if a cessation of hostilities were to overtake the world at this stage, it would find countries like Austria, and especially Germany, bereft of the best of their labouring power, both industrially and agriculturally. Quite apart from the financial disorganisation, and the westward wandering of gold-supplies, the mere dearth of German working hands—and brains—must so profoundly affect the economic stability of the Continent as to make the anticipation of a quiet return to pre-war conditions impossible. Nor are the Germanic Powers alone thus affected. France, Belgium, Bulgaria, Servia, Montenegro will be in a like predicament; and, to a certain extent, Britain, Italy, Turkey, and Russia as well. If we turn to history for guidance in our prognostications, the only parallel which suggests itself is the visitation of the black death which ravaged Europe from east to west six centuries ago. The less intimate and less delicate, and therefore less vulnerable, international organisation of European social economy in the Middle Ages amply counterbalances the apparently greater magnitude of an older calamity. Froissart, in his *Chronicle*, sets down the proportion dead of the plague as one in three throughout all Christendom. Professor Tout, however, is of opinion that 'the wild exaggerations of the chroniclers reflect the horror and desolation wrought by the epidemic.' At all events, the number of deaths amongst women, children, aged, and sick must be deducted from the mortality estimates of the black death to make its immediate economical and social effects comparable with those to be expected from the present massacre and permanent disablement of the nations' youngest and most robust male workers.

The consequences of the medieval plague are lucidly discussed by Mr G. M. Trevelyan in his *England in the Age of Wycliffe*. For England they mainly amounted to a rise of the labouring and a fall of the possessing—that is, the landed and mercantile—classes, industry and finance being at that time too rudimentary to count seriously; and this readjustment of social relations was accompanied by a violent, destructive, ruinous, and lingering war of classes. Is the continent of

Europe to anticipate like disasters? This question is all the more serious, as there may be more even in a comparison of the visitation of the black death with the present crisis than the resulting destruction of labour power in both cases. Wars and rumours of wars had of old an ominous connection with famines and consequent pestilences. It is a commonplace to hold that there are for the Continent greater dangers than the bubonic plague of the fourteenth century; that modern hygiene is too advanced and modern comfort too general to allow the terrible plague a chance for development. This, indeed, may be so for France and Britain, taken as a whole. It is certain that a reasonable degree of general cleanliness constitutes no mean prophylactic against the introduction of the black death. Under normal social and sanitary conditions, moreover, it has, even when introduced, comparatively little chance of spreading beyond bounds. One would wish to be able to say as much with regard to the prevailing abnormal conditions on the one hand, and on the other with regard to the hygienic conditions of such countries as Russia, Austria, and Italy, not to mention Turkey and the Balkans. Even in ordinary times these countries are a constant menace to the Continent. At present the ever-increasing misery, destitution, and starvation of the bulk of the populations of some of these countries, in addition to the crowding together of important and representative sections of them into shifting encampments, under the most trying physical conditions, have increased this menace to a maximum.

Nor should it be forgotten that it is one thing to prevent the plague from entering a country, but quite another to force it out once it has definitely settled there. This the Dutch have learnt to their cost in their Malaysian colonies. It was soon after the great Chinese epidemic of black death which devastated Manchuria and the adjacent districts that the plague appeared in the island of Java. It is true that owing to the activity of the authorities it never reached to such terrifying developments as in China. Nevertheless, the Dutch have not succeeded in ridding themselves of the plague. After the abatement of its first virulence, it continues to demand a considerable toll of victims daily.

There is one bright spot in this otherwise dismal picture. Quite recently new methods have been invented which, though thus far only experimentally applied, seem to hold out a promise of definite and speedy victory. It is well worth while carefully to take into account these results, not only with a view to like conditions in India, but also in order to be prepared for untoward eventualities in Europe.

In 1911 the Dutch authorities began to wage war on the rats. By the million they were killed, but the plague remained stationary. Then active research in the laboratories brought out that the bacilli are not transmitted by rats, but by the fleas which live on the house rats. The field rat, therefore, was proved to be innocuous, and all the exterminative energy was forthwith concentrated on the domestic variety. This has become dependent on man for existence, and must breed in or close to human dwellings. Wherever in the huts of the natives there is a hole, wherever the smallest space remains vacant, the rats build their nests: on top of the ridge-poles, inside the bamboo posts, between the double walls of reeds, behind and even inside the fireplaces. At first fumigation was applied to infected houses; but the plague remained stationary, and even increased. For, as was discovered later, the sulphur-fumes did not kill nearly all the rats, many of which managed to escape to other dwellings, thus helping to spread the infection. At last, in 1914, the Government sent a famous and energetic bacteriologist, Dr Van Gorkom, and invested him with dictatorial power over all the infected provinces. This saved the situation. The plague dictator has thus far concentrated all his energy on the restricted area of Malang district in East Java. He began by ordering all the native dwellings to be reconstructed. With the assistance of the Salvation Army and the Red Cross, he organised for this purpose a well-drilled staff. The square ridge-poles of the huts were placed on their edge, and cemented up. The substitution of wood for bamboo was encouraged, the latter material only being permitted with cemented ends. In the walls latticed air-holes were made to let in the light. The fireplaces were also made of cement. The storage of food in closed chests and presses was made compulsory; and round the posts whereon the rice-sheds are raised tin discs were placed. Apart from all this, the nursing of the patients and the rigorous isolation of them

and their immediate surroundings were of course continued.

But it was not only necessary to improve the dwellings; they must also be kept free from rats, and must therefore be kept clean. This is the crucial point, especially in a tropical or subtropical country, where people live largely in the open, and home life is not valued. For this purpose the plague dictator has placed the dwellings, in groups of five hundred, under an inspector, and has instituted a weekly inspection. As everything in these native villages is ruled by *adat*—that is, not by *jus*, but by *mos*—it has been his aim to raise these inspections to the dignity of *adat*. Every improved house has been marked with a red figure on the outside, and on the inside a scroll of paper has been hung in a conspicuous place, where the inspector jots down his weekly observations. Besides, on inspection day every article of furniture must be placed outside the doors of the huts; and as even the apathetic natives of Java are not keen to expose their dirt to their neighbours' gaze, this has proved a marvellous inducement to cleanliness.

The results have not belied the efforts made. For the first eight months of 1915 the weekly toll of the black death in the Malang district was: 299, 206, 184, 169, 183, 209, 153, 182, 141, 129, 119, 80, 57, 43, 21, 55, 54, 27, 49, 46, 12, 19, 14, 13, 11, 5, 4, 3, 9, 10, 3, 4, 6, 7, 9. In the neighbouring district of Kediri, where the new methods have not yet been applied, these same figures were for the first half of 1915: 30, 28, 29, 45, 43, 48, 23, 32, 20, 29, 19, 23, 16, 13, 10, 13, 14, 15, 13, 19, 19, 35, 35. Here the black death is stationary, but for a temporary decrease during the hot, and a renewed increase with the beginning of the cool, monsoon. Malang does not show a like periodicity.

The Government of India will do well to ponder these figures, and the nations of Europe to remember against the evil day the practical achievements of the Dutch in their struggle with the black death.

THE WHITE FLAGS OF SAN SALVADOR.

CHAPTER III.

MEANWHILE feeling was running high on shore. The natives knew that Britain was at war with Germany, and knowing that San Salvador was near to certain German colonies in the Western Pacific, they were living in fear of an enemy raid upon the British coaling station in which they would be involved. This attack, every one was convinced, would come from the sea, and the arrival of the man-of-war following Schneider's flight—an accidental sequence of events—had confirmed this conviction. Then, later on, a report got about that scouts had been sent through the disused mountain pass to watch

for the enemy's ships on the opposite shore, and the news caused not only surprise but a change of opinion. Could an attack be made through that old avenue of approach? people were asking. Who would show the Germans the way? Not Schneider. He did not know it himself, however much he might suspect that such a pass existed. Takua had been mad enough—so the natives said—to risk his life to show the pass to Heriot; but he would never do this, and face the ghosts, to please the Germans, whom he hated, as Schneider's compatriots.

So the suggestion of an attack through the mountain pass was scouted by some, although there were others who asked pertinently, 'Why are the British sailors and marines making barbed iron-wire fences? And why are they digging trenches at the back of the coaling station?'

The following day the excitement rose to fever-heat. The pigeons that Takua had borrowed began to fly back to their old homes. They came one after another, with an interval of an hour or two between the arrival of the birds, and each carried a thread of different coloured cotton fastened round one of its legs. The natives who caught the pigeons said these badges must have a meaning; but no one on shore knew what this was. The instant the birds arrived they were taken to the man-of-war by the order of the captain.

A strong force of blue-jackets and marines, with the commander at their head and officers under him, landed from the man-of-war and mustered at the coaling station. The native guides were in attendance, and the party was joined by Heriot, who was followed by a big mongrel dog.

'I brought Jacko because I thought he might be useful to us as a watch,' Heriot explained. 'Schneider found him a capital guard.'

'Schneider!'

'Yes; but when Schneider bolted he left his dog to shift for himself, and Jacko came and attached himself to me. We've always been friends,' and Jacko, hearing himself discussed, put his nose into Heriot's hand. 'This is the rascal,' Heriot went on, 'who gave me away when I was trying to hide from Schneider. I told you about it.'

'Then we'll start,' said the commander.

Following the course of the river, the guides led the men inland, sometimes splashing along in the water, sometimes on its low muddy banks. The forest through which they were passing shrouded the route in gloom; but here and there shafts of light struck down through rifts in the canopy of leaves overhead and made bright patches on the marshy ground. After a few miles of this kind of advance the land began to ascend, the river to contract its banks and to become a torrent; and as the men pushed on they could see between the tree-tops, now less crowded together, that they were entering a valley, and that it was narrowing into a defile. The night closed in, but the moon rose behind the forest, filling the sky with an amber glow, and this was light enough for the keen-sighted guides; the sound of the torrent that they were following helped them also to keep their bearings. At length the full face of the moon soared over the tops of the trees and penetrated to the bottom of the gorge, which at the point the column had reached ran nearly east and west. The way was thus lighted for a considerable distance

ahead, till it was blocked, apparently by a mass of rock. This obstruction stretched across the whole width of the defile, and what looked like a narrow black pillar ran down the centre of it from top to bottom.

'That's the entrance to the Valley of the White Flags,' Heriot whispered to the commander. 'That dark vertical line is an opening in the rock.'

'It's a deuced queer spot,' was the answer. 'I don't wonder that these niggers funk it.'

'We've seen two Tindalos,' one of the guides whispered to Heriot. 'They are at the gate of the valley, and a white mist is waving over their heads. If we enter that place we shall all die. It's madness to go there with a full moon overhead.'

'There's something moving, sir, at the bottom of that opening,' a sailor reported to the commander, and every one took cover while the officers looked through their glasses.

'The ghosts are only our scouts,' Captain Barr said dryly. 'Tell those natives to advance.'

The scouts had much to say, but, being agitated, they could not speak coherently; and seeing themselves surrounded by white faces, they tried to express themselves in Pidgin-English.

'Plenty devil stop there,' one of the men gasped.

'Me no go on,' cried the other, 'but me hear man Ja Ja sing.'

'What does he mean by "man Ja Ja"? the commander asked irritably.

'Germans,' said Heriot; and turning to the scout, he asked him in his own language where the 'man Ja Ja' was.

'The Germans are on the far side of the ambush,' Heriot translated. 'The scouts heard them singing over their supper, and they took to their heels and rushed through the defile. At this exit they saw our men, and thinking that they might be shot as enemies, they pulled off their loin-cloths and waved them as signals.'

Leaving a guard outside the entrance to deal with runaways, the commander led his men into the valley. It resembled a long, narrow amphitheatre surrounded by lofty and almost perpendicular cliffs; the stream which the men had been following flowed down it lengthways, and had cut for itself a narrow opening at either extremity of the ellipse. The banks were flat and covered with rank grass, and at their broadest part of considerable width. The space within this great arena was lighted up as it would have been by day; but the dazzling brightness of the moon, and the quivering of the air from the heat radiated by the surrounding cliffs, made distant objects difficult to define with accuracy.

Terraces of rock stood out like steps on either side of the valley, and on these raised positions blue-jackets and marines were posted. They could direct a plunging fire upon a hostile force between them and below them, and they could

find ample cover for themselves behind the loose crags and boulders that had fallen from the heights above. Men were also placed at the river entrance to the valley and at its exit, to cut off the retreat of an enemy, or to stop his advance once he was trapped.

Hour by hour the sailors waited and watched, the quiet of the valley only broken by the babbling of the stream, which here and there flashed in the moonlight, and here and there lay hidden beneath the mist that was rising from the water.

Suddenly Jacko began to growl, and the commander turned his field-glasses on the dark lips of the fissure, through which the river came foaming and rushing into the valley.

'Tez,' he whispered to Jackson, the second in command, and he pointed to the direction in which he was looking. A couple of figures were emerging from the river entrance, and when they were clear of its shadows they began to take stock of their surroundings.

Satisfied, apparently, that the way was open, one of them waved a white flag, and a crowd of men came rushing into the moonlight. They were in the uniform of German sailors, and they advanced in column down the valley, some on one side of the river and some on the other. They had nearly reached a point midway between the sections of the British force, when a loud cry of terror came from their ranks, and a couple of nude figures rushed back towards the entrance to the defile. Some of the Germans started in pursuit of the fugitives, and a few shots were fired after them; and the British commander, fearing that his ambush would be discovered, was on the point of giving the signal to attack, when suddenly the loud and piteous howling of a dog startled both friends and foes. Jacko was scrambling up the cliffside, running for his life, and howling as he went along.

The Germans halted at this unexpected sound, and all eyes were turned in the direction whence it came. Then, as the moonlight was seen flashing upon a British bayonet, a sharp word of command was shouted, and the column made a half-turn and charged across the valley. As the Germans dashed forward they were met by a withering fire, and so bewildering were the echoes of the shots that the men advanced for forty or fifty yards before they realised that the bullets were coming at them from all sides. Then, as they dropped thick and fast, the column staggered and halted, uncertain whether to advance or retire.

'Cease firing!' the commander shouted; and when the bugle had sounded he said to his lieutenant, 'They are hoisting white flags, Jackson. Sing out to them in German, and tell them to throw down their arms, and order the officers to come and surrender to me.'

The British fire ceased, and Lieutenant Jackson left his shelter to obey the commander's

orders; but the Germans poured in a volley at him, and he fell, wounded, if not dead.

'Damn their white flags!' roared the commander. 'Give the treacherous brutes no quarter!' and again the rifles flashed and spluttered, and again the Germans made frantic rushes, now to this side of the valley, now to that, in a vain attempt to reach their sheltered enemies. At last a handful of survivors, following an officer, made a desperate effort to storm the terrace where they could see that the British commander had posted himself; but they dropped as they advanced, till only the officer was left on his feet. Seeing that he was alone, he drew a white handkerchief from his breast and waved it over his head; but the next moment he was down.

'Cease firing' was sounded once more, and the British force came out of their shelters. The silence of death filled the valley, though far away among the mountains the echoes of the rifles and of the bugle were rattling and ringing.

The commander went down to the officer who had last fallen, and, finding that he was alive, he tried to speak to him in German.

'Ich understand not,' the wounded man answered in broken English, and he looked at his enemy with a gaze full of hatred. 'But you von coward,' he cried fiercely; 'you shoot on ze vaite flag.'

'That's only half the truth,' the commander answered indignantly, and he spoke in English. 'Your men hoisted white flags, and I ordered an officer to tell you to come in and surrender, but you shot him.'

'Many of ze vaite flag?' cried the German. 'Ich understand not! Ve haf only von vaite flag for signal.'

'Come here, doctor,' the commander hailed to the ship's surgeon. 'You saw those white flags before I ordered the first "Cease firing"?'

'Certainly,' said the doctor. 'The Germans were waving white flags over their heads while they fired at Jackson. I'll swear to it.'

Then the commander put the same question to a sub-lieutenant and to a midshipman and to a couple of warrant officers, and they all made the same reply.

Heriot did not hear this inquiry. He was by the river, where he had gone for water for the wounded, and he was filling his bottle when there came a step behind him. 'Takua,' he cried, 'what brings you here?' and a flood of passionate words followed the question.

Takua said he had just loosed the last pigeon as the Germans landed on his shore. They seemed to know the place, for they pointed to the waterfall, and they beached their boats by the Pig's Head Rock. Then they seized him and one of his men, and made them act as their guides, threatening to shoot them if they refused to obey; but he led them as slowly as he dared, to allow time for the scouts to get home. The

men had to reach the pass by another way, for the Germans had set a watch to its approach by the waterfall. 'Never mind,' Takua cried excitedly. 'My grandfather promised me my revenge as we came along, and he has kept his word. Look at those bodies,' he went on; 'they cover the ground. Did you not see the white flags of death waving over their heads? When we entered this valley I saw a crowd of Tindalos advancing under their white veils upon the Ja Jas, and the sight of them was so terrible that I shrieked in agony. I could not help it, Heriot. And I and my man fled for our lives, and the Ja Jas pursued us and shot at us; but my grandfather saved us. He used your sailors' guns to destroy my enemies, while he waved his flags in triumph as they were shot down.'

'Your grandfather's flags?' began Heriot, in bewilderment, when a call from the commander stopped his question.

'Come here, Heriot,' he cried. 'Jackson is badly wounded, and he is the only one of my men who can speak German; but you can, and I want you to act as my interpreter.' When Heriot had run across the valley, the commander pointed to the German officer, who was supported in a sitting position by a couple of blue-jackets. 'Tell him this,' Barr went on. 'I ordered my bugler to sound "Cease firing" because his fellows had hoisted white flags. Then I ordered my lieutenant to speak to the Germans, and tell them to throw down their arms and come to me to surrender; but they fired a volley and wounded him. It was then I ordered no quarter to be given. Tell the man that, and make him understand it.'

'Are you sure about the white flags?' Heriot said, hesitating.

'Sure! Why, God bless my soul, man, of course I am! I'll swear I saw them, and so will half-a-dozen others. Won't you?'

'I'll swear I saw what you saw.'

'Then say what I've asked you to say.'

Heriot began to speak in German, but he stopped abruptly. The doctor, who had joined the group, whispered to the sailors who were supporting the body of the fallen officer, and they lowered it gently to the ground. The German was dead.

'He ordered his men to stab me with the knives they carry on their guns,' Takua said in Heriot's ear, and he pointed to the dead man. 'I loitered as I led the Ja Jas along the pass, for I knew the man-of-war must have time to set the ambush. I care not for these cuts—look at them—they are avenged;' and Takua turned round, showing his back. The sight made Heriot grind his teeth.

A sound of many voices was rising from the battlefield as the sick-bay orderlies and stretcher-bearers followed the doctor among the dead and wounded. Heriot was bending over a German sailor, speaking to him and giving him water, when he felt something soft and cold touch his ear. Jacko was by his side, and there was a wondrous depth of meaning in the dog's eyes, a language that every dog-lover can understand. He whimpered softly, wagging his tail and moving slowly away. Heriot rose from his knees and followed the dog, and in a few paces they were beside a dead man, whose helpless hands Jacko began to lick. It was Schneider.

'The ghosts of my forefathers are satisfied,' said Takua, and there was a tone of relief as well as a note of triumph in his voice. 'See!' he cried, pointing to right and left. 'The Tindalos have departed.'

The snowy films of cloud that had been rising from the river and floating hither and thither like quivering veils of gossamer had all disappeared. The valley was clear of mist from end to end. The White Flags of San Salvador had vanished into thin air.

THE END.

SALMON ANECDOTES.

By H. A. BRYDEN.

SIR WALTER SCOTT once described himself as 'no fisher, but a well-wisher to the game.' Scott may not himself have been a great angler; but he knew all the minutiae of the sport, and was familiar with the habits of the fish, as indeed he ought to have been, considering that he lived on the banks of Tweed, one of the finest salmon-rivers in Britain. He was well acquainted with the ancient Scottish method of 'leistering,' or 'burning the water,' a form of night sport now regarded as poaching pure and simple. In this method a torch or fire-grate was used to attract the fish, which were secured with a spear or a barbed fork or trident.

Scott's friend Skene has written of some of their experiences in this sport, which he describes as 'not without its hazard.' 'If the spear-thrust is missed,' says Skene, 'the fisher finds himself launched with corresponding vehemence heels over head into the water, the fish and spear both gone, the light thrown out of the grate by the concussion given to the boat and quenched by the stream, while the boat itself recedes perhaps beyond his reach.' On one of these night adventures Scott went overboard, and was hauled out by Skene, who grabbed him by the pocket of his coat. Scott gives a fine and graphic description of salmon-fishing by 'burning the water' in his novel *Guy Mannering*, wherein

he describes a phase of that sport on the river Esk.

In the old days, when salmon-fishing as a sport was in its infancy, all sorts of methods now looked upon as illegal were resorted to for the purpose of killing fish and obtaining food. I myself can remember, in the 'seventies, at the Falls of Tummel in Perthshire, that long, huge, shallow baskets or creels, big enough to cover a man, were hung below the falls, so as to catch the salmon as they fell back in their usually fruitless attempts to leap this magnificent cataract. Now and again a fish did actually accomplish this seemingly impossible feat; and in the year 1878, when trout-fishing on Loch Tummel, I well remember a brother-angler staying at the same inn hooking and eventually landing a nineteen-pound salmon on a light trout-rod. This was a really notable feat, which occupied some hours in the accomplishment. For an hour the salmon sulked at the bottom of the loch, and refused to be stirred by any known method. I believe the Falls of Tummel have now been provided with a proper pass, by which salmon can more readily attain the loch above.

Many years ago, at a fall on the river Beaul, salmon, on their journey up, often mistook their direction, and leaped on to a large jutting rock. In those days the country-people were in the habit of laying branches at this spot, so that the fish could not make their way to the water again, and were captured. In this way as many as a score of salmon were taken in a single morning during a big run of fish. The Lord Lovat of that day once made a curious experiment here. He had a fire made on the rock, and upon it placed a huge iron pot. Into this a salmon presently jumped, and was speedily boiled and eaten. 'This was done,' says the chronicler, 'that his lordship might be enabled to boast in the south of the wonders that existed in the Highlands, which were then little known, and to say that in this country provisions abounded so much that if a fire was made and a pot set to boil on the banks of the river, the salmon would of themselves leap into the pot to be boiled, without requiring to be caught by a fisherman.'

The muscular strength of salmon must be enormous to enable them to perform the mighty leaps which they so frequently accomplish on their way up to the spawning-grounds. Not only do they propel themselves to a considerable height in these wonderful jumps; but it is to be remembered that they are at the same time opposing an enormous volume of water which pours over the falls on its way to the sea. The leaps of salmon sometimes take them into yet stranger situations than the Beaul Falls rock. Only a year or two since, while angling on the Grandtully Castle water of the Tay, the fishing tenant was working from a boat, in which were

also the head keeper and another. They were in mid-stream, when a large salmon suddenly took a leap out of the river, came over the stern, and landed at the bottom of the boat. It was a very powerful, fresh-run fish of twenty-one pounds, and was secured with some difficulty, as may well be imagined. This fish was not hooked, and came into the boat by a pure mischance.

A somewhat similar accident happened some nine years ago on another river. A little girl walking along the bank heard a thudding noise which came from a boat. 'Peeping fearfully over the gunwale, she was saluted by the powerful flop of a great silvery fish, and ran for her life to the riverside inn, where she was taken for one demented.' The fish, a salmon of course, was secured by the owner of the boat, whose family were thereby enriched to the extent of two pounds by the value of this unexpected capture. History does not record what the little girl got out of this strange transaction!

Salmon, when fresh from the salt water, are constantly endeavouring to rid themselves of the sea-lice which have attached themselves to their silvery bodies, and which do undoubtedly torment them a good deal. Mr H. R. Laing, who had for many years the famous salmon and sea-trout fisheries at Costello, on the Galway coast, considered that much of the deterioration of salmon was due to the fact that from morning to night they were continually leaping to get rid of the sea-lice, and scraping themselves against the rocks at the bottom of the sea. 'In one very dry year,' he says, 'we found over one hundred dead fish on the shore. I saw no signs of disease, only a mass of scars caused by rubbing against rocks to get rid of the sea-lice.'

Methods of salmon-catching, as we have seen in some of the above examples, vary a good deal. A writer in the *Field* described a few years since, with some humour, how a certain sailorman captured one of these fish in a port near which a salmon-river becomes an estuary. 'A man-of-war was lying in the roadstead, and one of her seamen was on shore looking over the bridge, where hundreds of grilse were visible. He went down to the river, took off his boots and socks, and, picking up a big stone, waded in. He had previously spotted a big fish, and with a good aim killed him dead with the stone, picked him up by the tail, and walked triumphantly out of the river. The bailiff then came on the scene, and asked him what he meant by killing the fish. Jack said, "What the —— has that got to do with you?" The bailiff proceeded to explain that he was poaching, and liable to imprisonment. Jack listened attentively, and then said, "Why, you silly ——, do you think I am going to see all those fish in the river, and not take one on board for our mess?" The owner of the fishing was so amused at the whole thing—Jack, of course, not realising

that he was doing anything wrong—that he let him have the fish, which he took on board, to the great delight of himself and his messmates.’

The poaching spirit is probably more abroad in Ireland than in any other part of the British Isles, and lawlessness in pursuit of sport seems to be part and parcel of the Irish native. But for this fact many a good natural fishing would abound in salmon, and many a wild Irish mountain would teem with grouse, returning all of them excellent rentals to their owners, and supporting keepers, understrappers, and local tradesmen in comfortable livelihoods. The Irish cannot, or will not, see this; and their poaching habits simply destroy year after year good sources of income which would help to enrich many a small farmer. Poaching is in the blood, and I suppose always has been and always will be.

I was once witness of a curious but characteristic scene, common enough in the sister isle. It was on the banks of a well-known salmon-river, let out to a limited number of rod-fishermen. One of the ‘rods’ had come down with a ‘Saxon’ friend, who was going away in half-an-hour or so from the neighbouring station, bound for England. He wanted a salmon for the Saxon guest, but the salmon just then were uncoaxable, impervious to fly, prawn, or any other legitimate lure. This fact seemed to trouble the Irish ‘rod’ very little. There was a brief consultation with the local professional fisherman, the paid custodian of the stretch of river, be it remembered, and a salmon was quickly forthcoming. Taking the legitimate lure off his line, two or three large stout hooks on a gimp trace were fastened by the professional to the line; a heavyish piece of lead completed the tackle. With this murderous-looking gear the conspirators at once proceeded to select a sizeable salmon. The river here was shallow, and you could see the dark backs of scores of fish lying near the bottom, waiting for a freshet of rain before going up higher. The prey being selected, the professional threw his unbaited hooks over the salmon’s back and jerked the line violently toward him. Twice he failed, and the fish moved away. At the third attempt he managed to strike his victim, and after a stiff contest—for the fish was foul-hooked in the back—got it ashore and had it gaffed, a nice fish of about fourteen pounds. The Saxon got away with his plunder, and caught his train, pondering no doubt on the extraordinary facets of Irish character. This was a preserved fishery, remember, bringing in quite a good rental. This method of poaching, well known all over Ireland, is termed ‘stroke-hauling.’ With the strong tackle used, only the very heaviest salmon, fish of over twenty pounds or twenty-five pounds, have a chance. It is a murderous and detestable practice.

But even in orderly Scotland, and upon the

classic Tweed, poaching is by no means unknown. A few years since an eye-witness wrote an account of some proceedings on that river which had occurred in broad daylight, during a big run of fish. Two men cleeked and landed a fine salmon of thirty pounds before a crowd of spectators. The cleek consisted of a large hook fastened either to a stick or to a piece of string attached to a stick. This feat was accomplished within two hundred yards of two water-bailiffs, at that time engaged in an afternoon smoke, only a screen of willow-branches separating them from the poachers. About this time a clever fox-terrier, belonging to a well-known poacher, was constantly employed in the same nefarious business. Its method was to sit on a stone in the river and watch for fish. Whenever a salmon appeared the terrier seized it by the tail or a fin, and, although not strong enough to capture and retrieve its prey unaided, managed to hold on until its owner could get down to its assistance. ‘Within a short space of time the dog was seen to catch two fish in this manner, and one could readily see by the excited state of the animal that it had been trained for the purpose.’

Salmon-fishermen, whether with nets or rods, meet occasionally with fatal accidents while in pursuit of their business or sport. A rodsman wading in a rushing and tumultuous river, maintaining an uncertain foothold on slippery stones, and encumbered with waders and heavy brogues, is not seldom in peril of his life. In the excitement of the sport he forgets his danger, and finds himself in extremely perilous situations. If he gets down, the water quickly fills his wading-trousers, and he is lost. He can seldom regain a foothold, and is swept away and drowned. A number of first-rate sportsmen have met their death in this manner. Even the netsmen, fishing from a boat, run occasional risks with heavy fish. A few seasons since, two brothers were netting salmon in a boat on the Suir, near Mooncoin, County Kilkenny. They had enclosed a big fish. In the desperate struggle that ensued—the salmon was a forty-pounder—the boat was upset, and one of the brothers sank at once and was drowned, while the other was with difficulty rescued by boats from the shore. The salmon was saved also; but, at the price of a man’s life, it was a dear bargain.

Salmon, as I have shown, have been taken in all sorts of odd ways; but never, I suppose, was one of these strong and plucky fish killed with a feebler or more absurd instrument than one captured four years since in a Welsh river. It was close to Rhayader Bridge, on the Wye, in Radnorshire. A lad, using a sixpenny rod, a pennyworth of line, and a worm as lure, managed to hook a nine-pound salmon just below the bridge. The salmon, after a brief struggle, wrested line and rod from the boy’s hands, and then tried to get rid of its burden. A crowd collected, and one of the men presently got hold

of the rod, and managed to overcome the now tiring fish, which was eventually safely landed. It seems incredible, but the incident is a well-established fact.

The salmon possesses a terrible enemy in the seal, which pursues and devours these goodly fish in many a river and estuary. Until a few years ago the estuary of the Tay, the finest of all Scottish salmon-rivers, was mercilessly harried by these sea mammals, and both rods-men and netsmen found in the mutilated fish which they captured ample evidence of the ravages of the marauding seals. Until the year 1900 it was computed that some twelve hundred seals haunted the Tay estuary. The herd lay at the mouth of the river, and could be seen at low tide spread about over a mile of sandbanks. As the tide rose, they swam up the river as far even as Perth, attacking the salmon in the open water and in the nets. The damage they did to the nets was very great, and the fishermen computed that the seals killed four salmon to one taken by the netsmen. Seals have enormous appetites, and a single specimen, when cut open, was found to contain thirty-six pounds of salmon in large lumps. The evil attained such proportions that at length strong measures of warfare were adopted. A small steam-vessel, its crew armed with three Mannlicher rifles and two shot-guns, was employed in the campaign, and at the end of the first season one hundred and forty of the marauders had been slain. In 1910, as the result of ten years' hunting, the herd of twelve hundred had been reduced to about sixty seals, which had become so shy and cunning that they seldom gave the chance of a shot. The number of salmon marked by seal-bites now taken in the nets has been enormously reduced, and the nuisance has for the time being been brought within manageable proportions.

Odd finds are occasionally met with in the stomachs of captured salmon. In 1909 an Inverness-shire grilse of eleven pounds, when cut open, was found to contain an iron key three inches long. In the same year was recovered from the interior of a salmon of seven pounds a bricklayer's chisel weighing half-a-pound.

The growth of the salmon in its early stages is very remarkable. This feature of the life of *salmonidæ* has long occupied the attention of experts, and its full history would occupy a very large volume. Space for one or two illustrations only can be found here. A salmon smolt, when marked for the purpose of identification, will measure some five inches in length. These fish return from the sea to the river as grilse. In 1907 Mr P. D. Malloch, managing director of the Tay Salmon-Fisheries Company, stated that grilse previously marked as smolts had, after a sojourn in the sea of twenty-one months, returned to the river, and been captured. Three of these weighed respectively nine and a half pounds, nine pounds, and eight pounds. In the previous

year (1906) smolts marked in 1905 had returned to the river, some of them scaling up to ten pounds in weight, an even more wonderful rate of increase. In August 1898 the present Duke of Richmond and Gordon, then Earl of March, reported the capture of a twenty-five-pound salmon, taken in the nets on the Gordon Castle water of the Spey. This salmon had been marked as a kelt, or spent fish, in the spring of the same year, when it scaled no more than twelve pounds. In five months it had, therefore, thanks to its journey to the sea, more than doubled its weight!

When one realises the immense muscular power of the salmon, it is wonderful that man, with the apparently feeble aids of a slender, tapering rod and a thin line, should be able to conquer so powerful an opponent in its own element. A heavy salmon of, say, fifty pounds is about a third of the weight of a good-sized man. Yet fish of this weight are occasionally killed with rod and line. The heaviest salmon taken with the rod in the river Tay in 1899, for example, was a fish of fifty-three pounds, which Lord Campbell of Blythwood had the good fortune to bring to bank. In 1907 Mr Henry Willis, fishing in the Olden River, Nordfjord, Norway, killed with rod and line a magnificent salmon of sixty-two pounds. It is remarkable that this great fish was conquered and landed in the short space of fifteen minutes. A couple of hours would not have seemed too long for the battle with such a monster. Some few years since a plucky angler, hooking a big salmon late in the evening, had to play it all night, and was rewarded in the early hours of the morning, when thoroughly worn out and exhausted, by achieving its capture. One of the heaviest, if not the heaviest, salmon ever killed by a rodsman was a leviathan of seventy pounds, captured in 1896 by Sir Richard Musgrave in the Campbell River, British Columbia.

The playing and landing of these great fish entail very severe muscular exertion and much staying-power; and the victor in such contests may well congratulate himself on successfully coming through so strenuous an ordeal.

PEACE AFTER WAR.

WHEN ancient Rome a mighty Empire grew,
To all the known world gave her law exact,
Could spare the conquered and the proud subdue,
The Roman Peace was fact.

Where'er the British flag flies out supreme
Freedom and order wondrous growth attain,
And, e'en in lands where other races teem,
The British Peace doth reign.

When right (with might) has vanquished monstrous
might,
When general law has made injustice cease
By latent force; then, like day after night,
Shall come the world-wide Peace.

C. O. OVINGTON.

Chambers's Journal

SEVENTH SERIES

UNCLE OBADIAH'S FOLLY.

By CHARLES EDWARDES.

'14 PRIESTS' LANE, HOLBORN, W.C.

'DEAR UNCLE,—I am writing to tell you that I hope to be married very shortly.' . . .

'Eh! what's this?' rapped out Mr Obadiah Prince, the 'dear uncle' of the letter, with the kind of frown and lip-convulsion combined that only the boldest or the youngest of his shop-assistants could face without a tremor. A cuckoo was calling from one of the high trees at the back of his lawn, and he looked sharply through the window in its direction. Then he read on.

'Her name is Miss Louie Strange; though, of course, that does not tell you much. We have seen a good deal of each other in the past six months, and you will be glad to know that mother likes her. This is a great comfort to both of us. I trust that you will not consider that we are imprudent in taking such an important step before I am in what you would consider a position to marry; but we both agree that a wife is a help to a young man in his battle with the world, and not necessarily a depressing burden on his back.' . . .

'God bless my soul! The lad's an idiot!' shouted the uncle at this point. He crushed the letter in his hard, short-fingered little hand, made a ball of it, and hurled it at the tea-pot. It was a fair shot, and from the tea-pot it cannoned into the dish of fried bacon, where it settled down comfortably.

The parlour door opened.

'Were you calling me, sir?' inquired Miss Sipcot, Obadiah's staid, elderly, and very discreet housekeeper. But even while she spoke she saw the mishap to the bacon, and believed that she understood. 'I will do you a little more, sir,' she said in a tone of respectful soothing as she approached the table.

She had been with Mr Prince, and his mother before him, for nearly thirty years, and had never seen Obadiah look so savage about a trifle. But she believed she understood this also. He had lately been annoyed by gout and certain other inside troubles, poor man; and when one has gout, molehills become mountains.

Obadiah rose and stood with his back to the fire, feet well apart—an imposing attitude.

'You may set that down again, Maggie Sipcot. I sha'n't want it,' he said.

'Why, sir—what's the matter?' asked Miss No. 277.—VOL. VI.

Sipcot concernedly. There was subdued menace in his tone and looks, short man though he was, and bald-headed.

'Matter!' Obadiah let himself go. He hurled the word at her as if it were a duplicate of the crushed letter. Then he broke into a storm of nods and strode at her. 'Here, come with me and be a witness of what I am about to do,' he said, with a sinister smile.

His hand fell on her arm like a small sledge-hammer. It was aimed at her shoulder, but she was too tall for that. It slipped away, and, nodding repeatedly, the owner of the great drapery establishment of Prince, Limited (ninety yards frontage in a principal street), marched his inches past her swellingly, across the hall, into another room, of which a clumsy, old-fashioned mahogany writing-table which had belonged to his grandfather was the chief article of furniture. The room was known as the library, although its bookshelves held nothing but ledgers—astrenuous lifetime's record of business profits and losses.

His face was now carmine with agitation.

'I'll teach him to do a thing like that without consulting me,' he exclaimed, as he fumbled in his pocket for his keys.

Miss Sipcot stood anxiously in the background. It was a situation without parallel in her experience of that methodical house. Mr Prince was sometimes very cross (he even swore occasionally), but she had never known him get up from his breakfast like this. His hand shook as he unlocked a drawer—the drawer, in fact, as Miss Sipcot was quick to observe, containing his will in a long blue envelope. Miss Sipcot knew as much about this as it had pleased him to tell her—namely, that she was down in it for five hundred pounds and all the furniture, but not the silver. The silver was to go to his widowed sister in London, Mrs Grey, the mother of the impudent young man who, it appeared, hoped to be married shortly, whether he (Obadiah) liked the young woman or not.

'Strike a match for me and come this way,' said Mr Prince harshly.

It was a tragic command, but Miss Sipcot obeyed him. He tore the will into four strips, envelope and all, held them to the lighted match in Miss Sipcot's sacrificial hand, and finally tossed the bouquet of flames into the grate.

[All Rights Reserved.]

MARCH 18, 1916.

'There!' he bellowed, as if comforted at last. 'You've seen me do it, and I'll leave every penny to charities. You may go away now. I'm taking the ten o'clock train to London, but I shall be back this evening. Don't argue with me, or I shall lose my temper. It's the most ungrateful world I've ever had anything to do with. Tell Meeson to get the car out immediately. I am waiting for it, tell him. I shall call at the shop on my way to the station. That's all. I must get my boots on.'

Argue with him! As if any one who knew him were ever likely to do that! But, shocked though she was, Miss Sipcot did make one brave effort to remind him about his uneaten breakfast and the bacon which she would quickly replace. She even ventured to say that his health would suffer if he went out with an empty stomach.

'Confound the bacon! And I don't care whether I suffer or not. Just do as I bid you,' he thundered, after listening to her with evident impatience and worse.

She went, with a bowed head; and three minutes later Obadiah was in the car, with a purple-and-white wool wrapper to his neck, and well overcoated for the three hours' May-day journey to town.

He spent a few violent minutes at the shop, and left Mr Keene, his general manager, whom he had cherished from the time he was a shop-boy, almost as upset in spirit as Miss Sipcot.

'Like as not, Tom Keene,' he said, 'I shall dispose of my business in town in the course of the day, or at any rate see the agents about putting it on the market. You may just as well be prepared. I have excellent reasons for such a proceeding, but they have nothing to do with you. Good-morning, Tom.'

Little wonder that Mr Keene whispered to himself as he stared after Mr Prince, 'The poor old governor must be off his head!' when Obadiah charged away after this harrowing communication. And none of his young ladies dared do more than glance at him as his red countenance passed between their counters, like a flaming bomb ready to explode again at any moment.

For the first hour or so of the journey the old gentleman did little but fume. He had a first-class compartment to himself, and the solitude gave him a satisfying opportunity of telling the scenery photographs opposite to him, and the outside landscape whenever his glance wandered thither, what he thought about Lancelot Grey, his nephew. He said things also about Mary Grey, his sister, the independent young fool's mother. It almost served Mary right. It was Time's revenge upon her for distressing him (Obadiah) and their mother, with whom they both then lived a life of extreme regularity, by running away five-and-twenty years ago with a certain other young fool whose only aids to matrimony, so far as Obadiah could then see,

were a conceited strut and the mad belief that he would always be able to earn ten pounds a week as an actor. That was what he was—a Hamlet, an Othello, or a Romeo, night after night—and similar nonsense, until he died of too much whisky. He despised drapers, even drapers in a large way—at least he gave Obadiah that impression—just as much as Obadiah scorned stage players. And he left nothing to his widow except some debts and a three-year-old boy. The widow and the boy had lived on Obadiah's pocket ever since. Obadiah wanted the boy in the shop when he was sixteen, but the boy wouldn't think of it. He was a perfect specimen of a romantic Lancelot (such a name to put upon a lad, instead of honest John, James, or Obadiah!), and had taken to art. Obadiah had given him a grudging hundred pounds a year to help him to paint pictures that might sell, and this was the result! The ungrateful son of a discreditable father had got himself engaged to Heaven-only-could-tell what kind of a designing young female, and intended to marry her without a single previous 'By your leave' to him. And he proposed to support himself, this wife, and no doubt children, who would be sure to come fast enough, on his allowance of one hundred pounds per annum and nothing more, so far as Obadiah knew.

Mr Prince commented upon the situation loudly and forcibly while the train hurried him to town, and for an hour did not feel even the least inclination to smoke.

At length he wearied and lit a cigar, which disagreed with him because of his empty stomach. He opened the window and threw away the cigar, then folded his arms and gloomed stolidly with a growing sense of physical weariness, which, perhaps mercifully, ended in slumber. He was snoring like a pig in a nightmare when the ticket-collector roused him at Willesden Junction.

Here, but not until the official urged him to do so, he alighted. He seemed hazy about things. He had forgotten that he had booked to Willesden only, meaning to settle during the journey whether he would first pour out some of his wrath upon his sister at Highgate, or take it all direct to Priests' Lane and the young man.

The ticket-collector's intimation that he might catch an immediate train for Highgate seemed to clear his brain.

'Up the steps, sir. But you must look sharp,' said the man.

At sixty-four, important persons like Obadiah do not care to be hustled by any one except themselves—particularly when disagreeably conscious of a quite empty stomach.

But Obadiah submitted, and caught the North London train, feeling—as one of his young ladies might have expressed it—absolutely rotten. An exasperated mind, a leaden, fluttering heart, panting lungs, and a general sense of exhaustion, all helped to make the short further journey to

Highgate a miserable experience. He realised now and then that it was largely his own fault, because he had eaten nothing; but this fact, of course, only irritated him the more—for the wounds we give ourselves are bad to heal, as Shakespeare reminds us. It was so seldom that he had just cause to blame himself for anything. Other people made mistakes, but not he.

However, he would soon get some food in the Caxton Road, where his sister lived very snugly, at his expense. He would say little until he had eaten. Afterwards there would be much to say. And when he had made Mary cry as she deserved to cry for having married such a husband as the late Hamlet fellow, and for having given him (Obadiah) such a thankless nephew as this Lancelot, he would go on to Priests' Lane and administer some shocks to Lancelot, and—this was the cheering gist—particularly inform that young man that he might expect no more money per annum from him, and nothing at all after his death. The threat to Tom Keene about selling the drapery business could then be taken seriously into consideration, if he still felt so disposed.

He drove in a taxi to Caxton Road. Some cold meat and salad (Mary made excellent salads), and a glass or two of wine—of these he had bright visions on the way.

But the bright visions did not materialise. A pert little blue-eyed minx, with untidy hair, a smudged nose, and no cap, barred the way when he would have stepped in without a word, as his autocratic manner was on these Highgate visits.

'Here, what do you want?' she challenged him, making two acute-angled triangles of her young arms to fill the doorspace.

'What do I want?' Obadiah looked her up and down, and coldly mentioned his sister's name.

'She's not in, nor she won't be till ever so late,' announced the girl as if she were very glad about it.

Continuing to eye her with plain disfavour, Obadiah said 'Indeed?' very huskily. Disappointment added nothing attractive to the effect of his previous indignation. 'I am Mr Prince.'

'Prince! All right. I'll tell her you've called,' said the girl, letting her arms' triangles fall to pieces and turning away.

'You'll tell her I've called!' echoed Obadiah with a slow smile of bitterest irony which gave his countenance a fresh kind of ugliness. 'That's extremely obliging of you, I'm sure.'

The girl liked neither his smile nor his irony. She was new to the Caxton Road and the metropolis, and her mistress had, very wisely, told her to be suspicious of strange callers, especially in her absence, and to behave accordingly. She determined to end the interview.

'You'd better come again,' she said. 'Sorry I can't stand here any longer. I've other things to do.' And the door was shut, not at all gently, in Obadiah's convulsing face.

It was a reeling world then to the old gentleman for about a minute. He drew many short breaths before his shattered mind could decide what next to do. An absurd youthful impulse to dash his gloved fists through the glass door-panels and so force his way in was successfully overcome. Opprobrious epithets suitable for such a hussy, whose wages came out of his pocket, trembled on his tongue unuttered. Cruelly unkind thoughts about his sister Mary and her future income rushed to and fro in his brain. He gripped his umbrella as if to use it against an enemy. And still thus clutching it, half-raised as though to strike, he at length tottered away.

His principal desire in life now was to get at his nephew as quickly as possible. His resentments all settled again upon this first cause of his pangs of that day. His bodily hunger was no longer insistent. It was his mind's passion that craved a full meal now, not his stomach. Neither Mary nor the boy should touch another penny of his money after the next quarter-day. They were both to blame, but he by far the more; and a nice young fool he would be bound to look when Obadiah startled him with the intelligence that from the beginning of July he would have his mother to keep as well as himself. Not much room in such a programme for the wife he hoped to marry shortly.

Obadiah tottered on. The Caxton Road was a quiet residential byway out of a main street. He did not know what an odd figure he cut. He glared grimly and gaspingly in front of him, and his short, quick steps were taken at an inclination which seemed to threaten him with a collapse upon his angry old face at any moment. But in the Caxton Road there was no one to notice him; and he reached the busy main street at the end of the road without even the stare of a butcher-boy to do what it could to inform him that he was no ordinary object.

Here a policeman by a lamp-post gave him just the one cue for his further movements that he needed.

He jolted heavily against the man's arm, which, with official instinct, at once proceeded to sustain him.

'A cab—a car—anything, officer!' Obadiah stammered.

'What's wrong, sir?' he was asked immediately.

'Get me a cab or a car—Holborn—Priests' Lane, No. 14. I—I——' Obadiah made a noise in his throat which might have been an attempt to laugh. 'D'ye hear me, man?' he whispered, with a grimace of anxiety.

'I see, sir,' said the man. He drew his own conclusions about Obadiah's red face, struggling speech, disinclination to stand without support, and almost dead-weight. 'All right, sir.' He blew his whistle. 'You're not well, sir.'

'That's a lie. Quite well. Never better,' Obadiah retorted with a last gasp of energy.

But it was Obadiah who was telling a lie, and he knew it dimly. He knew little else, however, and showed no interest in the small crowd which assembled, and smiled to see him hoisted and tipped into a second taxi.

'What address did you say, sir?' the youthful policeman asked coaxingly when Obadiah was seated in the car, and, with his tall hat tilted well back from his now vacant-eyed face, looked the very complete ideal of an old gentleman who had had some drops too much, and was likely to be worse ere he was better.

The question was repeated; then answered, very feebly: 'Nephew, Grey—Lance Grey—14 Priests' Lane, Holborn, London.'

He tried to say something else, but the constable had heard enough. The driver received his instructions, winks were exchanged, and Obadiah sank lower into his corner at the first glide of the car.

And then gradually a generous oblivion took complete charge of him. And even as he had been spared the shock of perceiving that he was a source of amusement to those Highgate idlers, he was saved also from the pain of seeing his removal from the taxi to his nephew's quarters in Priests' Lane as others saw it.

It was quite a business. The car could not get into that narrow alleyway of old dwellings; but, after inquiry at No. 14, helping hands bore Obadiah down the passage and up the Elizabethan stairs to Lancelot's sitting-room on the second floor. There they left him. And there, not long afterwards, he opened his eyes, stared at the ceiling, turned his head and blinked at a bright fire very near to him, and then realised that he was extended upon a comfortable sofa, with a green-and-red tartan plaid covering him chest-high.

From the plaid his gaze roamed beyond to the windowed side of the room, thence to a bookcase in the corner between the window and the fireplace, and so on to an oil-painting over the hearth. It was the portrait (head and shoulders) of an elderly gentleman with a fine resolute face, and he was held fast by it when a footstep heralded the approach of a very different kind of face.

'Oh, I'm so glad you're better, Mr Prince!' cried a sweet and cheery voice; and Obadiah found himself looking up at as pretty a girl as he had ever seen in his long life as an employer of girls, pretty and otherwise.

'Yes, that you are!' said this pretty girl after brisk inspection of him. 'How splendid! But you mustn't be in any hurry to stir until you have had something. Can you fancy a little cup of beef-juice as a start, Mr Prince?' she nodded encouragingly. 'You *must*,' she added.

She flitted away, and Obadiah's attention reverted to the portrait. It absorbed him, this painting. He had never even imagined himself

like that; but was it possible that to others he was so handsome and striking an individual?

The idea was strangely, keenly stimulating.

A smile stole to his lips, and was lingering there when the pretty girl returned with a tray. She sank down gracefully with it between him and the fire. A steaming little cup, a plate of exquisitely neat sandwiches, a small bottle of champagne—Obadiah saw these charms in her lap in this sweet attitude, and then took in thus closely her own charms of face.

'My nephew, Mr Grey—where'—— he began.

But she wouldn't have it.

'You shall hear about everything *after*—not before, Mr Prince,' she interrupted. 'I'm going to feed you a spoonful at a time. Please let me. You may sit up after the soup. I believe it's want of food, and nothing else, that has made you faint. Now—please!'

But neither would he have this—yet. He awkwardly levered himself into a sitting posture.

'Do you mean to tell me that I have fainted?' he blurted.

'Yes; and you must lie down again at once, Mr Prince,' said the pretty girl reprovingly. 'It's so *naughty* of you. I am a qualified nurse, and I know all about it. Now do be sensible!'

'A—qualified nurse!' Obadiah gasped the words. He seemed incredulous as well as shocked, but yielded to the gentle persuasion of her hand. She rearranged the cushions under his head, and then administered the first spoonful of beef-juice.

Other spoonfuls followed. He was a subdued old gentleman during the process, but gulped the fluid with increasing eagerness, and an increasing interest in the pretty girl's smiles and approving nods. And then she set him on a new tack of interest.

'Didn't I tell you?' she asked. 'It's just simple hunger. I was sure of it. I've felt like fainting myself when I've been without food for too many hours.'

'Good heavens, child!' exclaimed Obadiah. 'How did you know that?' She looked so young as well as pretty thus dimpling at him above the spoon. The word 'child' burst forth without thought. And he sat up after it so smartly, and looked so obstinate and strong now that she no longer opposed him.

She rose instead. 'I shall set a little table here, Mr Prince; so don't move,' she said.

He was gazing at his portrait again when she brought the table.

'I should have recognised you from *that*, even if I had not expected you,' she told him.

'Recognised—expected! *You* expected me?' murmured Obadiah, looking amiably bewildered.

'Yes, because of the telegram that some one named Sipcot sent two or three hours ago. It said you had had no breakfast this morning. I'm so glad I opened it; but it was an appalling shock at first when those men had to *carry* you

in. I'd got a real nice little dinner ready for you, though I say it myself; but I mustn't talk like this yet. Lance says you hate chatterboxes. He and his mother are at Wimbledon trying to find a little house for us, but they'll be back about tea-time. Now then.'

She arranged the table in front of him, and was about to cover his knees with a napkin; but he gently pushed this away, and stood up crowded with emotions.

'Then *you*'—he whispered.

The pretty girl nodded, smiling and dimpling. 'Please don't be angry with me, Mr Prince,' she pleaded thus archly. 'Lance says you are certain to be—with both of us; but why should you be? I'm going to make him ever such a good wife. But, anyway, you are not to worry about it yet. You *must* eat something. Can you drink champagne, sir?'

'Champagne!' Obadiah tried to be severe, but somehow it didn't come off.

'Oh, I know what you think, Mr Prince!' she exclaimed quickly. 'It is extravagant; but I bought it for you out of my own pocket after the telegram this morning. I thought it would do you good. Besides, Lance's luck yesterday that he told you about'—

'His *what*?' cried Obadiah with a new effort of sternness. '*Luck*, you call it?'

'Why, of course it was, Mr Prince,' said the pretty girl, opening her sunny eyes wide at him. 'A hundred guineas for a portrait he can do perfectly well in a fortnight! And he says it's bound to lead to others. There are such a lot of rich aldermen in the City, and Sir Peter Whicker is sure to show it to his friends, and then they'll want to be done too. He was so taken with yours there, Mr Prince. He said—But I mustn't tell you what he said; it's so flattering to you and Lance. All he wants is as pleasing and truthful a work of art as that one. He said it looked so natural that it was certain to be truthful as well. And so it is. You're just like that. I should have known you anywhere. But how astonished you seem! It was in the postscript to Lance's letter. Didn't you read it?'

Obadiah sat down. His thoughts were too conflicting for clear speech. With his chin and his right cheek in his hand, he listened to a little more of the pretty girl's soothing chatter; watched her bring the tray to the small table; and only then, when she paused and glanced at him with sweet invitation in her eyes, did he know fully what he ought to do. He rose and said, 'I believe your name is Louie, my dear?'

'Yes, Mr Prince. How nice of you to remember!' she answered eagerly, looking prettier than ever.

And then, making an impressive business of it, he took her face in his hands and kissed her.

'We must look at the best side of things, my dear Louie, that's plain,' he said, with a voice-quaver or two after the kiss. 'I account myself a good judge of character, and I think—But where's that champagne?'

The other two hours he spent in Louie's society convinced him that he was right in his resolve thus to look at the best side of things; and it was a glad-hearted and in all respects well-feeling old gentleman who was then whisked away to Euston Station. If any one could have persuaded him to break his word to Miss Sipcot about being at home again that evening, it would have been this pretty future niece of his. But he was rock-firm in the matter.

That earlier notion thrown at Tom Keene about disposing of his drapery business did not so much as re-enter his head even during the return journey in the train. But he thought a great deal about that absurdly impetuous destruction of his will in the morning, and what he would do for these young folks before their marriage and after, beginning, of course, with a new will the next day. Also about Lancelot's remarkable portrait of him, but not at all about Miss Sipcot's rescue and perusal of the document which he had cast with such contumely into the bacon. This behaviour of Miss Sipcot was not the kind of deed he would have condoned ordinarily. But circumstances quite excused her upon the present occasion.

THE LIMITATIONS OF CIVILISATION.

By Rev. E. J. HARDY, M.A., Author of *How to be Happy though Married*, &c.

WE are so proud of our European civilisation that we seldom or never ask ourselves what it means, and whether we are civilised in the best sense of the word. I was myself guilty of this pharisaical complacency until I went to China and lived there for some years. Great indeed was the shock I got when I looked, so to speak, at myself and my fellow Europeans through John Chinaman's eyes. I found that John thought our religion had no good effect upon our lives, that we were not so much immoral as

unmoral—that is, without any morals—and that we were altogether wanting in manners. Many Chinese think that to be a Christian only means to wear European clothes, drink whisky, and take the name of God in vain. The Chinese say that we only respect force as represented in great armies and navies, and are indifferent to the truth contained in their proverb, 'Politeness is better than force.' What, they ask, is to be thought of the evening-dress or want of dress of European ladies, and of their clothes at all times

showing their shape? Are those women civilised who cover themselves with the furs and feathers of beasts and birds?

The idea of civilisation which many people have is to go fast in trains and motor-cars, to eat elaborately cooked food, to wear too many garments, and to have a great number of artificial wants. What happiness is there in moving fast if we bring our wretched selves with us; and when we get to our destination quickly, do we always know what to do with the time we boast that we have 'saved'?

In many respects the European brand of civilisation is an inferior one. The people of China and India can teach us much about art, about manners, and even about religion. If, upon the whole, we may be proud of our civilisation, we cannot but see that it has many drawbacks, and that there are in it many things by no means praiseworthy. Indeed, there are uncivilised people who are as noble, and who have in their way as many advantages, as any civilised people. Is it not an advantage, for instance, for the Indians in South America to be able to live, as they do, on maize almost alone, and to need no doctor's stuffs or operations for appendicitis? If they are ill, it is only when they get whisky or some other civilised poison.

The tendency of civilisation is to increase physical comforts rather than to elevate our nature; it does not make us better or happier. If it gives artificial advantages, it takes away many of the gifts of nature. We have means of locomotion, but they spoil our walking powers. Our senses are helped by curious contrivances, but this makes them weaker than those of savages. We see through the eyes of writers when we read newspapers and books, but this keeps us from seeing through our own eyes and from thinking. Civilisation gives cheap literature, but with it the penny dreadful and the halfpenny paper full of divorce and murder details. We have popular concerts; but we also have the organ-grinder, the gramophone, the pianola, and other instruments of torture. Civilised people travel much and observe little, read much and remember little, eat much and digest little. The present-day worship of money is due to civilisation, for money is needed for the luxuries which civilisation has decreed to be necessities. For money we sacrifice time, health, and reputation; and not to have it is thought the unpardonable sin.

But surely telephones, telegraphs, and the new surgical appliances are blessings? Well, if they are, they are not unmixed blessings. Telephones and telegraphs add to our labour and sorrow; they make more work, and people only gain the same money for doing it. Merchants in Hong-kong have told me that before these so-called labour-saving machines came into use they could close their offices, after they had posted their letters, until the next mail was going out about a fortnight later. Now they may be 'wanted on the telephone' at any moment. I never realised the horrors of which the innocent-looking telephone is capable until one day lately in London. A time-wasting bore, the last person I wanted to see, rang me up at nine o'clock in the morning, and asked me at what hour in the afternoon I should be at home, as he was going to call, and did not want to miss me. He did not know that my efforts to miss him were making me quite thin. This sort of thing gives one no chance, no means of escape, no possibility of saying, 'Not at home.' Much of the weakness of mind and indecision of character that prevails is caused by the telephone. People do not try to remember things when at any moment they can 'phone, and half the messages they send are only to announce changed plans. Bad news travels fast enough, and the telegraph which hastens it is a doubtful blessing. Where ignorance is bliss it is folly to be wise. If my best friend has died in India, or I have lost all my money, the longer I remain without the information the better. The ease with which surgical operations are now performed in the civilised world is, of course, a great boon; but this facility induces some surgeons to doom our members too quickly. Almost as soon as they see us they suggest cutting us up.

I met lately a man who told me that he could speak on any subject for two hours, and that he was going into Parliament. One of the worst of civilisation's crimes is that it creates bores like this. They would not be tolerated in a natural state of society. By the light of reason alone a tribe of Indians hit upon a plan which might be adopted with advantage in Church and State in Great Britain. They decreed that in a native council a member may speak during the space of time he can stand on one leg. When through fatigue his other foot touches the ground his oratory must cease to flow.

THE DAY OF WRATH

CHAPTER XII.—*continued.*

DALROY and Jan Maertz had remained stock-still when the hussar came up. Suddenly the Belgian sheered off, and ran like a hare into the dense wood surrounding the small cleared space in which stood the barn. The building had

evidently been meant to house stock only. There was no dwelling attached. It had served, too, as a rallying-point during some recent scrimmage. The outer walls were chipped with bullets; the doors had been torn off and

burnt; it was typical of Belgium under German rule—a husk given fictitious life by the conqueror's horses and men.

Irene had seen Jan make off, while Dalroy lurched slowly nearer. She could not hear the fierce whisper which bade their sturdy ally bolt for the trees, and, if he got away, implore a strong Belgian patrol to come to the rescue. But she knew that *some* daring expedient had been devised on the spur of the moment, and gathered all her resources for an effort to gain time.

The corporal heard Jan break into a run. Letting go the girl, he swung on his heel and raised the carbine.

Dalroy had foreseen that this might happen. With a calm courage that was superb because of its apparent lack of thought, he had placed himself in the direct line of fire. Standing with his hands in his pockets and laughing loudly, he first glanced over his shoulder at the vanishing Maertz, and then guffawed into the hussar's face.

'He's done a bunk!' he cried cheerfully. 'You said he might go, Herr Unter-offizier, so he hopped it without even saying, "*Aufwieder-sehn*."'

Meanwhile, as he was steadily masking the German's aim, he might have been shot without warning. But the ready comment baffled the other for a few precious seconds, and the men in the barn helped unconsciously by chaffing their comrade.

'You've got your hands full with the girl, Franz,' said one.

'What's she like?' bawled another. 'I can only see a pair of slim ankles and a dirty face.'

'That's all you *will* see, Georg,' said Franz, believing that a scared Belgian peasant had merely bolted in panic. 'This little bit is mine by the laws of war.—Here, you,' he added, surveying Dalroy quite amicably, 'be off to your aunt! You'll probably be shot at Oosterzele; but that's your affair, not mine.'

'You don't know my aunt,' said Dalroy. 'I'd sooner face a regiment of soldiers than stand her tongue if I go home without her niece.'

If he hoped to placate this swaggering scoundrel by a display of good-humour, he failed lamentably. An ugly glint shone in the man's eyes, and he handled the carbine again threateningly.

'To hell with you and your aunt!' he snarled. 'Perhaps you don't know it, you Flemish fool, but you're a German now, and must obey orders. Cut after your pal before I count three, or I'll put daylight through you! One, two'——

Then the hapless Irene committed a second and fatal error, though it was pardonable in the frenzy of a tragic dilemma, since the next moment might see her protector ruthlessly murdered.

To lump all German soldiers into one category was a bad mistake; it was far worse to change her accent from the crude speech of the province of Liège to the high-sounding periods of Berlin society.

'How dare you threaten unoffending people in this way?' she almost screamed. 'I demand that you send for an officer, and I ask the other men of your regiment to bear witness we have done nothing whatsoever to warrant your brutal behaviour.'

The hussar stood as though he, and not Dalroy, had been silenced by a bullet. He listened to the girl's outburst with an expression of blank amazement, which soon gave place to a sinister smile.

'*Gnädiges Fräulein*,' he answered, springing to 'attention,' and affecting a conscience-stricken tone, 'I cry your pardon. But is it not your own fault? Why should such a charming young lady masquerade as a Belgian peasant?'

On hearing the man speak as a well-educated Berliner, Irene became deathly white under the tan and grime of so many days and nights of exposure. She nearly fainted, and might have fallen had not Dalroy caught her. Even then, when their position was all but hopeless, he made one last attempt to throw dust in the crafty eyes which were now piercing both Irene and himself with the baneful glare of a tiger about to spring.

'My cousin has been a governess in Berlin,' he said deferentially. 'She isn't afraid of soldiers as a rule, but you have nearly frightened her to death.'

Their captor still examined them in a way that chilled even the Englishman's dauntless heart. He was summing them up, much as a detective might scan the features of a pair of half-recognised criminals to whom he could not altogether allot their proper places in the Rogues' Gallery.

'You see she's ill,' urged Dalroy. 'Mayn't we go? My aunt keeps a decent cellar. I'll come back with some good wine.'

Never relaxing that glowering scrutiny, the corporal shouted suddenly, 'Come here, Georg!'

The man thus hailed by name strode forward. With him came three others, Irene's fluent German and the parade attitude assumed by Franz having aroused their curiosity.

'You used to have a good memory for descriptions of "wanteds," Georg. Can you recall the names and appearance of the English captain and the girl there was such a fuss about at Argenteau a month ago?'

Georg, a strongly built, rather jovial-looking Hanoverian, grinned.

'Better than leaving things to guess-work, I have it in my pocket,' he said. 'I copied it at the *Kommandantur*. A thousand marks are worth a pencilled note, my boy. Halves, if these are they!'

Dalroy knew that he, and possibly Irene, were doomed. A struggle was impossible. Franz's reference to Oosterzeele being in German occupation forbade the least hope of succour by a Belgian force. There was a hundred to one chance that Irene's life might be spared, and he resolved to take it. It was pitiful to feel the girl trembling, and he gave her arm an encouraging squeeze.

Georg was fumbling in the breast of his tunic, when he seemed to realise that it was raining heavily.

'Why the devil stand out here if we're going to hold a court of inquiry?' he cried. Evidently the iron discipline of the German army was somewhat relaxed in the Death's-Head Hussars.

'Go to the barn,' commanded Franz. 'And, mind, you pig of an Englishman, no talking till you're spoken to!'

Dalroy wondered why the man allowed him to assist Irene; but such passing thoughts were as straws in a whirlwind. He bent his wits to the one problem. He was lost. Could he save her? Heaven alone would decide. A poor mortal might only pray for guidance as to the right course.

Inside the tumble-down barn the light was bad, so the prisoners were halted in the doorway, and a score of troopers gathered around. They were not, on the whole, a ruffianly set. Every man bore the stamp of a trained soldier; the device of a skull and cross-bones worked in white braid on their hussar caps gave them an imposing and martial aspect.

'Here you are!' announced the burly Georg, producing a frayed sheet of paper. 'Let's see—there's six of 'em. Henri Joos, miller, aged sixty-five, five feet three inches. Elisabeth Joos, his wife, aged forty-five. Léontine Joos, daughter, aged nineteen, plump, good-looking, black eyes and hair, clear complexion, red cheeks. Jan Maertz, carter, aged twenty-six, height five feet eight inches, a Walloon, strongly built. Arthur Dalroy, captain in British army, about six feet in height, of athletic physique, blue eyes, brown hair, very good teeth, regular features. An English girl, name unknown, aged about twenty, very good-looking, and of elegant appearance and carriage. Eyes believed brown, and hair dark brown. Fairly tall and slight, but well formed. These last (the English) speak German and French. The girl, in particular, uses good German fluently.'

'Click!' ejaculated Franz, imitating the snapping of a pair of handcuffs. 'Shave that fellow, and rig out the lady in her ordinary toga, and you've got them to the dots on the i's. Who are the first two for patrol?'

A couple of men answered.

'Sorry, boys,' went on Franz briskly, 'but you must hoof it to Oosterzeele, and lay Jan Maertz by the heels. You saw him, I suppose? You

may even pick him up on the road. If you do, bring him back here.—Georg, ride into Oombergen, show an officer that extract from the Argenteau notice, and get hold of a transport. These prisoners are of the utmost importance.'

Irene, who lost no syllable of this direful investigation, had recovered her self-control. She turned to Dalroy. Her eyes were shining with the light which, in a woman, could have only one meaning.

'Forgive me, dear!' she murmured. 'I fear I am to blame. I was selfish. I might have saved you'—

'No, no, none of that!' interrupted the corporal. 'You go inside, *Fräulein*. You can sit on a broken ladder near the door. The horses won't hurt you.—As for you, Mr Captain, you're a slippery fellow, so we'll hobble you.'

Dalroy knew it was useless to do other than fall in with the orders given. He did not try to answer Irene, but merely looked at her and smiled. Was ever smile more eloquent? It was at once a message of undying love and farewell. Possibly he might never see her again. But the bitterness of approaching death, enhanced as it was by the knowledge that he should not have allowed himself to drift blindly into this open net, was assuaged in one vital particular. The woman he loved was absolutely safe now from a set of licentious brutes. She might be given life and liberty. When brought before some responsible military court he would tell the plain truth, suppressing only such facts as would tend to incriminate their good friends in Verviers and Huy. Not even a board of German officers could find the girl guilty of killing Busch and his companions, and this, he imagined, was the active cause of the hue and cry raised by the authorities. How determined the hunt had been was shown by the changed demeanour of the corporal. The man was almost oppressed by the magnitude of the capture. Dalroy was convinced that it was not the monetary reward which affected him. Probably this young non-commissioned officer saw certain promotion ahead, and that, to a German, is an all-sufficing inducement.

The prisoner's hands were tied behind his back, and the same rope was adjusted around waist and ankles in such wise that movement was limited to moderately short steps. But Herr Franz did not hurt him needlessly. Rather was he bent on taking care of him. Throwing a cavalry cloak over the Englishman's shoulders, he said, 'You can squat against the wall and keep out of the rain, if you wish.'

Dalroy obeyed without a word. He felt inexplicably weary. In that unhappy hour body and soul alike were crushed. But the cloud lifted soon. His spirit was the spirit of the immortals; it soon raised itself out of the slough of despond.

The day was closing in rapidly; lowering clouds

and steady rain conspired to rob the sun of some part of his prerogatives. At seven o'clock it would be dark, whereas the almanac fixed the close of day at eight. It was then about half-past six.

Resolutely casting off the torpor which had benumbed his brain after parting from the woman he loved, Dalroy looked about him. The hussars, some twenty all told, reduced now to seventeen, since the messengers had ridden off without delay, were gathered in a knot around the corporal. Some of their horses were tethered in the barn; others were picketed outside.

Scraps of talk reached him.

'This will be a plume in your cap, Franz.'

'A thousand marks, picked up in a filthy hole like this! *Almachtig!*'

'What are they? Spies?'

'Didn't you hear? They stabbed Major Busch with a stable fork. Jolly old Busch—one of the best!'

'And bayoneted two officers of the Westphalian commissariat, wounding a third.'

'The devil! Was there a fight?'

'Some of the fellows said Busch and the others must have been drunk.'

'Quite likely. I was drunk every day then.'

A burst of laughter.

'Lucky dog!'

'*Ach, was!* what's the good of having been drunk so long ago? There isn't a bottle of wine now within five miles.'

'Tell us, then, Herr Kaporal, do we remain here till dawn?'

Dalroy grew faintly interested. It was absurd to harbour the slightest expectation of Jan Maertz bringing succour, but one might at least analyse the position, though the only visible road led straight to a firing-party.

'Those were our orders,' answered Franz. 'Things may be altered now. You fellows haven't grasped the real value of this cop. It wasn't stated on the notice, but somebody of much more importance than any ordinary officer was interested in the girl being caught—she far more than the man.'

'Well, well! Tastes differ! A peasant like that!'

'You silly ass, she's no peasant. That's the worst of living in a suburb. You acquire no standard of comparison.'

(Continued on page 264.)

THE WRITERS OF HAPPINESS.

IN these fearful days we reach forward in thought and imagination to the times of peace that will come again. Never in our lives before did any of us hope and determine as we do now. Oh, the things we will strive for and the lives we will lead when the war is over—when the war is over! It will be as if we shall be born again when the war is done. It is a mere platitude now to say that all will be changed; but perhaps so many things will not be changed as is imagined, or at least they will not be changed of themselves. Life will still be much what we make of it; the volition of man will still count. But it is inevitable, man having aspirations and a conscience, that after this present anguish he, stricken and sore, will look everywhere, search in every place, for that which in suggestion is the antithesis of war and bloodshed and ugliness in the extreme. He will search and find solace and beauty in many places, and we may be sure that one of his happiest retreats will be in the garden of literature, in which new and beautiful flowers will begin to grow.

It is one of the most confident and reasonable of predictions that the war will make a considerable revolution in literature; never has there been a war that did not. And indeed we can well guess in general terms what kind of a revolution this will be. Purity will come back again; sweetness and beauty will shine from the pages; something will be done by writing and

printing and reading to help the survivors of the cataclysm along this disappointing road of life. A new order of writers will arise. At present we can make no predictions about them, or of their kind of writing; but one would like to think that among them will be some possessing the genius and the felicity and the goodness of thought and word as do, say, Robert Louis Stevenson and Anatole France. For two or three reasons one makes mention of them now. In the very last days of peace I was sitting by the sea reading work of theirs and thinking something upon it which may here be expressed as it was thought at the time. Then of all writers these are the best to whom to go for relief in these war-oppressed days. If you will make a trial of them you will find that it is so. I have gone back to the books I was reading in the sun of July 1914. Since then we have been touched with the pathetic case of M. France, far gone in years but still young in mind, saying that in war-time we no longer needed his essays and his stories, and so he would go to be a soldier too, like all the rest of the burning patriots of splendid France. North to the front went Anatole France, and he asked for the uniform and the gun. But young limbs are needed for the war, and if M. France is not fighting now it is not his fault. He has done his duty; he did it for long before the war began, and will do it still when the war is ended. His duty is the spread of happy thoughts.

A happy community count Stevenson and Anatole France as writers who afford them most satisfaction and delight of mind. Indeed, one may suggest with confidence that they make up a separate community of themselves; that, as readers, they are a clear-cut entity with ideals and desires of their own which are suited by these masters as by no others, for while in their writings there are wide differences in thought, subject, and manner, they have in common two fundamental features of their literary system. The outlook of each of them upon the world and its meaning is essentially the same. You will always see in the world that for which you look. This is a simple corollary to the obvious truism that life is what you make it. The constant occupation of man for a long time past has been to seek out what is coarse and ugly.

If proof were required of such a suggestion, so uncomplimentary to the generation, it is presented in the leading pages of the most popular newspapers which in the times of peace were never without their reports of crimes, disasters, and other matters that caused distress to unfortunate people concerned. If the domestic happiness of a man and woman, husband and wife, had been broken, and there had been proceedings in a court of law, letters were produced and published with a suggestion of ridicule. The beauty and purity of feeling which might underlie the words on these poor papers, which were never meant for any eyes other than those of the first receiver, were not searched for, not seen, not understood. Only a vulgarity, which never did exist, was observed by readers who in quality of mind and heart were far below the subjects of the drama which they considered. The modern readers of newspapers, being the bulk of the people, subconsciously prefer always the suggestion of ugliness and pain. At least they would have discomfort. They are only interested in the weather when it is too hot or too cold; when it is normal and pleasant, when they feel healthy and happy, and do their work and pleasures with comfort, there is nothing to be said. It might be suggested that in the normal and peaceful there is no news; but that is not a fair or honest answer. People like bad news, if it has no direct concern with themselves, better than good news. That has been proved in Fleet Street, which merely provides what is demanded. A newspaper that was produced to fulfil a policy of happiness, one that always shunned the unlovable and the ugly, would fail from its first number. Take any popular newspaper you please, and subject it to the test that is here suggested, and you will find that the majority of its articles and paragraphs in the peace-time belonged to the unhappy as against the happy class. It is a state of things resulting from the circumstances of the age, and need not be inquired into. The fact stands forth that

we are encouraged to see a world that is not beautiful.

Now there are many writers who search for the beautiful in life and in the world. It is the true function of the artist. Yet it seems to the community we have indicated that the writers named, the one a Scot and dead, and the other a living Frenchman, have had a happier look on life than others of the moderns, and in what they have written their own happiness of heart and their love of the beautiful and the good have run from their pens in a sweet, melodious song. Each of these men has been a sincere and devout worshipper of beauty in all things of the earth, and they have seen it everywhere. The one lived and the other still lives in a world of sunshine and light. They have regarded the main essentials to proper life as being an appreciation of the beautiful and the good and of love, for without love it seemed to them the soul would shrink and die. They have always been optimists; they have believed when others have doubted. They have smiled when the rest have groaned. They have seen love and beauty in the meanest lives, and in art and its purposes they have always rejoiced. What they have felt they have written in precisely the right tone of expression, and it is not an easy tone to sound. Their thoughts have glided smoothly through their printed pages; their phrasing is always light and happy; the warmth of life is always in their words. There are peculiarities of style which are common to each of them. Stevenson trips through his pages ever so lightly, sometimes with gaiety, commonly with a sudden originality of thought. One would say that Anatole France (who does so much love the good and pure for all his being declared an utter sceptic) is the more dignified, were it possible to imagine Stevenson as in the least degree undignified. But while in the French writer there is always the beauty of idea and the most felicitous expression, there is a certain stateliness about his sentences that serves to exalt the reader. There surrounds the work of each of these writers as of hardly any other that one can recall a delicious fragrance of happiness and love, the perfume of the good and beautiful. Those who would gather happiness from life and the world must bring happiness to it; hence the community of admirers of whom we speak have good hearts and minds.

Is there a happier, more soothing bedside book on the shelves than the *Letters of Stevenson*, as edited by Sir Sidney Colvin? And I recall that in one of those letters, written about the beginning of 1887, he said a pretty thing about good writing, which, written then in reference to a critic who is still alive, might with the most perfect suitability be applied to his own work and that of the French essayist. Said Stevenson, in his letter to Mr Henry James: 'It is a pleasant thing to see a man who can use a pen; he can,

really says what he means, and says it with a manner; comes into print like one at his ease, not shamefaced and wrong-foot-foremost, like the bulk of us.' And these two of whom we speak are writers of the most perfect grace and ease; and if Stevenson may be read for his happiness at night, M. France, for his courage in optimism and his stimulation to ideals, should have the first influence on the morn-awakened mind. The community has a reason for presenting a statement of its preferences at this moment, for it happens by a coincidence that from each of its masters it has lately gained a boon. To the volumes of Stevenson's letters that we have enjoyed for a long time past there have been added recently a few fragments that have never before been published, written for the most part when he was very young, and looking a little anxiously, a little wonderingly, and perhaps a little doubtfully upon the life that lay before him. From M. France, with the most admirable assistance of Mr A. W. Evans in the capacity of translator, we have gained the second series of *La Vie Littéraire*, or 'On Life and Letters,' as it is called in the excellent English form in which it is being published by Mr John Lane. It is some two or three years since the first of these translated volumes appeared, and it was so well done that we have waited somewhat impatiently for the second. The original work in the French, consisting as it does for the most part of critical essays which the author contributed to *Le Temps*, was issued in four volumes, and the translation is following the same system. In a general way one always must view translations with a certain degree of doubt. The thoughts of a writer blossom to perfection only in their own literary soil, the native words; in the best of translations some of the music of the phrases must be lost. But again, except in the most infrequent case of the foreign reader being as well accustomed to the writer's language as to his own, not merely in the speaking and writing sense, but in that of knowing its inner soul, realising every nuance of expression, meaning, and timing of the syllables, more is lost by the reader's attempt to reach the mind of the writer through his own language in the original than would be by the acceptance of translation. That seems to me to be a fair statement of the rights and wrongs of reading translations, a matter that so much disturbs the minds of earnest and conscientious readers. In the case of Mr Evans's translations of M. France's work it need not worry, for the translator has been at pains to comprehend very thoroughly the peculiar graces, the subtle beauties, of his author's style, and the result is work in which nothing of the original good appears to have been lost.

Reverting to Stevenson, the large number of new letters of his that were lately given to the public are perhaps not in themselves of deep

consequence, and give us little new information about the doings, the work, or the thoughts of R. L. S. that we did not know; but to Stevensonians all that comes new to them is welcomed and is precious. These letters have been yielded up by his stepson, Mr Lloyd Osbourne. The first of them is dated early in 1873, when he was only twenty-three years of age. He was then still pottering about with studies for the law, and the literary life was barely more than a dream for him. It was a strange time to be settling down in a spirit of melancholy resignation to a life of mere peace and quietness; but listen to this philosophy: 'I think now, this 5th or 6th April 1873, that I can see my future life. I think it will run stiller and stiller year by year, a very quiet, desultorily studious existence. If God only gives me tolerable health, I think now I shall be very happy; work and science calm the mind and stop gnawing in the brain; and as I am glad to say that I do now recognise that I shall never be a great man, I may set myself peacefully on a smaller journey, not without hope of coming to the inn before nightfall.' All are familiar with the unhappy feeling that came to exist between Stevenson and his father because of the former's critical attitude toward Christianity, and one of these new letters, written by him from a Parisian café to his parent, when he was twenty-eight, has some special interest. 'I have had some sharp lessons,' he says, 'and some very acute sufferings in these last seven-and-twenty years; more than even you would guess. I begin to grow an old man; a little sharp, I fear, and a little close and unfriendly; but still I have a good heart and believe in myself and my fellow-men, and the God who made us all. . . . There are not many sadder people in the world, perhaps, than I; I have my eye on a sickbed. . . . Two years ago, I think, I was as bad a man as was consistent with my character. And of all that has happened to me since then, strange as it may seem to you, everything has been, in one way or another, bringing me a little nearer to what I think you would like me to be. 'Tis a strange world indeed, but there is a manifest God for those who care to look for Him. This is a very solemn letter from my surroundings in this busy café; but I had it in my heart to write it; and indeed I was out of the humour for anything lighter.'

It happens inevitably that there are some who will disagree with the critic's point of view, and object to his conclusions, and M. France is occasionally accused of missing an obvious truth in the application of his critical faculties to a subject with which he engages. To some he appears, so much are his investigations devoted to the discovery and advertisement of the beautiful, to be too little censorious, a too reluctant fault-finder. The prefaces to each of the four volumes of *La Vie Littéraire* count among his most perfect and graceful work; that to the

first volume is a classic among essays in French. There is a sentence in it in which the author decides that 'the good critic is he who relates the adventures of his own soul among masterpieces.' Such adventures are to be joyous, and so we have M. France continually pleased and benign. Yet this apostle of the good has a power of bitter denunciation when roused to it that is the more bitter for its infrequent employment. In the whole range of literary criticism has there ever been anything fiercer, more scathing, than the essay which appears in the first of the four volumes of *La Vie Littéraire* in which he denounced Zola for his *La Terre* on its publication? It is unforgettable. At the end of a terrific onslaught the champion of purity and beauty in life wrote thus: 'There is in us all, in the small as well as in the great, in the humble as well as in the lofty, an instinct of beauty, a desire for all that adorns and beautifies, and this, spread throughout the world, makes the charm of life. M. Zola does not know it. There is in man an infinite need for loving which makes him divine. M. Zola does not know it. Desire and modesty are sometimes charmingly blended in human souls. M. Zola does not know it. There are on earth magnificent forms and noble thoughts. M. Zola does not know it. Even many weaknesses, many errors, and many faults have a touching beauty of their own. Grief is sacred. The sanctity of tears is at the base of all religions. Misery should suffice to make a man august in the sight of men. M. Zola does not know it. He does not know that the graces are seemly, that philosophic irony is indulgent and gentle, and that human failings inspire only two feelings in well-regulated minds: admiration or pity. M. Zola is entitled to the deepest pity.'

It is with this castigation in mind that English readers of the second translated volume turn with expectancy to the chapter headed 'M. Zola's Purity,' embracing the critic's comments on *Le Rêve*, which Zola had just then published. Zola had determined on giving out something less unpleasantly pungent in its utter naturalism than his former works, a novel that 'might be put into the hands of all women and even of young girls.' It was advertised that the new story was chaste, and that the novelist had determined on a purely idealistic flight, a soaring toward what is most poetically gracious and affecting. Then the critic complained that Zola could not be modest without publishing it in the newspapers; he would have had a less noisy chastity. He said: 'The author of *Le Rêve* confided one day to his shadow his desire to be quit of our mire and to soar into the empyrean, and next day all Paris knew that he had grown wings. They were described, they were measured; they were white, and like the wings of doves.' He continues: 'I confess that M. Zola's purity seems to me very meritorious. It costs him

dear; he has paid for it with all his talent. One does not find a trace of this talent in the three hundred pages of *Le Rêve*. . . . When he does not force his talent, M. Zola is excellent. He is without a rival in painting washerwomen and zinc-workers. I confide it to you in a whisper: *L'Assommoir* delighted me. I have read ten times and with unmixed joy the marriage of Coupeau, the feat on the goose, and Nana's first communion. They are admirable pictures, full of colour, movement, and life. But one man is not qualified to paint everything. The most skilful artist can comprehend, seize, and express only what he has in common with his models; or, to put it more clearly, he never paints anything but himself. Some, in truth, such as Shakespeare, have represented the universe. That is because they had an all-embracing soul. Without offence to M. Zola, his soul is not of that sort. . . . This chief of the naturalist school affronts nature every moment.'

Such a flame of anger is welcome for occasional relief, and a reassurance that in the ideal of the essayist there is no exaggerated softness. For the most part his happy thoughts, his inspirations in aphorism, flow evenly and pleasantly through the pages. Again, his preface is charming. 'There is a means of attracting,' he says, 'which is within the reach of the most humble, and that is naturalness. One seems to be almost attractive as soon as one is absolutely true. It is because I have given myself completely that I have deserved some unknown friends. The only cleverness of which I am capable is not to hide my faults.' Here: 'When the road is strewn with flowers do not ask whither it leads;' and there: 'Life teaches us that we are never happy except at the price of some ignorance.' And: 'All books in general, and even the most admirable, seem to me infinitely less precious for what they contain than for what he who reads puts into them. The best, in my opinion, are those that are most suggestive, and suggestive of the most diverse things.' He is soliloquising on a new poem by Sully-Prudhomme, *Le Bonheur*, when he writes: 'It is impossible, in truth, to invent anything. Our whole imagination is made up of memories. We have even manufactured heaven out of materials taken from earth. The myrtles of the Elysian fields are to be found in our gardens, and the angels' harps come from our lute-makers. The nameless planet to which the poet carries us is more beautiful and pleasanter than ours, but it contains nothing which earth does not contain. . . . It may well be that the universe is upon the whole monotonous enough, and that it does not deserve the insatiable curiosity with which it inspires us.' He says again in these comments on happiness: 'We have love on earth, but it is at the price of death. If we were not destined to perish, love would be something inconceivable.'

What is the most beautiful thing in the world? Standards and definitions may have to be hard thought upon before to ourselves a satisfying answer may be given. Might we not agree that a little child, with the sublimity of its innocence, its purity and its pathos, the majesty of its simplicity and the utter compassion which its trust inspires, is the most beautiful? For it excites the tenderest and noblest emotions in those who contemplate it. The pathos of its situation, of its innocence and its trust, is something that is not quite of the world, and truly no child is of the earth and plain humanity until its absolute innocence and belief have been cankered by the first doubt. We should be pleased, therefore, to listen to the essayist when he touches upon a subject concerned with little children, for we can nearly imagine his treatment. He had read a book of children's tales, and he tells us that with the author thereof he believes in the souls of toys, and goes forth to a delightful demonstration.

See: 'For my own part I do not hesitate to formulate my creed. I believe in the immortal soul of Punch. I believe in the majesty of marionettes and dolls. Doubtless there is nothing human according to the flesh in those little personages of wood or cardboard, but there is in them something divine, however little it may be. They do not live as we do, but still they live. They live the life of the immortal gods. . . . For, look you, they are like the lesser idols of antiquity. They bear even a still closer resemblance to those ruder figures by which savages attempt to show the invisible. And what should they be like

if not idols, since they are themselves idols? There is an absolutely religious function. They bring to little children the only vision of the divine which would be intelligible to them. They represent all the religion which is accessible to tender years. They are the cause of our earliest dreams. They inspire our first fears and our first hopes. Pierrot and Punch contain as much divine anthropomorphism as brains, as yet scarce fashioned though terribly active, can conceive. They are the Hermes and the Zeus of our babies. And every doll is to this day a Proserpine, a Cora, for our little girls. I would have these words taken in their most literal sense. Children are born religious. M. Hovelacque and his municipal council do not perceive a god anywhere. Children see them everywhere. Their interpretation of nature is mystic and religious. I will even say that they have more relations with gods than with men, and this proposition will not appear strange if we remember that since the divine is the unknown, the idea of the divine is the first which must engage the attention of growing thought. . . . Since children, then, are born religious, they worship their toys. They ask of their toys what men have always asked of their gods: joy and forgetfulness, the revelation of mysterious harmonies, the secret of being.' My bookseller tells me now that he sells more of the works of M. France in both French and English than he does of many English writers of high repute. It is so much to the good for readers. I have few desires so keen as to read the first work that M. France will write after the war is ended.

THE DEVELOPMENT OF PERU.

By DEREK MANSON.

NEARLY four hundred years ago a man looked out from the deck of a small vessel upon one of the picturesque valleys that adorn the shores of the South American Pacific. That man was Francisco Pizarro, and the green landscape upon which he gazed was that of one of the outposts of the Inca Empire of Peru.

Pizarro found, as he sailed along the coast, numerous valleys, supporting by means of irrigation a considerable population. At the back of these valleys, and communicating with them through deep cañons, lay the great plateau region which was the heart of the Inca Empire. Pizarro set before him the conquest of this empire; and the combination of audacity, astuteness, and fortuitous circumstance which enabled him to accomplish his purpose furnished material for one of the most fascinating romances of history.

After the military conquest of Peru, Pizarro and his successors established various towns and industries modelled upon the types of Europe, and laid the foundations of a modern state,

which under the republican form of government established in 1821, and especially since the war with Chili, 1879-84, has sought among progressive nations the place demanded by its splendid resources and growing national spirit. But in all epochs of its history the material progress of Peru has been seriously retarded by the geographical conditions among which the Inca nation had been evolved. The opening of the Panamá Canal—from which the western South American states naturally expect so much—within a few years of the four hundredth anniversary of the discovery of the Pacific by Balboa, has found Peru still a country of much unexplored wealth ready for the conquest of modern industrial organisation. Partially to realise even the geographical conditions which have compelled Peru to wait for this epoch of the twentieth century is to appreciate more readily the efforts of those who, with a national income of not much more than three millions sterling, are striving to lay down upon the titanic

features of this country the network of railroads, canals, and other improvements which form the basis for the development of a nation's resources.

Peru comprises an area of approximately four hundred and forty thousand square miles. Of this area more than three-quarters, or three hundred and twenty-five thousand square miles, is drained by streams flowing into the Atlantic Ocean through the Amazon River. The remaining portion consists of a strip, averaging less than a hundred miles in width, whose rivers all flow into the Pacific. Although the greater part of the population lies upon the Atlantic side of the Continental Divide, and although on that side are many towns and communities of relatively dense populations, it is upon this latter-mentioned area of the Pacific coast watersheds that the principal towns are built and the administrative and business centres of the country exist. Of this one hundred and fifteen thousand square miles, over half lies upon the steep slopes or within the deep gorges of the Andean plateau; while of the remaining half, which is relatively flat or of gentle slope, less than 2 per cent. is cultivated, although this percentage could be increased to 6 or 8 per cent. by properly directed irrigation. The line of least resistance in the development of Peru will probably be found to lie in the increase of the irrigated area of the coast, and in more skilful irrigation and cultivation in the existing agricultural industries of that region. At the same time, the great Atlantic drainage area owned by Peru must not be forgotten. It may be said that, excepting for the coastal valleys above referred to, and excepting for conditions arising from the recent extension of certain short railway lines towards the great interior, the Government of Peru is in the condition of a man who owns a large garden, from which he is separated by a wall fourteen thousand feet high, but into which his neighbour has access by numerous navigable waterways. The problem of the development of Peru is, therefore, in great part, a problem of getting ready access over this wall; the gigantic region of the Andes is a geographical fact to which all comprehensive projects for the development and administration of the country must conform.

Not that the Andes must be considered as a barrier, and no more. Considered by themselves, indeed, they are a region a hundred and fifty thousand square miles in extent, containing innumerable resources that offer to the nation the means by which this region may be developed for its own sake, while forming a link in the chain of industries that must ultimately unite the two extremes of coast and interior. Of the three subdivisions of which the Andean region is generally considered to be made up, the Puna is the crown of the plateau, the region of higher altitudes, extending from an elevation of about eleven thousand five hundred to sixteen thousand feet above sea-level, in some regions bearing

crests that reach over twenty thousand feet in altitude above the sea. Here are exposed large areas of eruptive or intrusive rocks, such as are generally termed porphyritic, and among which occur innumerable metalliferous veins. Extensive stretches of red and white tufas, or volcanic ashes, deposited in areas which frequently remain nearly horizontal, are found in some regions of the Puna. Wherever the rocks have been hard enough to resist the erosion of more recent geological time, the topography still retains the rounded form given to it by the glaciation which occurred during the earlier history of the plateau. The outcrops frequently show distinctly the scorings of the ice masses, and the damming up of valleys by the morainal materials of former glaciers has given rise to numerous lakes. In this most desolate region the vegetation is scanty and of limited variety. Only two species of small trees are to be found, and these do not thrive on the higher summits. A grass similar to the bunch-grass of the north-western United States is of general occurrence, and a hardy lupin produces almost the only flower of this region.

Below the altitude of eleven thousand five hundred feet stretches the region of the Sierra, a region of wide and narrow valleys of great agricultural possibilities. Such a valley, for instance, as that of Huancayo is very similar in general appearance to those valleys of the western United States which have, under irrigation, become so productive during the past ten years; while its climate is much more uniform, and offers the advantage of a wider choice of crops for production. A railroad unites this valley with the coast; but the lands are still largely owned in small lots by the Indians, and modern methods of agriculture are practically unknown.

The best idea of the climate of the Sierra region of Peru will probably be conveyed by a description of its products. In the inferior limit of this region all kinds of tropical fruits may be grown, some of them being indigenous. Coffee and tobacco find conditions especially favourable for some distance above this limit. Yuccas and various varieties of the potato and corn thrive throughout nearly the whole of its extent, and near the superior limit all the grains of the temperate regions are successfully grown. Here the temperature in winter seldom approaches thirty-two degrees Fahrenheit, while in the inferior limit it rarely falls below forty degrees. Nor does the heat in summer in any part of the Andean region reach the extremes so common to the Atlantic coast states of North and Central America.

Throughout the Quebrada, or lowest region of the Andes, as over all the coastal region, some fourteen hundred miles long, there is practically no rainfall, and the agricultural lands are limited to the banks of alluvium left between the windings of the many rivers that rise in the Puna and flow westward into the Pacific. Where

irrigation has been introduced the cultivation of sugar-cane has flourished, while in some of the coastal valleys a great deal of cotton is successfully grown.

The transandean region of Peru is known as the Montana. It embraces a total area of approximately two hundred thousand square miles, and has its superior or western limit on the eastern flank of the Andean plateau, at an altitude of about five thousand feet above sea-level, while its inferior or eastern limit is near the sea-level on the navigable Amazon. Very few persons living have any comprehensive knowledge of it derived from personal experience. Its geographical isolation, and the fact that the population of Peru does not yet clamour for wider frontiers, have contributed to a paucity of accurate information and hampered the Government in its progress towards military control and industrial development. During the past few years the Government has made explorations along the navigable rivers and other established routes of travel, but has not yet established a systematic survey of the resources of this region, as it has done with respect to the coast and the Andes. The Montana to-day, so far as public knowledge and interest are concerned, bears much the same relation to the Peruvian commonwealth that Alaska bore to the United States previous to the Klondike discoveries. One hears the same contradictory opinions. It is quite probable, however, that for the most part the discouraging reports have been due to accidental and localised experiences rather than to knowledge of various localities; and that where any of the few industrial enterprises initiated in the Montana have failed, they have done so through lack of organisation and capital. The physical difficulties to be met with in this and other regions of Peru hardly permit the establishment of great industries with a pack-mule and a few hundred *soles*.

The Government surveys have established the existence of the most extensive system of navigable waterways in the world, traversing the Montana in several principal trunks that form in the south and east parallel and converging lines reaching nearly to the southern limit of the national territory, and in the north a direct west and east route of transcontinental travel reaching at its western terminus within two hundred and fifty miles of the Pacific coast. That is to say, nature has provided in the north of Peru an open road across the widest part of the national territory, requiring for its completion a railroad of less length than the distance from London to Glasgow, and has opened out from this natural axis of continental development several enormous feeders. It scarcely need be said that the Peruvian Government seeks to build this railroad connecting the Amazon with the Pacific.

While the lowlands of the Montana are sub-

ject to inundations that may retard their development for some years, the uplands are generally reported to have a salubrious climate and a fertile soil. Forests of great value cover practically the entire region, both upland and lowland. Speaking of this part of Peru, Raimondi, than whom no one can have had a more complete knowledge, says: 'Nature in this zone has displayed all its creative force, infinitely varying the capricious forms, the brilliant colours, and the soft perfumes of its productions.'

Not only has the physiography of Peru tended to retard its development, but the character of the indigenous races—which still form one-half of the population, and therefore constitute an important factor in the industrial evolution of the country—has been so moulded by centuries of paternal despotism under the Incas, and of hopeless slavery under the Spanish viceroys, as to inhibit the formation of the progressive habits which grow out of liberty of individual action. Whatever success the Inca dynasty may have had in forming an empire, the descendants of its subjects have not yet been able to adapt themselves to the constitution of a modern commonwealth.

The population of Peru is not more than three millions and a half, or about eight per square mile, as compared with six hundred and thirty-five per square mile in Belgium, and twenty-four per square mile in the United States and Alaska. It must be borne in mind, however, that of this number over a million and a half consist of the indigenous races just referred to; while another million are of mixed race (*mestizos*), leaving not more than seven hundred and fifty thousand of white population. In Europe and North America that percentage of the population is very small which does not by its labour increase year by year the useful wealth of the respective communities. In Peru, however, the indigenous population produces in general very little more than it consumes. Often owners of the land, in a climate that produces more than the necessities of life, with little or no provision for inclemency, they live from hand to mouth, taking no thought of the morrow, and leaving to their children no more than the land and a heritage of similar habits. It is true that at various times in the history of Peru, and especially since the increase of mining and agricultural industries, another element has existed in the conditions described. The Indian has thus the opportunity of leaving his little patch of land in the hands of the weaker members of his family, and of earning wages. He, however, is rarely paid more than an equivalent of two shillings or half-a-crown per day, either in the mines or elsewhere, and these wages seldom grow into a permanent asset of his class, but find their way into the pockets of merchants in return for things which are either bad for the Indian or which he does not need or know how to use.

But if the Indian population is not actually to-day a great wealth-producer, it is a very potential factor when we consider the future industrial development of Peru. The races indigenous especially to the Andean and transandean regions are more perfectly fitted physically to perform the manual labour of development than any other races. Already the mining industry and a part of the agricultural industry of the coast are dependent upon them for labour; and although the Indian himself derives little more benefit from the wealth he thus helps to create than he did under the Inca despotism, without him the labour problem would be an insoluble one.

The mixed races of Peru have naturally displayed a more ready conception of capital and its uses than has the Indian, but the capitalist class has been largely confined to the white population. So small a population as we have seen this to be, in a territory of the size and physical characteristics of Peru, could not produce sufficient aggressive capital to develop the country. The larger industries of the country consequently represent foreign capital, which is invested principally in railroads, docks and wharves, mines, banking, and in a few manufactures. The railroads of Peru, for instance, over sixteen hundred miles in extent, have all been built by foreign—and mainly British—capital; and although they are owned by the Government, with the exception of a very few miles, the builders have the privilege of operation for a long term of years. The large sugar estates are controlled by foreign capital, as are also the principal mercantile houses and banks. The Peruvian Government, recognising the need of such capital, has habitually encouraged its entry into the country, granting liberal concessions to guarantee the earning of interest. In the case of railroads, the Government offers in some cases to pay for the surveys and construction, to concede the privilege of operation for a long term of years, and to grant immense tracts of land and other concessions as bases of industrial support for the roads. In the case of mines, no royalty is demanded, and a merely nominal rental per claim is required. In the case of irrigation, which on the coast is synonymous with agriculture, the study of several projects has been begun by the Government, whose support may be expected by those undertaking the carrying out of the plans which investigations show to be beneficial.

There may be those who, reading the foregoing description of the geographical conditions and considering the low production of Peru to-day, may conclude that it is a poor country. Such a conclusion, however, will have been reached only by dwelling upon the difficulties to be conquered and ignoring the benefits to be derived from their conquest. It has been the purpose of this article to point out both diffi-

culties and benefits. But it is believed that those who look at the matter broadly will conclude that the difficulties only enhance the interest of the problem to be solved, and tend to make the benefits of solution more secure by demanding more careful study, and by the elimination of those not prepared to undertake enterprises requiring large capital and broad policies of administration.

Peru is the only country in South America, excepting Colombia, possessing ports upon both oceans, Iquitos being upon the Amazon at a point navigable by ocean-going vessels. The adaptability of practically all the uplands of the transandean region to the production of rubber is a fact attested by many explorers, and the capacity of the same region to produce all the agricultural products of the tropical world can hardly be doubted, while placer gold has long been known to exist in paying quantities in many localities. The valleys of the Sierra have for centuries furnished all the products of all the climates of the world, and many varieties of rare vegetables and fruits. The crown of the Andean plateau is one of the most intensely mineralised regions of the world. The valleys of the coastal plain, which are within three weeks of Europe now that the Panamá Canal is opened, are capable of great extension by means of irrigation, and produce to-day, with inadequate facilities for both irrigation and cultivation, more cotton to the acre than any region of the United States; grapes that can compete in size and flavour with those of Italy; sugar-cane that produces, when properly watered, as much per acre as that of Hawaii; oranges, bananas, maize, melons, alfalfa, rice, and similar products, of as good quality and in as great abundance per acre as in any other part of the world. These productive possibilities, and these facilities for reaching a large foreign market, in a region rather larger than the combined areas of France and Germany, with only 7 per cent., or less, of its surface under development, spell opportunity not less fruitful in possibility than any which the Western World has offered.

COR CORDIUM.

WHILE evermore the pride of Shakespeare's name
Is one with England's, so shall, living, shine
The rose-red radiance of the light divine
That quickened with the day of Shelley's fame,
Third of the sons the island races claim
As England's glory, while she sets for sign
Of deathless lineage on Song's starry shrine
The lights that no far dawn of time shall shanie.
All winged visions of the lightning brain,
Splendours of thought, fed on life's burning tears,
And exaltation of Song's meteor flight,
All unimaginable dreams of pain
And passion in the paradise love years
Were thine, imperishable Son of Light.

Chambers's Journal

SEVENTH SERIES

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER I.—HIS FIRST SHIP.

'THERE ye are, Martin. That's 'er.'

The leading seaman in charge of the party paused and waved a hand toward a squat gray battleship lying on the other side of one of the basins in Portsmouth Dockyard.

The little expedition of which he was the leader consisted of himself; Martin, the man he had spoken to; and a small hand-cart propelled by another ordinary seaman, breathing heavily. The cart contained a sausage-shaped, khaki-coloured hammock, bound with its seven regulation turns of lashing, and a bulbous brown kit-bag. They were Martin's belongings. He was joining his first seagoing ship.

'Er!' he queried in answer to the leading seaman's remark, shivering and looking rather puzzled. 'Oo!'

He was a puny, undersized little rat of a man, with a pallid, freckled face and a crop of sandy hair. It was early winter, and the piercing wind bit through to his very marrow, while the drizzling rain had already found its way through his oilskin and down the back of his neck. It was distinctly chilly. The tip of his nose and his fingers were blue with cold, and he looked, and felt, supremely miserable.

He repeated his question as the leading seaman executed a few violent steps of a clog-dance, and flapped his arms like an elderly penguin to restore his circulation. 'Er!' he said at last, pausing for breath and seemingly rather surprised at Martin's ignorance. 'That there's the *Belligerent*. That's the ship we're goin' to join—you're goin' to join, that is.'

'That 'er!' Martin ejaculated, gazing with awe at the battleship's great bulk. 'That 'er! Gor' blimy!' He seemed rather appalled.

The leading seaman tittered and sucked his teeth. 'Lor!' he laughed, not unkindly, noticing the anxiety in the youngster's eyes, 'you needn't look like that. They can't eat yer; leastways not if you be'aves yourself they won't. 'Er commander's a very nice gentleman; 'e wus shipmates along o' me in th' *Duncan* up the Straits* six year ago. 'E wus a lootenant then,

an' a bit of a flyer; but 'e's a gent so long as you don't get in the rattle.'†

He paused and eyed the ordinary seaman with the hand-cart, who had released the shafts and was swinging his arms. 'Ere, young fella, not so much of it!' he ordered abruptly, quite forgetting that he had called the halt himself. 'Get a move on yer! You ain't no bloomin' baronite drivin' your own motor-car, to stop 'ere an' stop there has you thinks fit. You ain't wheelin' no perishin' wheel-barrer down Commercial Road neither. Show a leg, me lad!'

The ordinary seaman seized the shafts, and the procession moved forward.

Ten minutes later Martin, with his bag and hammock, was standing on the quarterdeck of his Majesty's first-class pre-Dreadnought battleship *Belligerent*. The leading seaman and the man with the hand-cart were already on their way back to the Royal Naval Barracks, and Pincher Martin, alone, for the first time, felt horribly nervous and uncomfortable. He had been received with scant courtesy or interest by the marine corporal of the watch, who had told him to remain where he was while he fetched a ship's corporal; and now, eyed critically by the grinning side-boy and the messenger, youngsters like himself, who made facetious, rather uncomplimentary, and very audible remarks about his personal appearance, he shivered and waited.

Over on the other side of the deck a tall officer, clad in a greatcoat and swinging a telescope, was walking up and down dodging the rain-drips from the awning. He was a lieutenant, from the two gold stripes and curl on his shoulder-straps, and was, as a matter of fact, the officer of the watch. Presently the merriment at Martin's expense became rather raucous, and the officer turned round and saw the messenger and the side-boy laughing together. The chubby-faced youths caught his eye roving over them, and immediately both became rigid, with an innocent expression on their faces.

'Come here, you two!' he called, beckoning with his telescope.

* 'The Straits' = the Mediterranean.

† 'In the rattle' = in trouble.

The two youngsters trotted up and halted before him with a salute.

'Skylarking again, eh?' the lieutenant asked.

'Oh no, sir. We wasn't skylarkin',' the elder of the two protested.

'Humph! I don't know so much about that. I suppose you were making fun of that man who's just joined, eh?'

'Oh no, sir. I only said to Horrigan'—

'I don't want to hear what you said to Horrigan, or what Horrigan said to you,' interrupted the officer of the watch, smiling to himself. 'Evidently the time hangs heavily on your hands, and I'll not have the quarterdeck turned into a bally music hall.' He looked round the deck and noticed some untidy ends of rope near the ship's side.

'You, Bates,' he went on, 'can amuse yourself by coiling down the ends of these boats' falls and awning jiggers; and you, Horrigan, can broom all that water into the scuppers.' He waved his hand toward some pools of rain-water near the edge of the deck. 'When you've done that you can let me know, and I'll find you another job. Go on—away you go!'

The boys pattered off, and the lieutenant resumed his perambulation.

Presently a ship's corporal, accompanied by the marine who had gone in search of him, came through the battery door and went up to Martin.

'Name and rating?' he demanded abruptly, referring to a book in his hand.

'Martin. Ord'nary seaman.'

'You'll be in No. 47 mess,' said Ship's Corporal Puddicombe, 'and will be in the fore-castle division, starboard watch, first part, first sub. The capten of your top—Petty Officer Casey's 'is name—will tell you off for your stations in your part of the ship. You'll stow your bag in the fore cable flat, starboard side, and your 'ammick in the starboard fore-castle rack. I'll show you where to put 'em, and if you comes along to my office after tea to-day I'll give you a card with it all written on—see?'

'Yessir,' said Martin, looking very bewildered, for he had hardly understood a word of what the man had said.

'It's all right, me lad,' the corporal went on, more kindly. 'You needn't look so scared. You'll soon shake down. Is this your first ship?'

'Yessir.'

The corporal nodded and went off to report to the officer of the watch, who presently returned with him.

'Ord'nary Seaman Martin, sir. Come to join the ship from the barracks.'

The lieutenant eyed the new arrival critically. 'What division's he in, corporal?' he queried.

'Yours, sir. Fore-castle division.'

'How long have you been in the service?' the officer asked next.

'Six an' a narf months, sir,' said Martin.

'Well, it's about time you got your hair cut, my lad. It's much too long. The fore-castle division's my division, and the smartest in the ship, so look out you uphold its reputation. Is your kit complete, by the way?'

'Yessir, all but one pair o' socks.'

'All right; we'll see to that another day. Show him where to put his bag and hammock, corporal, and tell him where his mess is. You'd better introduce him to the barber, too. I can't have the men of my division looking like a beauty chorus.—You,' he added, addressing Martin, 'had better get yourself thoroughly warm. We don't want you to start off by catching a chill.'

'Thank you, sir.'

'Come along o' me,' said the ship's corporal gruffly; and Pincher, picking up his bag and hammock, followed him along the deck.

In another minute they were on the mess-deck. It was a strange place to Martin, accustomed as he was to the large and airy rooms in the barracks ashore. It seemed cramped and restricted. The steel beams supporting the deck above were barely eighteen inches over his head, and every inch of space seemed occupied with something or other. But a sense of order and cleanliness prevailed; for, though the ship was in dockyard hands, and the first lieutenant would have described the mess-deck as 'filthy,' it seemed specklessly clean to an outsider. The glare of the electric lights shone on the spotless white enamel and polished metal-work, and every inch of woodwork which was not varnished and polished was well scrubbed and white.

Moving along a narrow gangway about eight feet wide, they passed the officers' and men's galleys or kitchens. These were placed amidships, and the great cooking-ranges, newly blacked and with their polished steel knobs and utensils winking in the glare, vomited wisps of steam and savoury smells. The black-and-white tiled floors were spotless, and so were the wooden slabs upon which the meat and vegetables were cut up. Farther forward came small, curtained-off enclosures serving as messes for the chief petty officers; and then, forward again, white enamelled steel bulkheads stretching from floor to ceiling.

Extending out from the ship's side, with its row of scuttles and wooden mess shelves and boot-racks, were numbers of white wooden mess tables and narrow wooden forms. They were spaced at precisely equal intervals, and at the end of each table was a neatly rolled strip of white linoleum which served as a tablecloth at meal-times, a couple of shining tin mess kettles, and a teapot. On the deck at the foot of each table was a bread-barge, a squat-shaped tub, to contain the bread belonging to the mess. The barges were all exactly similar, having scrubbed teak sides and polished brass hoops, with the number of

the mess in neat brass figures, and each stood at precisely the same distance from its own table.

From the ceiling or deck overhead hung racks for the reception of the men's circular, black-japanned cap-boxes, and others for their white straw hats—each in its duck cover to keep out dust and dirt—and the newly scrubbed ditty-boxes. These, of white wood, are the receptacles in which sailors keep their small personal belongings. They contain, as a rule, photographs of wives, sweethearts, relations, and friends; letters; and other purely private and valued relics; but, though provided with a lock and key, it is an unwritten and invariable law of the mess-deck that they shall be left unlocked. A man must show his trust in his messmates, and a thief has no place on board one of his Majesty's ships. If petty pilfering does occur, there is no mercy for the culprit, and he is speedily discovered and removed.

It was a Saturday afternoon, and, as the ship was in dockyard hands undergoing a refit, more than half the men were on leave, and the mess-deck was comparatively empty. Those men who were left on board were spending the half-holiday in blissful slumber, for many of the tables and forms bore sleeping figures wrapped in blankets or greatcoats. They snored melodiously and in many keys.

Here and there a man writing a letter or reading looked up with some curiosity as Martin passed, but otherwise he attracted little attention. The advent of another ordinary seaman was too common an occurrence to call for remark, though to the ordinary seaman himself the day of his arrival on board his first seagoing ship would thereafter be mentally marked with a red figure in the calendar of his life.

The ship's corporal, anxious to resume his interrupted sleep in the police-office, hurried on; and soon, after climbing down one slippery steel ladder and up another, they arrived in the foremost bag-flat. This compartment was provided with tiers of numbered racks stretching from deck above to deck below. Each division in the racks held its own brown canvas or painted kit-bag, with the brightly polished brass tally on the bottom stamped with the owner's name, all the tallies being set at precisely the same angle.

The guide halted and pointed to a vacant space. 'There you are,' he said. 'That's where you stow your bag.'

Martin dropped his hammock, and after some difficulty succeeded in insinuating his bag into its appointed place.

'Ere, that won't do,' observed the ship's corporal, shaking his head with a pained expression on his face. 'Slew'er round till the letters on your tally are 'orizental. The first lieutenant 'll 'ave a fit if 'e sees it shoved in any'ow like that.'

Martin did as he was told, and when at last he had stowed his bag to the corporal's satisfaction, was taken to another flat somewhere in

the bowels of the ship, where he was shown where to put his hammock.

He was next taken to his mess, and was introduced to the leading seaman who acted as senior member and caterer. This worthy, a ruddy-faced, heavily built man called Strumbles, was discovered asleep on the table, and was none too pleased when the ship's corporal tapped him on the shoulder and woke him up.

'Strumbles,' he said, 'ere's another O.D.* come to join your mess. Martin's 'is name. Just keep an eye on 'im. 'E's a bit noo to the service. 'E wants 'is 'air cut, too, so you might send 'im along to the 'aircutter after tea.'

Strumbles sat up sleepily and signified his willingness to perform these favours, but the moment the corporal was safely out of sight glared unpleasantly at the new arrival. 'Bit noo to the navy, are yer?' he demanded. 'Name o' Martin, eh?'

'Yessir.'

'Don't call me "sir." My name's Strumbles. Nutty Strumbles they calls me. Is this yer first ship?'

'Yes.'

'Thought so. If it wasn't, you'd know better than to come wakin' up a bloke wot's 'avin' 'is Saturday arternoon caul.'

'I'm sorry,' Martin stammered. 'It wasn't my fault. I didn't know'—

'Course you didn't. 'Owever, now you're 'ere you can just wake me up at seven bells. Know what seven bells is, eh?'

'Yes. 'Arf-parst three.'

'Right. At 'arf-parst three you wakes me up, an' when you done that you can go along to the galley an' wet the tea. Me, an' Ginger Strudwick, an' Nobby Clarke, an' one or two others, is the only blokes o' this 'ere mess aboard. Them two's on watch now, but they'll be down at eight bells clamourin' for their scran like a lot o' wolves; so look out you 'as it ready. When you've wetted the tea you can run along to the canteen an' git height heggs an' height rashers for our supper—I'll give you a *chit* for it when I wakes up; an' when you done that you can tidy up them there mess shelves an' polish the mess kettle an' teapot ready for the rounds to-morrow. Understan'?'

'Yes,' said Martin, hesitatingly.

'Orl rite, look out you does it, then,' remarked Strumbles, laying his head back and resuming his interrupted slumbers.

Martin began to feel rather sorry he had ever joined the navy, for as a young and very ordinary seaman on board a ship it appeared as if every one was his master. The recruiting posters which had been responsible for his entry had said something about 'seeing the world,

* O.D. = the slang term for 'ordinary seaman.' 'O.S.' is one official naval contraction, and 'Ord.' another. 'O.D.' is derived from the latter, in the same way as an able seaman is known as an 'A.B.'

with plenty of pocket-money.' This was what they meant, evidently. He sniffed dubiously. In the barracks where he had undergone his preliminary training he had been one of many others of his own age; but here he was cast entirely on his own resources. He felt lonely and miserable; nobody seemed to take any interest in him, and everybody ordered him about in a dictatorial way which he didn't like at all. He gulped suspiciously, and then looked round with a nervous expression lest the slight sound should have awakened Strumbles.

When, seven months before, Martin had put on his bluejacket's uniform for the first time, he had felt immensely proud of himself. Everybody in his own small village had turned round to stare when he first appeared in it; and he was rather disappointed when, on his arrival in Portsmouth, people in the street neglected to notice him. He liked his jumper, with the V-shaped opening in front, and the blue woollen jersey underneath. He was proud of his blue jean collar with its three rows of narrow white tape, which, he had been told, commemorated Nelson's three great victories of the Nile, Copenhagen, and Trafalgar. He had heard, too, that the black silk handkerchief worn round his neck and tied in front was a badge of mourning for the same great naval hero. But, both in the matter of the collar and the handkerchief he had been led into believing a very popular fallacy.

The square collar was first introduced in the latter portion of the eighteenth century as a means of preventing the grease and flour with which the sailors anointed their pigtailed from soiling their clothes. The three rows of tape, moreover, were placed upon it merely for ornament, for there is no evidence to support the belief that they commemorate the three famous victories. The black silk handkerchief came in at much the same time. In early sea-fights the heat on the gun-decks was stifling, so much so that the men were forced to strip to the waist. To prevent the perspiration from running down into their eyes and blinding them, they were in the habit of tying handkerchiefs round their foreheads, and at ordinary times these were worn round the neck for the sake of convenience. It is true that up till a few years ago our modern bluejackets wore their spare black silk handkerchiefs tied in a bow on the left arm when attending funerals; but there is nothing to support the theory that they were ever introduced as badges of mourning for the immortal Nelson.

But Martin believed these things implicitly, and perhaps, as it fostered the traditions of the service it did him no harm.

Another portion of his attire of which he was inordinately proud was his bell-bottomed trousers. He firmly imagined that these had been introduced merely to give the sailor a rakish appearance, and was not aware that they were brought

in so that the garments could conveniently be rolled up to the knee when their barefooted wearers were giving the decks their usual morning scrub.

Some few years ago a proposal was on foot to do away with the loose trousers, and to clothe the seamen in garments shaped like those in everyday use ashore. As a reason for the change it was urged, with some truth, that in modern ships the men seldom went barefooted, and that less flowing trousers would be less likely to catch in the intricate machinery with which modern ships were supposed to be crammed. But the storm of indignation with which the proposal was received by the men speedily caused it to be dropped. The seamen take no small pride in their nether garments; some of them even go to the trouble and expense of providing themselves with specially wide pairs in which to go ashore on leave.

The wide-brimmed straw hat, which constitutes the modern bluejacket's full-dress headgear, was first introduced in the West Indies early in the nineteenth century, but was not made an article of uniform until much later. Before that time, and up till thirty or forty years ago, shiny black tarpaulin hats, much the same shape as the straw 'boater' of commerce, were *de rigueur* in the navy. The term 'bluejacket,' too, owes its origin to the short, blue, brass-buttoned jacket—rather similar in shape to an Eton jacket, but with no point at the back—which was worn until 1891.

But all Martin's ideas as to his own importance were speedily knocked on the head. By the time he sought his hammock at nine-thirty on that first eventful day he had come to realise that he was very small beer indeed, a mere excrescence on the face of the earth; and that, like Agag, it behoved him to walk warily and with circumspection.

The captain of the forecastle, Petty-Officer Casey—'Mister Casey,' as he insisted on being called—had taken him to his bosom in a gruff, fatherly sort of way, and had given him a few words of advice.

'It's like this 'ere, me lad,' he had pointed out, but not unkindly. 'You're a nordinary seaman, an' wot you've got to do is to carry out other people's orders. If you're told off to do a thing, do it at once, an' cheerful like; don't slouch about th' ship like a ploughboy, nor yet a Portugee militiaman neither. 'Old yourself erec'; take a pride in yourself, an' obey all orders at the rush. If you gives no trouble I'm yer friend, remember that; but if you gits up agin me, an' starts givin' trouble, I won't raise a finger to 'elp you, an' you'd best stan' clear. Don't forget, neither, that I've got my eye on you the 'ole time; an' don't run away wi' the idea that you're doin' the navy a good turn by joinin', like so many on 'em do. It's the navy wot's doin' you a favour by 'avin'

you. If you bears orl this in mind me an' you'll get along orl right, an' some day, p'raps, you'll be a petty-officer the same as me.'

Martin remembered Casey's words of wisdom, and derived no small benefit therefrom.

(Continued on page 277.)

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

AN odd conflict of emotions is with us in this new spring-time. It is the season for expansion, and people now suffer such a sense of confinement as they have not known before. The towns hold us as never previously. Work and cares keep us there more than ever, and so, as a substitute for the country, the parks are sought by many to whom their various delights spring as a surprise. In Hyde Park, the chief park of England, as it may well be considered, an increasing throng of wanderers, with a city and war-worn look upon their countenances, has been noticed. It is true that its walks and the riding row present an unfamiliar aspect, and that, despite the elementary manoeuvres of the new soldiers, there is more freedom from disturbing war-sights here than elsewhere; but this is not the reason why since the later days of winter there have been more people in the Park than old frequenters have seen aforetime at such a season. And it is the same in other cities, no doubt, as in the capital. It must be. The heart is crying for a fresh satisfaction of the sense of space; and now these wide green places, where there are moist earth and trees and winds that blow freely—not like the draughts that spout through streets—are found to yield a strange delight. The workings of the governmental mind sometimes seem to baffle all reason and plain philosophy, and in the name of the new economy strange arrangements have been carried out. And so, for a saving that is to be reckoned not in minutes of war costs, but merely in seconds, the spring in town is robbed of some of its rightful embellishments. Bulbs have been abolished, many flower-beds have been grassed over, and the gardeners tell us that not for three years or 'for the period of the war' will they assume their proper appearance. It is, as is said, to be a drab and economical spring. But thanks to the indefatigability and regularity of Nature, that cares little for wars and other human troubles, the parks still offer a generous measure of the glories of spring. Nothing can hinder them. Some weeks ago the little shrubs of *Daphne mezereum* presented their first show of tiny rosy blooms, and the pale-yellow flowerets of *Forsythia suspensa* glanced shyly towards the lower walks in Kensington Gardens. By now they have given way to bolder blossoms, and the spring is advancing. Never was the eternal drama of the season produced under stranger circumstances. It is wonderful to behold, heartening

and inspiring; and yet it is not that which brings so many people to the parks. They hardly know what it is that calls them there, only that they go in these times, and wander in some vague reflection, as they never did before.

* * *

There is in us an instinct for attachment to the infinite. It is subtle and unceasing. It breathes a murmur of indefinable yearning through the spirit always. It is a mystery rustling in the being, fanning hopes and starting vague impulses. It causes limitations to oppress us; it is the secret of ambition. It is like heavenly fuel for the soul aflame. The desire for freedom and more freedom still, the hope for opportunities, and greater, more splendid chances, both arise from what we may call this instinct for infinity. Man expanding, his spirit feels beyond the world, and its vision strains towards eternity, unseen, unknown. And for that the Creator is the great infinity, this instinct is a special mark of Himself in the man He made. You will find on introspection that this and its sister hope are the major forces of the human mind, and that all such others as are worthy come from them. Unceasingly they urge in the soul the knowledge of man's boundless sphere, they stir him with a restlessness that is half divine. There are manifestations of this supreme instinct at every time and everywhere. It fills the world. It lights upon earthly things, poor and small as they may seem to be, and the touch that makes them as little signs of a vast infinity adds to them a peculiar charm. So crumbling walls that were built in ancient days, old tombs, old work, old learning, all of them have some of the magic of infinity laid upon them. Each time you turn to one of these from the measly cares of a life where business is always business, it seems to say to you, 'What of the eternal now?' The grand suggestion is everywhere. It is with the bird on the wing and in the grain of wheat, and there can be no sort of incongruity when any association is suggested between the instinct of infinity and the simplest actions of common life. That is why freedom warms in us as we tread Constitution Hill, why the glorious sense of space begins to thrill the heart as, swinging through Hyde Park Corner and past the bronze Achilles given by the women of England in remembrance of the Duke and his gallant men, we beat away to the north and west along the most open walk

through the mother of parks. Few of those who walk in here could tell you the reason why, fully and completely, or could explain a mysterious pleasure, a subtle emotional delight, distilled, it would seem, in one's very spirit, that arises when one lingers here. Only a little reflection is wanted; the formula of the instinct of infinity makes a simple and certain explanation. Green is the most stimulating colour in the world, for it is the hue of Nature at her best, doing, creating, living, rejoicing; and the sudden impact upon the eye and the æsthetic sense, wearied by the London gray, of this overwhelming mass of green, cool, clean, refreshing, is like the plunge into a sparkling, rippling stream by a tired and dusty traveller. One admits the beauty, the grand refreshment, of the green of the Park, and is deeply grateful; but it is not that which fills us with that peculiar emotion of achievement of the spirit, an affinity found. Here are trees, lofty, majestic, and, for all their life in town, as fine as forest lords. We agree with the wise man who murmured that it was a great thought of God when He thought the tree. Yet it is not the trees of the Park that cast the spell upon us and lure us there again; nor the fowl on the waters, the birds that have such a freedom that one wonders why city sparrows cling to Cornhill; nor the timid flowers that peep in these spring days. These are all delights; the simple good they stir in us, the happiness they make in us, are ever sweet. But they are just the works, the accessories, some stage trappings, as it were, of old infinity abounding in the world, and finding here in the heart of the throbbing town such a means for the expression of the instinct, for such a shock upon the spirit of us crawling things, such a sense of expansion, such an awakening of the mysterious impulse, as could not well be accomplished in any other way.

* * *

Do not reject this suggestion of Hyde Park, with its ordered walks, its smoothened beds of flowers, its groomed shrubs, its various gates, and even the gaudy memorial on the edge of it, as an instrument for the exercise of this instinct of infinity. Think upon it; reduce it to simple forms. The key to quick understanding is the expression, unemotional and cold, adopted by councils and committees—the Open Space. This is the queen of all Open Spaces among great masses of people and piles of buildings. It serves the greatest purpose. Better than any other piece of earth does it awaken the mind to a sense of the openness of the world, and then maybe to thoughts beyond. Because it is more needed than any other. The human being needs food and drink and clothes. For his development he must have exercise of the mind. But it is seldom reasoned that as much of any of these things he needs for his healthy maintenance and betterment a frequent experience of

space, which brings him subconsciously into touch with infinity. A long unbroken period of life and work amid streets and in rooms brings upon a man insidiously a sense of oppression. The high walls contract upon him; the ceiling bears down; a tremendous vice, like some instrument of punishment prepared by immortal fiends, seems to close in upon him from all sides and from above; and soon his spirit will be crushed, and he will be as nothing good. That experience of the walls closing in is so constant, so acute, so real in the case of persons of feeling and fine nerve who have borne too much confinement in town, that they may be brought almost to cry out in anguish, to feel a sort of madness coming upon them. Solitude is a sweet thing, but it must be taken with caution. Some sense of relief is experienced in the change from one's own rooms to those of the big club, or, say, to the great Reading-Room of the British Museum. Men and women workers having pleasant studies of their own abounding in little comforts come at times to work in the great rotunda, because here there seem to be no walls to oppress them, only a vast circular lining of books. There is not a corner, but a great sense of space. I know that is why. And we, feeling perhaps that we too much neglect the principles of exercise, may sometimes walk fast through the streets, or as fast as frequent impediment will permit. It is a stimulating tramp from Westminster through the full tide of human existence, which Johnson declared was better to be seen at Charing Cross than anywhere, along by the Strand and Fleet Street, up the Hill, and away through the golden land of Gog and Magog, and by the Monument to London Bridge. That is a long, straight walk of which one townsman does not weary, though this street tramping does bother the feet too much. It is a calming walk at night when the City is still and dark, like a mighty vault laden with gold and treasure of the world, keepers watching it in secret places. A sense of mystery creeps upon us when we steal through the City at night, and the awe is not lessened when we tarry at London Bridge, with the stars above and the black band of river gently gurgling underneath. Old Thames can work fine charms upon the emotions. London Bridge, over which the dear Germans, in their most popular novel of the time, imagine themselves to be crossing in the rôle of conquerors! There is no longer a white horse upon it, as we were assured in our childhood there always was; nor even is there now a yellow motor-car, which has come to be its modern substitute. But we may all see ghosts when leaning over the parapets of the London bridges late at night, and listening to the water swirling. Cannot you see the great gilt barges, kings and princes and fine ladies on them, as they were rowed along the grand highway to the gorgeous ceremonies awaiting them? The old Tower,

with its crimes and executions! But it is too easy to become morbid when on this bridge with the stars, and a wanderer has a system for his nightly thoughts hereby. He may either reflect upon memories of voyages begun but a little farther down the stream, and ended somewhere in Africa, or on one of the prettiest problems in the making of balances, with which the City in the daytime does so much occupy itself. In the capital we can account for nearly all things except for the number of horses, carts, and carriages that enter it and never seem to leave. It is true; we have made the most careful countings. An investigation showed that in one week many more vehicles passed over London and Southwark Bridges to the southwards than came back again that way; but this result was wholly changed by the greater number that passed into the City from the south over the spans at Blackfriars and the Tower; and there was a balance of more than three thousand and three hundred in a week going north and not returning. One has difficulty in reconciling this steady balance with the facts and features of trade and the movements it makes. But, remember, some way farther along these roads to the southward ports that begin not far from here, is that fine old gate at Canterbury, through which in olden times every scrap of goods that came from the Continent had to be wheeled as it was admitted to England. This is a proper problem for London Bridge and a dark night—and never have our nights been so dark as of late. The bells in the City steeples seem to tinkle sadly in their gloom. Their jingling is almost weird, considering the present emptiness of the busiest place on earth. Up around this bend of water came in peaceful times the booming of old Ben, from the place where there are half-a-thousand men thus late still hammering with their speeches and their bills at the rivets of this fighting Empire. Did you know that the shock of the Ben hammer of four hundredweights on the thirteen-ton bell makes a bigger sound than that of any other clock-bell in the world? But, alas! its tongue is still in these days of war. Its cheery encouragements, its solemn warnings, leave a blank in our unstruck hours, and we shall be glad to hear again that sonorous chime that is set to a pious prayer than which clock never had better working lines:

All through this hour, Lord, be my guide,
And by Thy power no foot shall slide.

Let us go back now.

* * *

A long digression may seem out of place to any realisation of the heavy weight of walls and roofs closing in upon the huddled townsman, threatening to crush the life of mind and spirit; yet it was intended. There is no street cure for this deep oppression. Had there been one,

surely we should have found it when we stalked through the dead City and meditated on the bridge at midnight. That prescription fails, because it is a mere matter of exercise, and that alone is no specific, as it is too often imagined to be. The limbs may crave for movement, but the mind hungers more for space and all the sense of it. A realisation of the mind's call for space came best to my own comprehension when I stood for a long time on the observation platform at the tail-end of an American railway train as it rushed with us across the prairie, watching in an almost cataleptic state that long, straight line of iron road hummily unwound beneath our feet, and flying fast away into the eastern distance. Hyde Park is no prairie, but it yields to those oppressed by walls just a touch of the sense of freedom that is balm for the spirit. It is for that sense of freedom, space, and the gentle play it makes upon the instinct for the infinite that in these times we like to pass through the columned screen and hark away along the walk that leads to the Victoria Gate. But for the full satisfaction and pleasure of it this must be made a business of exercise too. Fast, swinging movement, with no impeding crowd, must be enjoyed. Step out with head high and a straight back, and see to it that the Gate is made in the first thirteen minutes, and there is time enough for some reflection despite the speed. The glide down the gentle slope in the middle of the Park, with the baby silver birches by the path, is a sensuous thing, and it leads us into a veritable London glade, a hollow filled with trees, always a peaceful view, the only one of its kind we know in London. This townsman's valley has indeed a charm about it. Then, after the Gates, pass through into Kensington Gardens, and, keeping on the northward path, come up to the Broad Walk in not more than fourteen extra minutes, wheel away to the left along that majestic avenue, and in five minutes trail down the little hill at the end of it. That is enough for simple strenuousness, and then, for some relaxing delights, visit the Round Pond, and watch the children play. There is no gentler, more pleasing, reviving sight in all the town. To the weary man the look of happy children is something sublime. Angels lead these little kiddies! You should sit and watch them when they sail those splendid races in the water between the red and the brown balloons. We long for one brief spell to lumber back again over that mountain of used-up years and sail a green one with them, but too much knowledge would have broken mysteries, and we should spoil the race. Neither dainty little Nancy nor pretty Joan seems, as we watch them from the bench on shore, to suspect that the tight balloon has less water surface, and therefore skims the faster. And yet we wonder whether, after all, the sagging skin of brown does not gather the

faint breeze the better. How we wish to play with them, and teach them, and win for them! But does this innocence desire any of our fine experience and our grand capacity for

dispelling childish mysteries? No. We must hold away, leaving undisturbed this sanctity of children's play, and work on at our daily war.

THE DAY OF WRATH.

CHAPTER XII.—continued.

THESE men were Berliners, and were amused by a sly dig at some locality which, like Koeppenick, offered a butt for German humour.

'Hello! isn't that a car?' said one.

There was silence. The thrumming of a powerful automobile could be heard through the patter of the rain.

'Attention!' growled Franz. A few troopers went to the picketed horses. The others lined up. A closed motor-car arrived. Its brilliant head-lights proclaimed the certain fact that the presence of Belgian troops in that locality was not feared. Dalroy recognised this at once, and forthwith dismissed from his mind the last shred of hope.

The chauffeur was a soldier. By his side sat the usual armed escort. Georg galloped up. Oombergen was only a mile and a half distant, and the road through the wood was in such a condition that the car was compelled to travel slowly.

A cloaked staff-officer alighted. The hussars stood stiff as so many ramrods. The new-comer took their salute punctiliously, but his tone in addressing the corporal was far from gracious.

'What's this unlikely tale you've sent in to headquarters?' he demanded harshly.

'I don't think I'm mistaken, Herr Hauptmann,' was the answer. 'I've got that English captain and the lady wanted at Visé. They've practically admitted it.'

'Where are they?'

'The man is sitting there against the wall. The lady is in the barn.—Stand up, prisoner!'

Franz snatched away the cloak. Dalroy rose to his feet. He was smiling at the ruthlessness of Fate. He was still smiling when Captain von Halwig, of the Prussian Imperial Guard, flashed an electric torch in his face. It was unnecessary, perhaps, to render thus easy the task of recognition. But what did it matter? That lynx of a corporal was sure of his ground, and would refuse to be gainsaid even by a staff-officer and a Guardsman.

Von Halwig's astonishment seemed to choke back any display of wrath.

'Then it is really you?' he said quietly in English.

'Yes,' replied Dalroy.

The torch was switched off. Dalroy's eyes were momentarily blinded by the glare, but he heard an ugly chuckle.

'Where is the female prisoner?' said Von

Halwig, with a formality that was as perplexing as his subdued manner.

'Here, Herr Hauptmann.'

The two entered the barn. So far as Dalroy could judge, no word was spoken. The torch flared again, remained lighted a full half-minute, and was extinguished.

Von Halwig reappeared, seemed to ponder matters, and turned to the corporal.

'Put the woman in my car,' he said. 'Fall in your men, and be ready to escort me back to the village. You've done a good day's work, corporal.'

'Two men have gone in pursuit of Jan Maertz, sir.'

'Never mind. They'll have sense enough to come on to headquarters if they catch him. How is this Englishman secured?'

The jubilant Franz explained.

'Mount him on one of your horses. The trooper can squeeze in in front of the car. Has the female prisoner a dagger or a pistol?'

'I have not searched her, Herr Hauptmann.'

'Make sure, but offer no violence or discourtesy. No; leave this fellow here at present. I want a few words with him in private. Assemble your men around the car, and take the woman there now.'

Irene was led out. She paused in the doorway, and the corporal thought she did not know what she was wanted for.

'You are to be conveyed in the automobile, *Fräulein*,' he said.

But she was looking for Dalroy in the gloom. Before any one could interfere, she ran and threw her arms around him, kissing him on the lips.

'Good-bye, my dear one!' she wailed in a heart-broken way. 'We may not meet again on this earth, but I am yours to all eternity.'

'With these words in my ears I shall die happy,' said Dalroy. Her embrace thrilled him with a strange ecstasy, yet the pain of that parting was worse than death. Were ever lovers' vows plighted in such conditions in the history of this gray old world?

Franz seized the girl's arm. She knew it would be undignified to resist. Kissing Dalroy again, she whispered a last choking farewell, and suffered her guide to take her where he willed. She walked with stumbling feet. Her eyes were dimmed with tears; but, sustained by the pride of her race, she refused to sob, and bit her lower lip in dauntless resolve not to yield.

The rain was beating down now in heavy gusts. Von Halwig, if he had no concern for the comfort of the troopers, had a good deal for his own.

'Damn the weather!' he grunted. 'Come into the barn. You can walk, I suppose?'

He turned on the torch, which was controlled by a sliding button, and saw how the prisoner was secured. Then he flashed the light into the interior of the barn. It was a ramshackle place at the best, and looked peculiarly forlorn after the rummaging it had undergone since the fight, a recent picket having evidently torn down stalls and mangers to provide materials for a fire. Part of a long sloping ladder had been consumed for that purpose, so that an open trap-door in the boarded floor of an upper storey was inaccessible. The barn itself was unusually lofty, running to a height of twenty feet or more. There were no windows. Some rats, tempted out already by the oats spilled from the horses' nose-bags, scuttled away from the light. Through the trap-door the noise of the rain pounding on a shingle roof came with a curious hollowness.

Von Halwig did not extinguish the lamp, but tucked it under his left arm. He lighted a cigarette. With each movement of his body the beam of light shifted. Now it played on the wall, against which Dalroy leaned, because the cramped state of his arms was already becoming irksome; now it shone through the doorway, forming a sort of luminous blur in the rain; now it dwelt on the Englishman, standing there in his worn blouse, baggy breeches, and sabots, an old flannel shirt open at the neck, and a month's growth of beard on cheeks and chin. The hat which Irene made fun of had been tilted at a rakish angle when the corporal removed the cloak. Certainly he was changed in essentials since he and the Guardsman last met face to face on the platform at Aix-la-Chapelle.

But the eyes were unalterable. They were still resolute, and strangely calm, because he had nerved himself not to flinch before this strutting popinjay.

'You wonder why I have brought you in here, eh?' began Von Halwig, in English.

'Perhaps to gloat over me,' was the quiet reply.

'No. Is it necessary? At Aix I was excited. The Day had come, The Day of which we Germans have dreamed for many a year. I am young, but I have already won promotion. I belong to an irresistible army. War steadies a man. But when we reach Oombergen you will be paraded before a crusty old General, and even I, Von Halwig of the staff, and a friend of the Emperor, may not converse with a spy and a murderer. So we shall have a little chat now. What say you?'

'It all depends what you wish to talk about.'

'About you and her ladyship, of course.'

'May I ask whom you mean by "her ladyship"?''

'Isn't that correct English?'

'It can be, if applied to a lady of title. But when used with reference presumably to a young lady who is a governess, it sounds like clumsy sarcasm.'

'Governess the devil! With whom, then, have you been roaming Belgium?'

'Miss Irene Beresford, of course.'

'You're not a fool, Captain Dalroy. Do you honestly tell me you don't *know*?'

'Know what?'

'That the girl you brought from Berlin is Lady Irene Beresford, daughter of the Earl of Glastonbury.'

There was a moment of intense silence. In some ways it was immaterial to Dalroy what social position had been filled by the woman he loved. But in others the discovery that Irene was actually the aristocrat she looked was a very vital and serious thing. It made clear the meaning of certain references to distinguished people, both in Germany and in England, which had puzzled him at times. Transcending all else in importance, it might even safeguard her from German malevolence, since the Teuton pays an absurd homage to mere rank.

'I did not know,' he said, and his voice was not so thoroughly under control as he desired.

Von Halwig laughed loudly. '*Almachtig!*' he spluttered, 'our smart corporal of hussars seems to have spoiled a romance. What a pity! You'll be shot before midnight, my gallant captain, but the lady will be sent to Berlin with the utmost care. Even I, who have an educated taste in the female line, daren't wink at her. Has she never told you why she bolted in such a hurry?'

'No.'

'Never hinted that a royal prince was wild about her?'

'No.'

'Well, you have my word for it. *Himmel!* women are queer.'

'She has suffered much to escape from your royal prince.'

'She'll be returned to him now, slightly soiled, but nearly as good as new.'

'I wish my hands were not tied.'

'Oh, no heroics, please. We have no time for nonsense of that sort. Is the light irritating you? I'll put it here.'

Von Halwig stooped, and placed the torch on the broken ladder. Its radiance illumined an oval of the rough, square stones with which the barn was paved. Thenceforth the vivid glare remained stationary. The two men, facing each other at a distance of about six feet, were in shadow. They could see each other quite well, however, in the dim borrowed light, and the Guardsman flicked the ash from his cigarette.

'You're English, I'm German,' he said. 'We represent the positive and negative poles of thought. If it hurts your feelings that I should speak of Lady Irene, let's forget her. What I really want to ask you is this—why has England been so mad as to fight Germany?'

CHAPTER XIII.—THE WOODEN HORSE OF TROY.

THE question struck Dalroy as so bizarre—in the conditions so ludicrous—that, despite the cold fury evoked by Von Halwig's innuendos with regard to Irene, he nearly laughed.

'I am in no mood to discuss international politics,' he answered curtly.

The other, who seemed to have his temper well under control, merely nodded. Indeed, he was obviously, if unconsciously, modelling his behaviour on that of his prisoner.

'I only imagined that you might be interested in hearing what's going to happen to your damned country,' he said.

'I know already. She will emerge from this struggle greater, more renowned, more invincible than ever.'

'*Dummes zeug!* All rubbish! That's your House of Commons and music-hall patter, meant to tickle the ears of the British working-man. England is going to be wiped off the map. We're obliterating her now. You've been in Belgium a month, and must have seen things which your stupid John Bulls at home can't even comprehend, which they never will comprehend till too late.'

He paused, awaiting a reply perhaps. None came.

'It's rough luck that you, a soldier like myself, may not share in the game, even on the losing side,' went on Von Halwig. 'But you would be a particularly dangerous sort of spy if you contrived to reach England, especially with the information I'm now going to give you. You can't possibly escape, of course. You will be executed, not as a spy, but as a murderer. You left a rather heavy mark on us. Two soldiers in a hut near Visé, three officers and a private in the mill, five soldiers in the wood at Argenteau'—

'You flatter me,' put in Dalroy. 'I may have shot one fellow in the wood, a real spy, named Schwartz. But that is all. Your men killed one another there.'

'The credit was given to you,' was the dry retort. 'But—*es ist mir ganz einerlei*—what does it matter? You're an intelligent Englishman, and that is why I am taking the trouble to tell you exactly why Great Britain will soon be Little Britain. Understand, I'm supplying facts, not war bulletins. On land you're beaten already. Our armies are near Paris. German cavalry entered Chantilly to-day. Your men made a great stand, and fought a four days'

rearguard action which will figure in the textbooks for the next fifty years. But the French are broken, the English Expeditionary Force nearly destroyed. The French Government has deserted Paris for Bordeaux. And, excuse me if I laugh, Lord Kitchener has asked for a hundred thousand more men!'

'He will get five millions if he needs them.'

Von Halwig swept the retort aside with an impatient flourish.

'Too late! Too late! I'll prove it to you. Turkey is joining us. Bulgaria will come in when wanted. Greece won't lift a finger in the Balkans, and a great army of Turks led by Germans will march on Egypt. South Africa will rise in rebellion. Ireland is quiet for the time, but who knows what will happen when she sees England on her knees? Italy is sitting on the fence. The United States are snivelling, but German influence is too strong out there to permit of active interference. And, in any event, what can America do except look on, shivering at the prospect of her own turn coming next? Russia is making a stir in East Prussia and along the Austrian frontier, so poor Old England is chortling because the Slav is fighting her battles. It is to laugh. We'll pen the Bear long before he becomes dangerous. I am not boasting, my friend. Why should I, Captain von Halwig of the Imperial Guard, be messing about in a wretched Flemish village when our men are about to storm Paris in the west and tackle Russia in the east? I'll explain. I'm here because I know England so well. My job is to help in organising the invading force which will gather at Calais. Ah! that amuses you, does it? The British fleet is the obstacle, eh? Not it. Seriously now, do you regard us Germans as idiots? No; I'm sure you don't. You *know*. These fellows in Parliament *don't* know. I assure you, on my honour, our General Staff is confident that a German army will land on British soil—in Britain itself, I mean—before Christmas.'

The speaker interrupted this flood of dire prophecy in order to light a fresh cigarette. Then, clasping his hands behind his back and strutting with feet well apart, he said quite affably, 'Why don't you put a question or two? If you believe I'm reciting a fairy tale, say so, and point out the stupidities.'

Now Dalroy had not been 'amused' by the statement that the Germans might occupy Calais. He had already discounted even worse reverses as lying well within the bounds of possibility. He was certain, too, that the Prussian was saying that which he really believed. But his nerves of steel were undoubtedly tried almost beyond endurance at the instant Von Halwig noticed the involuntary movement which elicited that uninvited comment on the British fleet.

As the word 'Calais' quitted the Guardsman's lips, a rope, with a noose at the end, dropped

with swift stealth through the open trap-door. Its descent was checked when the noose dangled slightly higher than his head, and whoever was manipulating it began at once to swing it slowly forward and backward. Von Halwig stood some six or seven feet nearer the wall than the point

which the rope would have touched if lowered to the floor, so the objective aimed at by that pendulum action was not difficult to grasp, being nothing else than his speedy and noiseless extinction by hanging.

(Continued on page 285.)

NEWS BY TELEGRAM.

By W. V. ROBERTS.

AS one result of the Chancellor of the Exchequer's proposal to raise the charge for press telegrams, many people probably learned for the first time of the existence of special rates for newspaper messages. The disclosure was like a peep behind the scenes, explaining in some degree why so many things 'get into the papers.' For it is beyond question that much that occurs in remote parts of the United Kingdom would never be heard of by the country at large but for the cheap newspaper telegram and the enterprise of the local reporter. The cheap telegram rate is, however, the outcome of something like a rule of three: there is news which need not be sent till the evening; the telegraph wires are not used so much in the evening as during the hours of business; therefore press messages may be transmitted in the evening at a reduced rate. Full use is thus made of the wires at a slack time, and the public thirst for news is gratified.

Now the basis of the press message has been that between six P.M. and nine A.M., when most of the work is done, a hundred words may be sent for a shilling; but they must be words absolutely for publication, everything private in them being charged at the rate of a halfpenny a word. The method of the local reporter or correspondent who works on speculation is therefore something like this: an event of special interest occurs in his district, and he thinks it worth while to telegraph a message of two or three hundred words or more to one or more of the London papers, knowing that if it is accepted and published he will be paid the usual rate per line for his trouble, and the cost of the telegram in addition. Better still, if the message is sent in identical terms to more than one paper the Telegraph Department regards it as a 'duplicate' message, and for each message beyond the first charges only twopence per hundred words, so reducing very greatly the average cost of the whole telegram if sent to a number of papers.

On that basis much exceedingly useful and interesting work has been done, work which readers have had good reason to appreciate. At the same time, men with a keen scent for news have added substantially to local income, and sometimes built up quite a profitable connection. Some centres, from the very nature of their position, offer splendid opportunities for the

news-gatherer; while the presence or absence of a notability may make a difference of pounds per month to reporter or correspondent. When Mr Gladstone was in residence at Hawarden, for example, he was always 'bobbing up' at this ceremony or that, or making speeches unexpectedly, with the result that he became as a gold-mine to some of the local newspaper men, who knew full well that all his sayings and doings had a market value in the morning journals of the country. Again, a big railway accident, or mining disaster, or other event of great national concern has given many a local reporter an instant opportunity of earning money and opened channels for later work of a lucrative kind, because of the ability, resource, or enterprise displayed in the moment of emergency.

Of course, all the work is not mere speculation. Most of the leading newspapers have their own recognised or stated correspondents in the principal districts which they serve. But, even so, payment is often by results, and the results are determined by the messages sent over the wire and accepted after six o'clock. But there is this difference. A trusted local correspondent who is expected frequently to send news is generally furnished by the employing newspaper with 'passes.' These passes are obtained from the Telegraph Department of the Post-Office, and all a correspondent has to do in despatching a message is to fill up a 'pass' and hand it with his 'copy' to the telegraph clerk, no payment from him being then required. The department deals with all the passes from day to day, and sends a periodical account to the newspaper concerned.

But then there is another point. Many of the telegraph offices in the country close at eight o'clock, and often at a political or other meeting the speech to be reported is not made till after that hour. In that event the reporter or correspondent must give due notice that he wishes the office to be kept open, with a telegraphist in attendance, for a certain time, and for that privilege he pays an extra fee, usually beginning at a shilling and depending on the time of prolonged opening and work done. During the war this rule has been felt more severely, because many offices that formerly kept open till late have by official order closed early, and journalistic work at night has correspondingly been hampered.

But it has not been a matter for newspaper men alone. Supposing a prominent M.P. has gone down to address his constituents or a recruiting meeting. He has desired to see a report in the paper next morning, but a closed telegraph office has been against him; for in the absence of express instructions free-lance reporters have been less inclined than formerly to take double risk—cost of telegram and cost of keeping office open—and thus news to that extent has been curtailed.

That leads to a word on changes that have occurred in the reporting of speeches. Before telegraphy was invented the London papers, if they wanted a report of a speech in the country by some prominent personage, had to send a special corps of reporters to 'take' him. Charles Dickens, as everybody knows, was a member of the reporting corps of the *Morning Chronicle*, and it was to experience so gained that some of his best work in the *Pickwick Papers* was due. But it might be that, owing to the distance to be covered, the speech could not be printed till the second or third morning after delivery.

But the coming of the telegraphs and the establishment of influential papers in all the chief centres of the United Kingdom made an opening for the News Agency. So far as speeches were concerned, that organisation was founded largely on the principle that if it sent one corps to report a speech and took advantage of the cheap duplicate system of telegrams, a great many papers might be supplied with full reports at far less cost to each editor than was involved in the sending of individual corps from many offices. The system flourished, and thirty or forty years ago, when the demand for speeches was greater than it is to-day, the morning papers were often full of speeches delivered overnight in various parts of the country. Ministers, therefore, profited much by the system. Mr Gladstone certainly did, for it is beyond doubt that his utterances in the famous Midlothian campaign would never have been reported as they were but for the cheap telegram possible through the agency. In its turn, the Telegraph Department had always to be sending to out-of-the-way places to fit up wires and connect them with the trunk telegraph lines, with operators to work them; for Ministers often have a habit of addressing meetings in obscure villages, knowing that the 'wire' will certainly ensure them a national audience next day. Sometimes there are failures. A very conspicuous one occurred during the premiership of the late Lord Salisbury. That statesman was announced

to make an important speech in a seaside resort on the south-east coast. The speech was largely ordered by the papers, and operators were despatched to fix the wires. A strong reporting corps also duly appeared; but somehow something went wrong with the wires. The speech did not get through. News editors were clamouring for it, and leader-writers were waiting for it. But all was vain. Next day there could only be inquiry as to the cause of the failure, excuse of a kind, and promise that it should not occur again. Lord Salisbury was probably as disappointed as any one, for his speech was hardly reported at all.

More recently there has grown up the system of the special wire, by which on terms the Telegraph Department allows a newspaper the exclusive use of one, two, three, or more wires between London and its publishing office in the country during certain hours of the night. London is the meeting-place of Parliament, the headquarters of the Empire's official life, and the great news-centre of the world. Consequently many provincial papers find it convenient to do much of their work there, using the special wire for transmission. In some cases the leading articles are written in London and telegraphed. But in any event a working corps in London can secure special reports of the speeches of local members and celebrities, and gather news of great local interest that would hardly be valued by London men—such as a deputation to Ministers, a special conference, a notable wedding, successes at the Academy or the cattle show, reports of which are always as salt to the local papers.

To some extent the telephone has already begun to tap the field, and telephones have been set up in London and country offices for the reception and transmission of news. The system will doubtless develop, and to some extent the telephone may supersede the telegraph. But at present the night telegraph newspaper service is a very formidable organisation, vast and complex in working. It may have begun with the simple principle of a hundred words for a shilling, but it means far more than that now. That is why the opposition to the proposed raising of rates was so powerful that it secured a great modification of the terms contemplated. As mutually agreed, the terms will be a shilling for a telegram of eighty words and threepence for each duplicate thereof, these enhanced rates not to take effect, however, till after 31st December 1916. It is a mere drop in the national expenditure, and probably will not seriously affect the great future of news by telegram.

THE MONTH: SCIENCE AND ARTS.

A METAL VACUUM BOTTLE.

SINCE Professor Dewar invented a vacuum flask, consisting of two glass vessels, one placed within the other, the annular space between them being exhausted of air, little progress has been recorded in this particular field of research. The inner vessel was designed to contain liquid air, the surrounding vacuum insulating the contents from outer heat, so that the highly volatile liquid within was preserved from evaporation. But this bottle was regarded merely as an interesting laboratory achievement. It was far too fragile to possess any commercial value. However, a German worker, by exploiting Dewar's idea, produced a thermal flask suited to domestic requirements which has had an extensive vogue and has proved a commercial success. But even this container suffers from the disability which characterises the Dewar bottle. Glass has to be employed, although a certain measure of protection is afforded by enclosing the whole in a light metallic case. A further improvement has now to be recorded, which, if it stands the test of time, is certain to prove of far-reaching significance, for it will provide a vacuum flask which is practically unbreakable. For many years past an American investigator has devoted his energies to the supersession of the glass by metal. Such experiments are not without precedent, and the American has not prosecuted his researches in solitary state, but he has apparently achieved the greatest measure of success. At first sight there does not appear to be any reason why metal should not be used instead of glass; but as a matter of fact the substitution presents a difficult problem. The new bottle follows the conventional design. The inner bottle is made of steel, and its internal surface, with which the contents come into contact, is lined with white porcelain enamel, so that all hygienic requirements are fulfilled. The outer shell is also made of steel, and is sufficiently heavy to withstand rough usage. The inner vessel is supported at the bottom in a special manner, and here is fixed a tube for exhausting the air. The joints are welded throughout with the electric arc, so that they do not constitute an element of weakness. Consequently, in its complete form, the bottle is exceedingly strong. It has been subjected to exacting tests, from which it has emerged successfully, and its manufacture being commercially feasible, there is every indication that it will appear upon the market in the near future.

A 'FUMED' STAIN FOR OAK.

At the moment fumed oak is enjoying a wide vogue; but changing the bright colour of the virgin wood is a somewhat costly process. The

general method is to immerse the article in a chamber or box, according to the dimensions of the piece of woodwork to be treated, and to expose it to the fumes of ammonia. The extent of change in the natural colour, perhaps to rich brown, or even to black, depends upon the duration of the exposure of the wood to the fumes. Now it is possible to obtain the fumed oak appearance in much less time and at less expense by means of a special stain which has been placed upon the market. The stain is permanent, reliable, and transparent, while the result is exactly similar to that obtained with ammonia fumes. The stain penetrates well into the wood, but does not raise the grain. It dries quickly, forming a hard and smooth surface, which is capable of taking a polish or of being varnished. The stain is made in a wide variety of shades; moreover, it can be applied to walnut with equally satisfactory results.

ECONOMY IN FOOD AND SLEEP.

Not only those anxious to respond to the demand for national thrift, but those in search of health also, will be interested in the account of his mode of life recently given by Mr William Aird to a select audience in London. He invariably slept in the open air, he told his hearers, wrapped up in a rug, in such localities as the Downs, the New Forest, and the Forest of Dean. Under conditions like these he found twelve hours' sleep in the course of a week to be quite sufficient for the maintenance of bodily health and strength. Wheat he does not need, for his diet consists of uncooked vegetables and ripe fruits. He exhibited to the audience a specimen 'dinner,' consisting of a dainty salad of small portions of carrot, cabbage, onion, parsnip, leek, watercress, beetroot, celery, and horseradish. By such a rule of life, declared Mr Aird, even those pronounced incurable by medical men might attain to perfect health and strength once more; and in proof of his assertion not only was his own experience adduced, but there were also present at the meeting several one-time 'incurables' who were now well and strong.

COBALT 'A CURIOSITY METAL.'

For many years the metal cobalt was regarded as a curiosity by scientists and as a 'nuisance' by those engaged in exploiting the mineral resources of the country around the town of Cobalt in northern Ontario. The only utilisation of this mineral was in the preparation of the pigment known as cobalt blue. But times have changed. From a curiosity, cobalt has passed into one of the most valuable alloys for increasing the strength and toughness of steel, cobalt steel, in fact, being now recognised as one of the greatest rivals to vanadium steel. Cobalt steel,

which is a British production, has been subjected to several searching tests, and in the making of tool steel for turning, planing, slotting, drilling, and milling iron and steel has proved exceedingly successful. In one test with a half-inch twist drill the cobalt steel tool drove fifteen thousand two hundred holes through a half-inch malleable casting before needing to be ground, the drill running at eight hundred and twenty revolutions per minute. In the preparation of the cobalt for combination with the steel, what is known as the aluminothermic process is practised. Although this is not the cheapest process for reducing commercial cobalt oxide, it has the advantage of giving an absolutely carbon-free metal. The oxide is combined with powdered aluminium, the mixture then being placed in a furnace of conical shape. The chemical action is started by lighting a fuse, and upon the furnace being fired the contents are raised to a white heat. The aluminium reduces the cobalt oxide, one pound of the former metal reducing and melting two pounds of metallic cobalt.

THE PAPER-PULP PROBLEM.

The recent decision of the Swedish Government to prohibit the exportation of chemical wood-pulp, together with the declared intention of the British authorities to restrict the importation of paper and paper-making materials, has produced a situation of far-reaching and incalculable effect. In all civilised countries the consumption of wood-pulp has reached enormous proportions, as its use enables newspapers, magazines, and books to be placed upon the market at a price which would otherwise be absolutely impossible. The Swedish decision affects not only these islands, but other countries as well, not excluding the United States. The forests of the great republic have been depleted of their available supplies of fir, spruce, and pine, the trees best adapted for the making of pulp, with the result that the United States, like Britain, has to depend upon foreign supplies. But Sweden's prohibition is the Empire's opportunity; and if the resources within our own boundaries be exploited upon a commercial and scientific basis, there will in the future be no need for us to go outside the Empire to make our purchases of this commodity. From the St Lawrence River and the Great Lakes stretches a vast forest, reaching well into the Arctic circle, in which the essential woods are found in abundance. Newfoundland is also rich in pulp-wood, and here, it may be mentioned, some of the largest installations of pulp-making plant in the world are in operation. Canada has virtually become the indispensable provider of wood-pulp to her wealthy neighbour. The Canadian climate is peculiarly adapted to the rapid growth of these soft coniferous trees, and by the carrying out of an organised scientific system of afforestation

coincident with deforestation an everlasting yield will be assured. In the States strenuous efforts have been made to discover substitutes for wood-fibre in the manufacture of pulp. Cotton-stalks were considered to be an excellent medium for this purpose; and if the pulp could be made from this material at a low price, not only would the country be rendered independent of Canada, but an enormous quantity of material that is now wasted would be turned to economic account. But the experiments proved that cotton-stalks could only be used for this purpose in a profitable manner when wood-pulp rose to a prohibitive figure, and so the project was abandoned. In the British Empire, however, substitutes for wood are available in vast quantities—such substances, for example, as the waste grasses to be found in northern India and Uganda, which at present hinder settlement, and are considered by agriculturists to be an unmitigated nuisance. The situation in Uganda is particularly favourable for the development of the paper-making industry, because, in addition to a superabundance of the elephant-grass, the necessary chemicals and fuel are also on the spot, and are obtainable at a low figure. In this respect our East African colony has an advantage over Sweden, which has to import both chemicals and fuel to carry on the pulp industry. Against these advantages, however, is to be set the remote situation of Uganda in relation to the world's richest markets; but this obstacle is not insuperable under ordinary circumstances, and the resources of the Empire, if properly tapped, would render us self-supporting in what is recognised to-day as an indispensable commodity.

AN ELECTRIC TORCH FOR OFFICERS.

In few trades are efforts to capture the German markets by British-made goods so active as in the supply of what may be termed electrical novelties. Formerly the greater proportion of electric torches, refills, and such like were manufactured by the enemy; but now a complete transformation has been wrought. The new industry has received a decided impetus from the stringent lighting regulations which have been brought into operation by the military authorities in the interests of national safety. Moreover, the war itself has encouraged ingenuity in this direction, because a large demand, particularly for special kinds of torches adapted to particular duties, has arisen. For instance, one firm has placed upon the market a torch of the cylindrical type, fitted with a small hood, which is pre-eminently suited for the battlefield. By means of it, maps, documents, and other communications may be studied at night with complete facility, because the light is thrown in one direction only—downwards—owing to the reflector and the bulb being set at an angle of about sixty degrees to the longitudinal axis of the torch. It is adapted to hard wear, and, being made of a non-rusting material, there

is little risk of its suffering damage from the wet. The charge is sufficient to supply light for fifteen hours continuously, and the torch will operate for twelve months without failing. One advantage of the British torches as compared with those of German manufacture is the superiority of the battery, which will keep its condition for several months, so that less risk is incurred in stocking supplies.

A NOVEL SAFETY-HOOK LINK.

A safety-hook link capable of universal application has been placed upon the market. Its outstanding features are reliability under all conditions, simplicity of operation, and the securing of immunity from accident. Both fastening and release are effected instantaneously. In general shape it resembles somewhat the familiar padlock, and the bolt is manipulated by a direct movement. The action of closing and opening is so simple as to be possible of accomplishment by a blind person or a child. Owing to the single movement, and to the sliding part being of strong construction, derangement is virtually impossible; while the link cannot become accidentally unfastened or released through carelessness. As a consequence of its novel design, the greater the pull exerted upon the link the more secure the fastening. Yet, even when the chain to which it is attached is pulled taut, the hook may be slipped. It is applicable to any condition where security combined with the possibility of instant release is desired—from the leash of a dog or the harness of a horse to the lashings of lifeboats and the couplings of vehicles.

SOLVING THE RAILWAY STATION LUGGAGE PROBLEM.

The growing scarcity of labour, which is affecting all industries indiscriminately, is drawing greater attention in these islands to time and labour saving devices. Hitherto the comparative cheapness and abundance of labour have been responsible for adherence to antiquated methods. Possibly this has been most pronounced in the handling of travellers' baggage at our railway stations, although during recent years the length of platforms has undergone considerable extension. In order to meet the unprecedented situation which has now developed, experiments are being made with power-propelled trucks, such as have been for years in operation at the busiest and largest railway termini in the United States. The trucks are of the four-wheeled type, shod with thick rubber tires to deaden the noise, and are propelled by electric motors, the batteries for the supply of the necessary current being stowed beneath the loading-deck. The trucks may be driven from either end, so that turning round is avoided; while four-wheel steering is adopted. Those in use at American stations have a carrying capacity of approximately two tons; but, to protect the motors against inadvertent overload-

ing, they are of sufficient power to handle weights of three tons. The travelling speeds range up to about six miles an hour, experience having proved this to be an adequate maximum. They are excellent for 'rush' business, which, under the conditions prevailing in this country, invariably results in chaos, owing to the employment of untrained men to meet the stress of the emergency. The truck being strongly built, and the motor being of simple design and construction, breakdowns through careless handling or lack of knowledge are practically impossible. Not only have these electrically propelled platform trolleys proved great time-savers, but they have been found decidedly economical in operation, the capital outlay being regained within a few months.

SUNLIGHT COLOUR-VALUES BY ELECTRIC LIGHT.

The increasing popularity of the half-watt electric incandescent lamp (more familiarly known as the nitrogen lamp), owing to its intense brilliancy and close resemblance to sunlight, has been responsible for a recent development which enhances the value of this form of lighting. This is the perfection of glassware for globes which give sunlight colour-values. Hence it is now possible to carry out the matching of colours by artificial light with an accuracy never before obtainable. As is well known, colour-matching with the help of artificial light is usually most difficult and elusive. But with this particular lamp the trouble vanishes. Its light, however, is not adapted to the illumination of a place reached by lights from outside, such as the interior of a shop or a warehouse, but is applicable to a room where little or no other light penetrates, so that there is nothing to interfere with the matching of the colours. Some of the globes are so tinted as to give what is described as 'noon sunlight value,' which, as the term implies, is an illumination comparable with sunlight at midday. This type of lamp-globe is recommended for the lighting of paint-shops, art galleries, colour-printing works, and so forth. Another group gives 'afternoon sunlight value,' and differs from the former in that the illumination is somewhat more yellow, thus corresponding with the yellow-tinted afternoon sunlight. This type of globe is applicable for the general illumination of shops, offices, and so forth, where a sunlight effect is desired. It may be mentioned that this glassware, which is specially prepared to meet the varying conditions, cannot be used with the ordinary metallic filament lamp, but only with its nitrogen analogue.

AN ENEMY OF THE MOSQUITO.

The conquest of the mosquito in tropical climes constitutes the essential preliminary to the settlement and development of a new district—that is, if the claims of health are to be respected.

But the elimination of the malaria-disseminating insect is apt to prove expensive, especially if the country is at all marshy. Spraying the pools and the lagoons with oil has proved efficacious, but draining is generally held to be the only reliable solution of the problem. Recently, however, an investigator who has been studying the problem, and who has carried out a number of experiments, has drawn attention to the fact that Nature herself offers the most effective remedy in the shape of the wild duck. In order to test his theory, he resided for some time in a mosquito-infected district where the marsh-land was extremely favourable to the propagation of the pests. Two ponds of equal dimensions were formed. Fish were placed in one, while ducks were encouraged to make their home upon the other. Within a short time this observer found that the pool frequented by the ducks was completely cleared of larvæ and pupæ, but that the pond inhabited by the fish was thickly infested by them. Continuing his observations, he ascertained that wherever wild ducks abound mosquitoes are scarcely to be seen, and that these birds thrive well upon the insects, preferring them, indeed, to any other food. As a result of these observations, he advocates that ducks should be introduced into areas which are now untenable owing to mosquitoes, as he believes that the birds will cope with the disease-spreading insects far more effectively than any other precautionary measures will do. If this is done, draining may be postponed until a more convenient season.

AN EXPANDING BORING CUTTER.

A tool which cannot fail to appeal to engineering shops is the new adjustable cutter of the double-ended type for finishing bored holes. The cutter consists of two high-speed tool-steel ends, with a centre connection of a special soft metal alloy. This centre-piece is partly banded by an iron or brass clip of U-shape. When the cutter, as a result of use, shows signs of wear, it can be extended to its original dimensions by hammering the alloy centre, the result of which is to compress the alloy, thus forcing the ends outwards. These can be brought dead to the gauge by the hammering process, and the U-band round the centre facilitates the true setting of the cutter to the original dimensions. It will be observed that this can be done by the man himself at his machine, so that visits to the tool-shop are rendered unnecessary, thereby materially saving time. When the alloy centre has been compressed to its maximum, it can be given a new lease of life by the insertion of a fresh centre. The outstanding advantage of this cutter, apart from the saving of time, is that the nature of the cutter is not affected, as is the case with the conventional tool, as a result of its visits to the tool-shop. Consequently this adjustable expansible tool ensures a saving

in tool-steel. The tool has been subjected to searching and prolonged tests, and it has proved to be as stiff under the heaviest work as the solid steel cutter. In one particular test a cutter of this type finished two hundred three-by-ten-inch holes in steel castings, every one of which was dead true to gauge.

A WONDERFUL MINE.

Situated in the beautiful Kaap Valley, in the Jamestown district of Barberton, Transvaal, there is a mine known by the name of Verdite. The name was given to it on account of the peculiar greenstone found in the mine, which is unknown in any other part of the globe. Articles of jewellery and ornaments are made of verdite, and it has been called the lucky greenstone of South Africa. This greenstone is a silicate of magnesia, or talc, coloured green by nature in the course of its formation. Other silicates of magnesia may be mentioned here: peridote, serpentine, meerschaum, and steatite. The mine, or, rather, hill, consists of three varieties of talc: green, white, and black. But a peculiar fact is that in the black talc there is present pure gold. Some of the finest specimens of gold-bearing rock have been found at this mine. Every one knows that gold is found in quartz, pyrites, or even in sea-water, but scarcely ever has it been mentioned in books that gold exists in talc. When the verdite rock has gone through the ordinary process of crushing and the gold has been extracted, the waste (or what is called the slimes from a gold-mine) is used in the manufacture of soap, grease, paint, paper, toilet-powders, gas-jets, electric insulators, crayons, and many other articles of everyday use. In fact, one might say that everything got from this mine can be used for some commercial purpose.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

SPRING LURE.

FAR off and faint I hear the pipes of Pan
Across the wooded hills,
Down in the valley where the daffodils,
Nodding their golden heads beside the stream,
All in the moonlight dream.

O, listen, listen to the pipes of Pan!
And now the young lambs cry,
For they have heard the music wander by
Their fold, and long to follow, far away
In fairer meads to play.

My heart is answering the lure of Pan!
O wooded hills! O vale!
I follow, follow till the stars shall pale;
Knowing he will elude me as of old,
Slip through the doors of gold
That men call morning, yet I follow still
The wild sweet piping o'er the moonlit hill.

SEVENTH SERIES

GOLD IN WAITING.

By R. S. WARREN BELL, Author of *Back from Parnassus*, &c.

CHAPTER I.

YOU know Sparcliff. You have spent halcyon days on its sands; you have picnicked under its sheer cliffs; you have promenaded beneath the myriad fairy lamps of its bandstand; you have walked in its public gardens and watched the cricket and tennis players in its spacious park; you have travelled easily and swiftly on its trams, and shopped in its wide thoroughfares. There is hardly anything wanting to contribute to your happiness and comfort at Sparcliff. But, through all the years you have known this princess of coast resorts, it is hardly likely—for why, indeed, should you have done so?—that you have ever given a thought to the fact that at some not very remote date this Sparcliff was but a village, ignored by the map, insignificant and out-of-the-way. Let me, then, tell you the tale of how the gold in waiting under its sea-sprayed grass came to be found; and how, in the course of its finding, other gold, little suspected, was passed through the crucible in which men's hearts are assayed.

In the year of Waterloo there died at the village of Sparcliff an old man named Fancit. His father had kept a shop; but Fancit, by canny dealings, and by seizing upon those opportunities that present themselves to a man who is active and open-eyed, and a good deal about the countryside, had made money, and lived, so to speak, a gentleman's life. What had been his father's shop was his private house, underlying which was a certain gruesome oddity that rendered the tenement a fit scene for strange doings. For the house would appear to have been built upon a portion of the churchyard. Its own yard was brought to a stop by the churchyard wall; the garden, likewise rearwards bounded by this wall, stretching to right and left. Fancit's father, thinking to make a cellar for the storage of his goods, came in his delving to a number of skeletons. The rector of that day, called in, said that undoubtedly the site was once part of the burying-ground, and explained how a house had risen there by the surmise that in the olden days the Miracle Players—the first Thespians—were wont to erect their booth in the churchyard; that in time the habit grew of leaving the booth there; that this light building became more substantial with the passing of years, and

with the passing of the Miracle Players was consolidated into a house; and thus, it would appear, the Fancits had become possessed of a freehold that rightly belonged to the dead. As for that Fancit who burrowed for a cellar, he covered the sketetons over with all reverence, and rested content with a basement of rather more shallow dimensions than he had intended it should have.

From the old shop-front, converted into a parlour window, John Fancit gazed upon the humdrum goings and comings of the villagers. He watched the men enter and leave the shambling, black-timbered emporium of Perriker the barber, who, being a blood-letter as well, as the colour of his pole implied, had a dignity of presence and a sense of his responsibilities that gave him a status which the modern hairdresser can never enjoy. And he watched the arrivals at and the departures from the village smithy, carried on by one Burden, a worthy fellow, who played the bass viol in church of a Sunday. And he watched the people going to little Maggs, the baker, for their loaves.

Perriker, Burden, Maggs. If you have spent any time at all at Sparcliff those names will be familiar to you. Yes, you recollect now that the park has the quaint title of 'Perriker's Land'; that the present mayor, knighted on the occasion of the opening by royalty of the Seamen's Hospital, is Sir Josiah Burden; and that Maggses abound in the borough. Was it because Maggs, maker of fine yeasty loaves, had a round dozen of children that you can't order a ton of coal, buy a pound of sugar, send a muslin gown to be laundered, or summon a plumber to patch a leaky water-pipe nowadays but you are served by a Maggs? Doubtless a trickle of the little old baker's blood is in the lot of them; but, though he died a man of substance, he had to leave his money among so many that all of his descendants could not expect to become so rich as Alderman Maggs, who owns half the High Street.

Yet these are not the greatest men of Sparcliff, for hidden within the high trees at the back of the town, and standing on ground which the wolf-builder shall never rend into plots, is Coatmayes Hall, the residence of the Lord Fancit,

who keeps grand company indeed, and by reason of his father's marriage with the Lady Lavinia Sweyn-Little, third daughter of the Marquis of Wayford, is connected with some of the proudest houses in Britain.

John Fancit, as I say, having made his money, had little to do but watch the humdrum life of the village street from his window, and await the drunken home-comings of his one son, the ne'er-do-well Ebenezer. Many men would have turned the scamp out of doors long since, especially men of Fancit's dry, hard nature; but his love for his erring child was the one soft spot in Fancit's stiff-lipped, cantankerous composition. And the boy—though he was hardly a boy now, having turned thirty—had his points. He made a fine figure of a horseman, and when out a-hunting took the stiffest fence with as little concern as he cracked a bottle, toasted a lass, or broke the head of any loon so unwise as to be impertinent to him when he was in his cups.

Fancit had married late, and then a lady who, too, was not in her first youth, and who for a number of years had been governess to the daughters of Doctor Jackaman, the rector. People said that Mrs Fancit, for all her humble position, was of the real gentlefolk stock; and perhaps this explained why the one son of the brief union—for the poor lady did not long enjoy her release from schoolroom thrall—displayed occasional flashes of refinement that stamped him as one above and apart from the majority of his boon companions. Yet that was not very strange, for he was a rough fellow at best, consorting with any that would drink and gamble with him, and only really sobering down and becoming a fairly normal member of society when he went paying court to Alice Clinkscales, a fine body of a girl, tawny-haired, and with a rare hot temper, daughter of Farmer Clinkscales, between whom and John Fancit, owing to a bitter, long-standing disagreement over a boundary fence, no word ever passed.

It was said to have been more than likely that Alice would have married Ebenezer long before this, and tamed him of much of his wildness, had not this bar existed. And some declared even that had John Fancit consented to the match, the farmer would have buried the hatchet amid the nuptial rejoicings. But Fancit was firm on this point. He would have none of Clinkscales or his wench; and the wench, out of pride, meeting him, had more than once told him

that his son was nothing to her, and that even though she loved that son as a mother her babe, she would never stoop to be daughter-in-law to such a dry-skinned curmudgeon as Daddy Fancit.

A queer set-out it all was. Rough times, too, they were, and rough people filling them.

At length John Fancit died, and no one was surprised that he left a crotchety, twisted sort of will, the gist of which came as a shock to Ebenezer, who, it appeared, was to have the house in which the old man had lived, and the furniture, and his father's various bits of property—houses, grazing-land, and so on—whose rentals would yield him an income sufficient to live on. But what Ebenezer had looked to having, the goodly sum (for those days) of four thousand pounds hard cash in the County Bank, that was not to pass to him until, to quote the odd last testament of Fancit, 'he hath kept from the drink for one calendar year;' and should he not have complied with this condition within three years of coming into his inheritance, the moneys at the bank, with interest accrued, were to be applied to the building of almshouses for the shelter of the aged poor.

Such was the salutary back-hander dealt to his scapegrace son by John Fancit. And who were the good men and true appointed to be judges of Ebenezer's sobriety, and who received fifty pounds apiece by way of reconciling them to this hardly inviting task? Why, none other than those solid and law-abiding men, Josiah Perriker, Richard Burden, and Timothy Magga. Sober men they were, and family men; friends, in a quiet way, they had been of Fancit's. So he chose them in preference to parson or doctor or lawyer. These three small men, old John had argued with himself, lived in the village street, and so Ebenezer would be beneath their very eyes. So they became judges of Ebenezer Fancit, his life; with fifty pounds apiece to joy them to the work.

And one more clause from the crotchety, twisted will must be recorded. More than one antipathy came to light in its crabbed pages; but seldom has a will, even of a man like Fancit, contained so malevolent a passage as this:

'To my son Ebenezer aforesaid I leave my ash stick with the silver head; for if he do marry that red-haired jade Alice Clinkscales, and if she do give him the tongue she hath given me, he will find my ash stick pliant and supple in the correction of her.'

(Continued on page 298.)

'COME AND HAVE A MUTTON-BIRD.'

THE SHORT-TAILED PETREL (*NEONECTRIS BREVICAUDUS*).

THERE is scarcely an inn of consequence in the length and breadth of New Zealand where one may not proffer the above douce invitation to a chum, with quick certainty of realisation;

no store of any pretension of catering to public taste where the delicacy may not be procured. We whites have not only been content, gastronomically, to follow where the Maori led, but

have proved indeed the aptest of pupils. We discovered a delicacy of exceeding daintiness, the product of an industry already organised and in full swing. It remained only to amplify and extend the operations of this industry to cope with the greater demand of the new-comers, till to-day it is safe to say that the vogue of the mutton-bird has caught on among all classes of society. The trade is growing. The number of mutton-bird lovers increases daily, and in the near future the industry bids fair to extend to far wider markets. If, in this paper, I can convey to my readers some clear idea of the working of this strange trade, and at the same time bring into the description a touch of that romance which still clings around the wild places of the earth, I shall be well content.

Out of the silences of the great Southern Ocean the birds come driving in, and no man knows exactly whence they come. It is as much a mystery as the going of the lemmings. As the nesting season approaches the myriad armies of the mutton-birds flock shoreward to seek temporary foothold on the thousand islands that dot the coast-line. It is then you may see the huge flights, winging low to the water, draw dark parallels on the seascape.

The birds, massed and disciplined into a serried whole, fly in separate bands, resembling continuous living streams that pass between sea and sky. Each army shows a front of perhaps a quarter of a mile, while its huge length stretches away and away into interminable distance. It is a wonderful sight to see one of these armies on the wing. If you care to realise the marvel, take your stand on a headland that juts into the line of flight, and watch. The sea beneath is hidden from sight. Far below one looks down upon an undulating, close-packed floor of black bird-backs streaming past. Myriad scintillations of white-tipped wings flash upward from the dark carpet like points of light. So serried are the ranks, so closely packed are the birds, that it would be impossible to drop a stone from above without bringing destruction to many of the flyers.

These bird-passages are frequently a matter of days. From dawn till dark, and on till dawn again, the army goes streaming by unceasingly. By night the noise of countless beating wings tells that it is still on the move, till at last the whirring lessens in volume; one hears the cries of the rearguard beating up the stragglers, and, as silence falls again, realises that, at last, the mighty host has passed upon its way.

As each island is reached in the line of flight contingents break away from the main body and proceed at once to the business of nest-making. No confusion accompanies the dropping out of these detachments. The manoeuvre follows a given signal. The route plan has evidently been carefully prearranged, and there is no halting of the main army. Squad after squad wheels from

the ranks at the order of the leaders, circles for a minute, and settles, till every mother-bird in the numberless host has found a resting-place.

From time immemorial the mutton-bird has ranked not only as a food staple, but as a *bonne bouche* of particular delicacy in the native cuisine; and the old-time Maori looked to this annual migration for the reaping of his harvest. The birds were netted from canoes. Paddling under the low-flying clouds, the natives thrust long shallow nets about five feet in depth, and hung on poles, upward and through the living stream at right angles to the flight-line. The plan succeeded only too well. Thousands of birds were captured at each hoist, indeed; but the destruction of brooding mothers was immense. Probably as many birds were uselessly destroyed and lost as were taken by the fowlers. At best it proved itself a wasteful and cumbrous form of procedure; and, like the Chinaman who found that, after all, arson as a means of obtaining roast-pork was open to improvement, the Maori looked about him for a more convenient and less destructive method of supply. He found it in following the birds to the nesting-places, the annual taking of a fair percentage of young birds from the parental burrows being marked by no diminution in the immigrant myriads. The young birds, too, are tender-fleshed, and, being heavily cased in fat, lend themselves readily to the peculiar process of preservation.

There is found among many of the petrels a sort of reprehensible improvidence. Quite a number of the species are content to deposit their eggs in slight depressions in sand or shingle, and to leave the subsequent hatching out very much in the hands of chance. Not so the black shear-water, or mutton-bird. Very elaborate preparation is made for the safety of the young before nesting, and there is nothing casual about the care of the mother-bird for its offspring. Each bird-family possesses a burrow of its own, pierced by strong bill and claw in the soil that covers the steeper island slopes or hangs in the clefts of the cliffs. The burrows are so made that the interiors are always dry, and many of them attain to a depth of six or more feet. One egg is laid, and both the petrel and the young bird hatched out later find in the nesting-chamber at the inner end of the burrow perfect security from raiding falcons or other enemies.

The scene presented at nesting-time on some island slope is better left to the imagination than described. The soil over perhaps a hundred acres or more is honeycombed with thousands of burrow-mouths in orderly rows. Every available foot of ground is pierced and neatly tunnelled. Picture the most populous rabbit-warren you can think of, substitute birds in millions for the bunnies, multiply a thousandfold the number of burrows, and it is possible to form some just estimate of the scene.

One cannot leave the subject of the birds'

warrens and fail to make mention of the tuatara lizard and the queer friendship that has sprung up between it and the mutton-bird. There is something almost uncanny in the intimate relations of the two creatures. It is as if a fossil had stepped, living, from the secondary strata, and, finding all its old friends dead and gone, had chummed up, *faute de mieux*, with the first of living creatures to give it house-room. For, straight from the darkness of immemorial eld into the footlights glare of a modern world-stage, *Sphenodon punctatus* seems to have come at a stride. Extinct and forgotten elsewhere for untold ages, the tuatara refuses to vanish, and insists on still surviving in limited numbers on many of the coastal islands of New Zealand. Why, or by what freakish lapse of evolutionary process, who shall say? Due to have gone with its cronies the pterodactyls and its big cousin the ichthyosaurus, it is found at the present day living amicably in the burrows of the mutton-birds. Here, like another Rip Van Winkle, it is content to pass away its days in a long sleep. Whether, now and again, the derelict saurian wakes up to stay itself with an egg or two, or a young chick, is a moot point. But, if so, it is by no means disposed to accord the same license to strangers. It fiercely resents intrusion, and has been known to fight to the death in defence of its foster-brood. Though prone to avoid hostilities where possible, it is an enemy not to be despised. Its ridged and spiny back gives it a fearsome appearance; and its strong jaws, and teeth receding in true saurian fashion, are capable of serious execution. It attains to a length of from eighteen inches to two feet, from snout to tail. But this, after all, is a digression. Let us return to our mutton-birds.

Though, since the coming of the white settlers, the mutton-bird, as an article of diet, has been unhesitatingly adopted into the menu of the country, and the annual harvest now constitutes a staple industry, it is one that owes nothing to the initiative or invention of the Europeans. The pioneers of the modern industry found it already in full swing and flourishing, and were glad to follow in the footsteps of the inaugurators. It has been found impossible to improve upon the methods of capture and preservation pursued by the Maoris in past centuries.

The young birds are taken when three-parts fledged, just prior to the migratory flight, and spade and mattock are employed to open up the deeper burrows. It is an occupation not without its dangers. Foothold on the cliffs and steeper slopes is easily lost, and a false step may be followed by a fall of hundreds of feet into fathomless sea or by a crueller death on the rocks. It requires no small nerve to keep one's head in the beat and whirl of myriad wings, and the hoarse, angry clamour from a

million bird-throats. For the parent-birds resent the abduction fiercely, fighting hard with bill and claw in defence of their young, and by many a shrewd gash on hands and face the seasoned 'mutton-birder' can bear witness to the fierceness of the combat.

The curing-station for the season is generally to be found on one of the larger islands, and, from the very nature of the work, such buildings as are erected are mainly of a temporary character. The work, so far as possible, is conducted out of doors, and a visit to one of these stations when curing is going on is an experience not to be lightly missed. Huge piles of downy, unplucked fledglings lie around, and birds in thousands litter the ground in various stages of preparation. Decapitated bodies, cleaned, and awaiting the final process, are piled up in flesh-coloured mountains. A smell of warm, uncooked poultry pervades the air, and one walks silently on a carpet of strewn feathers to chat with the handsome Maori girls and matrons engaged.

Birds in millions! birds by the ton! and, all the time, the boats come in from the neighbouring islands, their gunwales awash, with fresh cargoes of new-killed youngsters. Here comes by a man bearing a load of huge kelp or bladder-weed fresh from the wave-washed rocks, and redolent of pungent sea-scents. We follow to where a man and woman are carefully distending and blowing out the hollow kelp into big seaweed bags for the reception of the prepared birds. Airtight, tough, and flexible, these kelp envelopes retain an antiseptic quality begotten of the ozone of the outer beaches that goes far in the preservation of the contents. The Maoris were quick to recognise this fact, and certainly it would be hard to invent a cleaner or more ideal receptacle. Best of all, nature supplies them gratis in unlimited quantity in the masses of kelp fringing the rocky shores.

Lightly boiled and packed tightly to the full capacity of the seaweed bags, the birds are preserved in their own fat, and, provided the casings remain unopened, can be relied on to keep fresh and in excellent condition for ever and a day. For inland transport to distant markets the kelp bags are enveloped in a basket-ware covering of split flax, and, further protected by an end-sheathing of stiff, hard leaves of the same plant, are carried by rail, wagon, or pack-horse without injury to the contents.

Kippered or smoked mutton-birds offer agreeable variation to diverse palates. These, packed in keg or box, are handled as easily as 'Finnan haddies' or 'good red herring.' The birds are cured in long, low sheds, where, split down the back, they are seasoned, and strung, many thousands together, on long wires to smoke over green wood fires.

There is a tang of the salt sea-spaces, a smack and flavour of the wild outlands, in the meat of the mutton-bird that appeals irresistibly to the

palate of the initiate. The taste must be acquired, however. The true savour of the luxury comes not at the first essay. The very richness of the tit-bit makes over-indulgence by the novice a matter of questionable advisability. Like wine of generous vintage, it is to be taken sparingly, until one is fully inured to the potency of the draught. It is a taste, though, that comes early, and, once acquired, seeks endless gratification, and grows on what it feeds on. An inch-

thick layer of fat envelops the pigeon-sized body, and it is in the crisp crackle of this succulent morsel to the teeth that the supremest delight is attained. Like green calipash to aldermanic palate, it possesses a distinctive flavour of rare delicacy; and, in the mind of the mutton-bird gourmet, Lucullus himself never sat to finer *plat* than that of a well-smoked bird garnished with rock-oysters from Southern coasts.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER II.—THE DAILY ROUND.

I.

A CONSIDERABLE amount of art is necessary in laying out a kit for inspection; but when he had folded his clothes, and had placed the neat rolls and bundles, together with his cap-box, ditty-box, hairbrush, comb, toothbrush, type, and other small belongings, in the exact order prescribed by the clothing regulations, Martin was by no means dissatisfied with his attempt.

Now, Mr Midshipman Taut, R.N., was used to the wiles and deceptions of those men who would sooner do anything than purchase new clothes. He had known individuals who borrowed garments from their friends to make up for the deficiencies in their own kits when these were being inspected. Sometimes, to heighten the deception, they even went to the trouble of marking the loaned clothes with their own names. The regulations on the subject lay it down that blue articles shall be marked with white paint and white garments in black, each man being provided with a wooden type inscribed with his name for this purpose. But the gay deceivers had discovered that white chalk and ordinary boot-blackening were very efficient substitutes for the paint, for the temporary markings so caused could easily be brushed out before the garments were returned to their rightful owners after kit inspection. Moreover, unless the mustering officer was particularly inquisitive or suspicious, the chances were fully fifty-four to one that the deception would never be noticed.

But the midshipman, though he had left the college at Dartmouth less than a year before, was up to all these dodges. He kept the divisional clothing-book, wherein was recorded the contents of the bag of each seaman in the division, whether the clothes therein were in a state of thorough repair and cleanliness, and whether the condition of the man's hammock was 'V.G.', 'G.', 'Mod.', or merely 'Bad.' He regarded all men with a certain amount of suspicion unless he had positive truth that they

were guileless; while newly joined ordinary seamen, in particular, were brands to be snatched from the burning.

'Serge jumpers?' he asked, sucking his pencil.

'Two 'ere, sir,' said Martin, holding up a couple of neat bundles. 'An' one on.'

The officer took one, unrolled it, and lifted the square collar to look at the marking underneath. There was no deception, for the name W. Martin stared at him in large white letters. He gently rubbed it with a finger, but it did not brush off; and, holding the garment up by its sleeves, he examined it with a critical eye. There was nothing the matter with it.

'That's all right,' he remarked, handing it back, and making a note in the book. 'Let me see your serge trousers.'

One by one the articles comprising Martin's kit, even down to his 'pusser's dagger' or seaman's knife, the more intimate garments of underwear, towels, socks, toothbrush, blacking-brushes, were minutely examined. The midshipman even went to the length of producing a tape measure, wherewith he measured the distance between the three rows of tape on the collars, the depth of the V-shaped opening in the front of the jumpers, and the width of the trousers at the foot. But nothing was really wrong. One pair of socks were missing and another required darning, one flannel shirt was unwashed, a pair of white duck trousers were unmarked, and one pair of blue serge ditto were slightly wider in the leg than was permissible; but everything else was in good order and of the proper uniform pattern.

He seemed slightly surprised. 'H'm,' he observed, making further hieroglyphics in the clothing-book; 'not at all bad. Look out you keep it so.'

He went off to make his report to the lieutenant of the division, who presently arrived to make his own inspection. But he also was

tolerably satisfied, and Martin was told that he could restore his belongings to his bag, and report himself to Petty Officer Casey for work.

For many a long day Pincher was sorely puzzled by the different varieties of uniform he was called upon to wear. They were all designated by numbers, and the 'rig of the day' was always piped at breakfast-time, when the men were allowed the necessary extra minutes to change their clothes. On Sundays, for instance, the boatswain's mates, after a preliminary twitter on their pipes, would bellow, 'Dress o' the day, No. 1, an' 'ats!' This meant that the men were required to array themselves in their best blue serge suits, with gold good-conduct badges and badges of rating, and their white straw hats, for the Sunday inspection by the captain. These garments constituted the seamen's full dress, for the expensive blue cloth trousers, worn over the jumper and tied behind with black silk ribbons, had been obsolete for some time. They are retained, however, in the royal yachts; and here, also, as a distinctive mark, the men wear their badges in silver and white, instead of the customary gold and red.

Dress No. 2, Martin found, was a similar rig to No. 1, except that a cap was usually worn instead of the hat, and the badges were red instead of gold. No. 3, again, was the same as No. 2, except that the jumper was not buttoned at the wrists; while No. 4 (known as 'night clothing') was an old suit of No. 3, worn without the collar. No. 5 was of white duck, and was worn without the collar, and with a white-topped cap. The suit was washable, and hence was usually donned by men doing dirty work or in hot weather in the summer. White caps, or blue caps with white covers, both of which were kept pipeclayed for the sake of appearance, were worn at home from May to the end of September, or with white clothing at other times.

The *Belligerent*, like every other large vessel in the navy, carried a stock of ready-made garments of various sizes, besides underclothing, boots, shoes, stockings, socks, shirts, collars, rolls of serge and flannel, and sixty-and-one other articles necessary to the bodily comfort and personal adornment of the ship's company. There was hardly a thing in the clothing line which could not be obtained from the paymaster; and the 'slops,' as they were called, were issued about once a month, their value being deducted from the men's pay.

When Martin joined his first ship, toward the end of 1913, ready-made garments, supplied by the Government, were almost universally worn. Within the past fifteen years or so the blue-jackets have lost much of their original handiness with the needle and sewing-machine. It is hardly to be wondered at, for in the days of sailing-ships the men were sailors pure and simple. Now they are seamen-specialists, with an expert and highly technical knowledge of

gunnery, torpedo-work, electricity, wireless telegraphy, signals, or some other highly important subject. They are essentially busy men, with little time to spend on making their own clothes. Twenty years ago one afternoon of the week (Thursday) was always set aside as a half-holiday, or 'make and mend clothes afternoon.' Then it was no uncommon sight to see the sheltered corners of the upper deck and mess-deck crowded with men, some busy with sewing-machines, making clothes from the raw serge or duck as issued from the store; others furbishing up their wardrobes; and the rest either sleeping or looking on. The term 'jewing,' as sewing is still called, came in because the men with the machines manufactured their shipmates' clothes for a consideration, such things as 'reach-me-downs' being still undreamt of. By Pincher's day, however, the 'make and mend' day had been altered to Saturday, to allow the men to indulge at intervals in the week-end habit. Moreover, most of the clothes were issued ready-made, being afterwards altered to fit individuals by the ship's tailors, seamen with sewing-machines, who had a special aptitude for the work, and were entitled to charge stipulated sums for their labours. They were still known as 'jews,' and, like the 'snobs' (bootmakers) and the barbers, often had considerable sums standing to their credit in the savings bank.

On the afternoon of the day on which he had had his kit inspected Martin found himself detailed as a member of a working-party told off to draw stores from the dockyard. Eleven other men went with him; and, taking a small hand-cart, the little expedition set off at one-thirty p.m. in the charge of a petty officer. The rain had stopped, and it was a sunny winter day, with a touch of frost; and, as it gave him an opportunity of looking about him, Martin rather enjoyed the experience. Before joining the navy he had lived in the depths of the country, and had spent most of his days trundling the local baker's hand-cart. His experience of the sea and ships had been limited to a single visit to Skegness as a member of the village choir; and even during his training in the barracks he had seen practically nothing of men-of-war. Now for the first time in his life he came across battleships, cruisers, destroyers, torpedo-boats, and submarines at close quarters.

'Gosh!' he ejaculated, marvelling exceedingly.

'Ullo! Wot's up wi' you, Pincher?' asked another ordinary seaman, Hawkins by name. Martin had already been nicknamed, and 'Pincher,' he understood, was the sobriquet accorded to all men with his particular surname.

'I was only wonderin' to meself if'— he hesitated timidly.

'Wonderin' wot?' persisted his companion.

'Wonderin' if this was the 'ole navy. There seems plenty o' ships 'ere.'

'Lawks, 'ark at 'im!' exclaimed the other

youngster, going off into a shrill cackle of amusement. 'Jist 'ark at 'im, you blokes! Arskin' if the 'ole navy is 'ere. 'Strewth! there ain't a quarter nor a 'undredth of 'em in this 'ere bunch.'

Martin, rather ashamed of his ignorance, reddened and nodded. 'Wot's that there?' he asked, changing the subject, and pointing to a gray, cigar-shaped vessel lying in a dry dock, with dockyard 'maties' swarming on board her.

'That there 's a submarine,' Hawkins explained. 'One o' them there craft wot goes under water.'

'Gosh! She's a funny-lookin' thing. Wot sort o' blokes serves in 'em?'

'Matloes,* Pincher, the same as you an' me. They doesn't carry O.D.'s, though; only A.B.'s an' E.R.A.'s, an' such like. They get extra pay for wot they does. It's a bit dangerous like.'

Martin thought for a minute, looking interestedly at the submarine as they trundled past. 'Ow does men jine 'em?' he asked eventually.

'Ow does they qualify for 'em, d' you mean?' Hawkins queried.

Martin nodded.

'Well,' his neighbour explained, with a broad grin on his face, and inventing a still broader fiction on the spur of the moment, 'they fu'st ties a five-'underweight sinker to yer feet an' a rope round yer neck. Then they lowers you down to nineteen fathom, an' leaves you there for two minutes.—Let's see, Shorty,' he added, pretending to consider, and, turning to another ordinary seaman with a solemn wink, 'is it two minutes or three minutes they leaves yer down?'

'Three minutes, chum,' answered the other unblushingly.

'Well, they leaves you down three minutes, an' they pulls you up again, an' if yer nose ain't bleedin' they reckons as 'ow you're fit an' proper for submarines. If you are bleedin' you ain't no good—see?'

'That's a bit 'ard, ain't it?'

Martin queried innocently. 'Yus, it is a bit 'ard,' Hawkins replied, without a smile on his face. 'But then, o' course, the men wot man the submarines 'as to be extra special sort o' blokes wot 'as got plenty o' guts.'

Martin drank it all in; but at that moment the story-teller's face failed him, and he burst into uncontrollable laughter. 'Oh Pincher!' he gasped, spluttering, 'I believes you'd swaller anything any one tells yer!'

'D' you mean that wot you said ain't true?' Martin asked.

'Course it ain't, fat'ead. I wus only kiddin' yer,' guffawed the other, with tears of amusement trickling down his cheeks. 'Lawks! you'll be the death o' me yet.—Did yer 'ear wot he arsked, you blokes?'

But the 'blokes' had no opportunity of replying, for at that instant Petty Officer Simpson turned round. 'Not so much noise there!' he ordered abruptly.—'Awkins, if I sees you larfin' an' shoutin' agen I takes you before the officer of the watch when we gets back to the ship!'

Their faces fell. There was dead silence.

Rattling over the cobbled roadways and railway lines, they presently came to a store, where, in return for paper demand-notes handed in by the petty officer, they received sundry drums of paint, turpentine, and varnish. Then on again to another building, where an apoplectic-looking storekeeper condescended to allow them to load the cart still further with coils of rope and spun-yarn, and hanks of cod and mackerel line. Presently there came another stoppage to receive a bundle of broomsticks and some boathook staves. By this time the cart was heavily laden, and its manipulators were perspiring and far from cheerful; but, stopping again, they were solemnly presented with half-a-dozen shallow tin baths. They were the 'baths, sponge, thirty inches, pattern seventeen,' commonly seen suspended from the ceilings in the officers' cabins on board a man-of-war; and Martin, as he helped to drag the conveyance back to the ship, with the last consignment lodged precariously on the summit of the other articles and threatening every instant to descend in a noisy avalanche, wondered vaguely to himself if the dockyard was a sort of glorified general store, and if, by the simple presentation of a demand-note, they could obtain, say, half-a-dozen kippers or a cargo of tinned salmon. He was frightened to ask the question for fear of having his leg pulled again; but as everything else in the way of ironmongery, furniture, ship's stores, paint, rope, and blocks seemed obtainable, why not also provisions?

They got back to the *Belligerent* without further incident, and the articles were carried on board and stowed in the various storerooms.

II.

At first, until he got used to it, the regular routine of the ship was not altogether to Martin's liking. At five-thirty each morning they were all roused out of their warm hammocks by the strident shouting of the boatswain's mates and ship's corporals. 'All hands! turn out, turn out, turn out! show a leg, show a leg, show a leg!' they yelled with insistent monotony. He soon learnt, from being shot violently out of his hammock, and from sundry threats of being taken before the officer of the watch for slackness in turning out, that it did not pay to disregard the noisy summons to wake up. Other men had tried the game, and it generally ended in their being turned out at five A.M. for several days together.

By five-forty-five, therefore, Martin had stowed his hammock, had given his face and neck a per-

* The term 'matlo,' derived from the French for 'sailor,' is always used by bluejackets in referring to themselves. E.R.A. = engine-room artificer.

functory dab with a damp towel, and was having a bowl of steaming hot ship's cocoa in his mess. Splendid stuff this, so thick that a spoon would nearly stand upright in it; and he little realised that the long-suffering cooks were turned out of their hammocks at about three each morning to prepare it. The cocoa was issued in large slabs the best part of an inch thick. It was the best of its kind; and though it required a deal of boiling, it was an excellent drink wherewith to start the day's work.

At six o'clock both watches were piped to fall in on the upper deck; and when parties had been told off for various other odd jobs, the rest of the men were detailed to scrub decks under

the supervision of their petty officers. Cold work this, with the thermometer nearly down to freezing, the hoses spouting water, and one's feet bare and trousers turned up to the knee. Lines of men armed with hard, short-haired brooms went solemnly up and down scrubbing as they went, and woe betide the hapless individual who did not exhibit the necessary energy! On Saturdays the routine was varied, for then the decks were sprinkled with sand and were well holystoned. This work was more back-breaking and chilly than ever, for one had to get down on one's knees and manipulate a heavy holystone in each hand.

(Continued on page 301.)

CAPTURED BY GERMANS IN MID-OCEAN.

By ONE OF THE CAPTURED.

TO be captured in mid-ocean, and to have your ship sunk by an enemy cruiser, is an experience which has its interesting side, and one not likely to be forgotten; but it also has other aspects decidedly unpleasant. The stay-at-home Briton will perhaps hardly realise how madly exasperating it is to be one of a company in a large British passenger-boat, crowded with Americans and other neutrals, who suddenly find themselves made prisoners by a vessel flying the detestable German flag; to see one's own national emblem torn down, and the symbol of rapine and cruelty hoisted in its stead; while for hours one casts one's eyes in vain over the wild waste of waters, longing for a sight of that which had always been the pride and boast of every British heart. At such a moment, while listening to the sneers of the foreigners around, it is not to be wondered at if one's *amour propre* is deeply, even if somewhat unreasonably, wounded, and that the captured feel inclined to 'grouse' at the British navy for not devoting a larger share of its attention and watchfulness to their little affair.

It was on a day late in October 1914 that the *Karlsruhe*—the German cruiser whose end, coming as it did about three weeks later, has been such a mystery—quietly came across our bows and ordered us to stop.

Our vessel was one of the finest British passenger and freight boats sailing regularly between New York and Buenos Aires, and had reached a point on the northward journey within three days' steaming of Barbados. Before we left Buenos Aires it had been openly stated that we should be captured; but, British-like, we rather despised such warnings, and, so far as I could judge, we appeared to go little, if at all, out of the usual track followed by vessels sailing between the Plate River and New York.

Of course, we sighted the *Karlsruhe* some time before she came up to us, but nothing like soon enough to give us even a hope of escaping. As

a matter of fact, the ship's officers seemed so little conversant with maritime types that even with glasses they appeared unable until the last moment to make up their minds whether the stranger was French, Russian, British, or Japanese.

The summons to surrender was a never-to-be-forgotten experience; and the silence seemed strained and tense when our mighty vessel stopped her engines for the last time as a British ship, and the foreigner—her name, by the way, was painted out—slowly hoisted the German naval ensign. To say that there was consternation writ on every face would be to put it mildly! And yet, if it had not been for us Britishers so tragic, the adventure would have had a distinctly humorous side. The vast majority of the passengers were Americans, and during the entire voyage many of them had expressed their disappointment at the lack of the promised excitement, and their hope of seeing at least the funnel of a German cruiser, if only to relieve the monotony of danceless evenings and the many hours of dark decks and dimmed lights. Now that the phantom had realised, and delay and annoyance—perhaps worse—stood in front of them, the matter wore a different aspect.

At the same time, it is only fair to say that there was not the slightest panic, even if the steerage passengers were inclined to be restless for a while. Indeed, the only person I saw weeping was, strange to say, a German woman who occupied a second-class cabin. Perhaps her example would have been more largely followed if the women could have foreseen some of the privations they were to suffer before arriving at New York.

The first thing the Germans did on coming aboard was to seize all the money in the purser's keeping, which they characteristically carted off at once. Their second proceeding was to have a good drink of beer, a luxury which they said had not been theirs for weeks.

Within an hour or two specks arose on each quarter of the horizon, and these presently resolved themselves into four convoys of the *Karlsruhe*. Two of them were captured British tramp steamers, while the others were small German freight and passenger boats. It was more than a little distressing to see our own boats come circling around us. Although their names had been slightly painted over, they were still plainly discernible. We knew that each contained a number of our imprisoned countrymen, and we should have liked to give them a cheer of encouragement; but, with the exception of a man on the bridge, not a soul was visible. Not a sound was heard, and the vessels came slowly gliding past us like floating coffins.

We then learned the manner of our capture, which illustrated once more the undoubted ingenuity of the Germans. If the *Karlsruhe* had pursued us unattended we might possibly have evaded her. So she stretched across our path a line of convoys which had crept out of Brazilian ports by stealth in the dead of night. Each of these innocent-looking vessels had a barrel with a man provided with powerful glasses inside it strung right to the top of the mast, so as greatly to increase his range of vision. The *Karlsruhe* remained at the end of this long line, and directly we were sighted the signal was flashed from one to the other till it reached her, and then, with her greatly superior speed, she could successfully run us down.

To the surprise of many, we did not, on realising her identity, send out a single 'wireless' for assistance, on the grounds that either our message would have been 'jammed' or blurred by the enemy, or it would have brought other merchant ships to our aid, who would then probably have been captured and met our own fate.

We had spoken to a British man-of-war some three days previously, and had seen her for more than a day in our wake, and one cannot but regret that apparently a given signal had not been decided upon in the event of our requiring her assistance. She would probably have had time to come up, as the fate of our ship hung in suspense for nearly two days, during which time the *Karlsruhe*, her convoys, and ourselves were lying without movement on the ocean.

The true Briton is never long depressed by any series of untoward circumstances; and although for some hours it was doubtful whether we should be transported to the African coast and landed on some out-of-the-way island, kept prisoners for weeks on a tiny vessel, or even put into small boats and left to find our way to land, we soon recovered our spirits sufficiently to garner some small amusement out of the situation. Some of the passengers found, goodness knows where, a small balloon, somewhat larger than those used by children. To this they attached a long tail of thick twine, at the end of which was tied a message wrapped in oilskin.

They let this go from the second-class deck, while the Germans at the other end of the ship were too busy collecting spoils to notice anything. The balloon sailed away over the ocean in first-rate style, with the message containing our appeal trailing a foot above the water. Suddenly the *Karlsruhe* herself took alarm, and made frantic signals to the German officers on board our vessel. These immediately jumped into their only steam-pinnace which was alongside, and started in pursuit, to the accompaniment of laughter and ironical cheers, not to mention the offering and taking of odds as to their success. For a couple of miles it was a neck-and-neck race, and then the Germans slowly overhauled their objective, and prepared to capture it. But just as the man in the bows of the pinnace prepared to grasp the end of the trailing tail the wind freshened, and he missed his aim and his balance at the same time, falling headlong into the water. By the time he was recovered, the balloon had sailed gaily out of sight, and the Germans reluctantly gave up the chase. If any vessel subsequently caught sight of that baby balloon careering over the wild waste of waters, her officers must have wondered what terrible tragedy had occurred.

Many of the passengers, to show their spirit and their fearlessness of the Germans, although in the very jaws of the tiger, would sit down at the piano and burst into patriotic melodies, such as 'Tipperary' and 'Rule Britannia' (even though the latter did sound a trifle out of place under the circumstances). The Germans finally forbade this ebullition of patriotism, a fact which rankled much in the mind of one of the crew. He was a big, burly, and usually good-natured man, hailing, I think, from the butchers' department, and I shall never forget seeing him march up to the piano an hour or two before we were deported, when the Germans were all busily engaged elsewhere, carrying in his hand something between a pole-axe and a sledge-hammer. He was determined that if the piano never played 'God Save the King' again, it certainly should never sound 'The Watch on the Rhine.' Raising his weapon high in the air, and whirling it over his shoulder, he brought it down with resounding force on the ivory keys, smashing them to bits, and snapping the wires like pieces of twine.

During the two days that we remained on board our own vessel, our refrigerating pipes and cylinders, together with great quantities of meat, were transported to one or other of the enemy vessels. Ultimately we were informed that the Germans needed our boat, and that the passengers and crew, together with all their portable belongings, would be transferred to a smaller vessel. This concession regarding personal property was intended to conciliate and pacify the American passengers; and I have little doubt that if all or even the

majority had been British, few would have been allowed to take many of their belongings.

This transportation over the waves in a heavy swell took a day and a half, and formed a scene worthy of a painter's brush. The decks were piled high with luggage of every kind and description, which was lowered or dropped into the small boats—or into the water, as chance dictated. The boats were then rowed or towed over the mile or so of intervening sea which separated us from our future home.

The Germans tried to make use of our own lifeboats; but, alas! as soon as they were lowered into the water they took such a liking for it that they endeavoured to investigate its lower depths with great success. The official reason for this accident given out in New York was that the cocks or plugs had not been placed in the boats before they were lowered.

While the German sailors were at work one could not but be struck with their linguistic abilities. Among all the crew of the *Karlsruhe* I did not meet one who did not speak English in some measure. Most of them spoke it excellently, some faultlessly. With the exception of a few passengers of German extraction, who seemed highly delighted at the turn affairs had taken, not a soul among us knew a word of the language of the 'Fatherland.'

The rope attached to the lifeboat in which I was being towed over the ocean broke; and the little German cutter, having other matters to attend to, left the boat, crammed full of people, without any oars, to drift broadside over the swell for an hour. Most of the occupants were violently sick, and in the clear green water the sharks all around were nearly on speaking terms with us. Not altogether a pleasant experience!

Before leaving the ship every man had to sign a declaration not to take up arms against Germany. Whilst this formality was being gone through in the first-class dining-saloon before a board of German officers, one of the stewards gave audible expression to a pious wish concerning the future welfare of the Kaiser and his posterity which did not seem to commend itself to the Huns. Rising in stately and horrified silence, they left the saloon, and subsequently informed us that unless we behaved ourselves we should be placed in small boats and left to drift about the ocean. The compulsory signing of this declaration also brought forth a fine act of daring from our Irish captain. Addressing his crew assembled in the saloon before the German officers, he told them, with the tears trickling down his cheeks and emotion in his voice, that their fine vessel had been captured and was doomed, that they were all prisoners, and that he was a commander without a ship. 'Boys,' he continued, 'you are now to be made to sign this form that you will not at any future time take up arms against the German Government. You are non-combatants, and you ought not to be

asked to sign such a form. It is not voluntary, it is compulsory; and therefore, as no good would accrue from the refusal to sign it, I advise you to do so. But I am sure that a signature under such circumstances will carry no moral weight with you, and I entreat you, the instant you touch British soil, to go to the nearest recruiting office, enlist, and then away to fight the Germans like hell.'

The intensely dramatic nature of the scene was intensified by a yell of defiance that nearly shattered the decanters on the sideboard; whereupon the captain slowly strode out of the saloon, leaving the German officers white with fury and scarce able to control themselves.

The gallant captain was probably forgetting the strict adhesion to the letter and spirit of International Law which the British Government is observing with such exactitude; but his declaration showed, at all events, his supreme disregard for personal consequences.

I should like to state, and this despite all the rumours to the contrary which were subsequently circulated in New York, that the discipline of the British crew was excellent, and was maintained from the moment the Germans boarded the ship, although, theoretically at any rate, as prisoners of war, all were equal, and Jack was as good as his master, till the time, a month later, when the ship's company was split up in various sections for different ports.

There is no doubt that the Germans were heartily sick of us before they had finished with us. They informed us that we were the only passenger-boat they had captured, and if they saw another they would put the blind eye to her, unless, as in our case, they were very hard pressed for meat and ice. They also told us that, despite their speed, which was greater than that of the British cruisers opposed to them, their circle of activity was steadily being narrowed, and that about another three weeks would be the length of their tether. They were quite frank about it; and I am disposed to ask, was it altogether a coincidence that three weeks later, almost to a day, the *Karlsruhe*, without British aid or intervention, was destroyed in a manner that is yet a mystery to be unravelled? I only state the facts.

At the time of our capture the condition of the *Karlsruhe's* rudder was apparent to the eye of a novice. It had evidently been shot away and a temporary structure of wood hastily improvised. This, they told us in high glee, had been occasioned by H.M.S. *Glasgow* a week or so previously. The *Glasgow* was a cruiser of heavier calibre than the *Karlsruhe*, but slower by several knots, and in a running fight had done this damage in the endeavour to disable her opponent. Unknown to the *Glasgow*, however, the *Karlsruhe* was almost out of coal when they met. To escape, nearly everything combustible was sacrificed to the furnaces. Even then, the Germans

asserted, another half-hour would have seen them finished for fuel; but, to their relief, the *Glasgow*, seeing no chance, with her inferior speed, of closing up the separating gap, which was naturally becoming wider, gave up the chase. The slow speed of her outlying cruisers probably cost Britain many millions of pounds in the early part of this war.

On the 28th October, after fifteen hours of strenuous labour, the transportation of passengers and crew was complete; and, just as the disc of the tropical sun began slowly to sink below the western horizon, six hundred weary, depressed, and hungry passengers (many of whom had had but two hasty meals during the last forty-eight hours, and few of whom had had any sleep) gathered together on the deck of what was to be their prison home for the next ten days, to take a last look at the noble vessel out of which they had just been cast.

The wind and the swell on the ocean were going down with the sun, and in the calm, clear atmosphere she appeared a veritable 'painted ship upon a painted ocean.'

The German flag, after having been hoisted in the first place to denote possession, had been taken down, probably to avoid being a distinguishing mark which would frighten any other stray British vessel away, or bring an unwelcome visitor too close. But now, as the gloom gathered in, and our odorous boat began slowly to make way through the water, there fluttered to the flag-pole in the stern the German naval ensign, as though to bid us an ironical good-bye, whilst the Britons amongst us uttered thoughts that cannot be written down.

And what of her fate? For all I know it may still be officially in doubt. Indeed, for the next three months it was said in New York that she was being used as a store-ship in one of those bases which the Germans secretly maintained on the lonely coast of the South Atlantic. This I do know, however. On the second day out on our little pleasure trip, one of our own officers informed me that a wireless had been received from the *Karlsruhe* that she had sunk the liner. I have always believed this to be correct, as she was too large a vessel to be of much use to the *Karlsruhe*, except in the possible character of a decoy.

The vessel on which our entire ship's company was placed was the *Asuncion*, a small steamer usually trading between Hamburg and South America. She had been held up at Santos for dues, but in response to the *Karlsruhe's* signal had taken 'German leave' at night without papers. All the sailors on this boat, as well as those on the *Karlsruhe*, were apparently in a very optimistic frame of mind, although I am not quite certain that their cheerfulness was altogether genuine. Paris, they asserted, was taken; Turkey had declared war against Britain; India and South Africa were

in revolt. The war, they declared, would soon be over, and they would all be home for Christmas. My strong impression was that their officers deliberately foisted all this 'news' on the men to keep them quiet, as there was no doubt that many of them, even at this stage, with little chance of getting home save through the defeat of Britain, were terribly home-sick.

So far as our own troubles were concerned, they had only just commenced. The *Asuncion* was a boat with accommodation under ordinary circumstances for thirty first-class passengers and a number of steerage passengers. We were nearly six hundred in all, with a good number of women of all classes. The few first-class cabins were soon allotted; but they were very small, and in the tropical climate nearly unbearable. It was better to sleep, as did the vast majority, on deck, save that the decks had not been washed down since the boat left Hamburg, some three months earlier, and that there were nothing like enough mattresses to go round. If any one has tried to sleep for several nights in succession on chairs or hard decks, he will realise what our women especially must have suffered. Many of them walked about half the night, until, dead-tired, they dozed off where they were.

As regards food we were not much better off. The cold water and ice ran out on the first day, and thenceforward we could only moisten our parched tongues with a little warm brackish water. Whether under the circumstances it was equitable or not is a moot matter; but what little good food there was the first-class passengers were given in dribbles in the small saloon. The rest of the ship's company and crew were served at the hours of eleven o'clock in the morning and five in the afternoon with a little meat—the smell of which, without ice to preserve it, soon permeated the ship—cooked in water, a chunk of bread, and a horrible sickly liquid called coffee. This had literally to be fought for, the hungry crowd was so great and eager; and those who had not had the foresight to bring away with them from our own boat tin plates and utensils stood little chance, as there seemed to be no such thing as crockery ware on the *Asuncion*.

This condition of things lasted some eight or nine days, whilst we slowly wandered at two or three knots, first some thirty miles north, and then the same distance south again. This was done not to allow the *Karlsruhe* time to escape, but to give her sufficiently wide scope to capture other vessels.

In justice to the German officers of the *Asuncion*, it should be said that they did all in their power to alleviate the distress, and gave up their own cabins to the women. But you cannot make bread without dough! Our ship's band was the means of illustrating the curious blend which forms the German character. The

officers of the *Karlsruhe* were so delighted to have a little music on coming aboard us that they insisted on the utmost care being taken of the musicians and their instruments, even to the extent of their being safely transported to the *Asuncion* before the women and children, and in the best lifeboat that could be got. It was the same amongst the German officers of the *Asuncion*, whose chief regret in their somewhat hunted mode of life was the deprivation of their beer and their music which it entailed.

On the tenth day after our capture, standing on the aft poop-deck late in the afternoon, as the sun was about to sink below the horizon, I saw four faint pillars of smoke against the glowing sky. Fetching a powerful pair of glasses, I distinctly made out the four funnels of the *Karlsruhe* and a portion of her hull motionless on the ocean. So far as I am aware, this was the last occasion on which this mystery ship was beheld by British eyes.

The next day we were cheered up by observing that a different course was being taken and more rapid progress was being made, and soon we entered the mouth of the Amazon on the way to Pará. During our course up the river we passed a Booth liner outward bound for England. She was plainly puzzled to see a German liner crowded with people waving tablecloths and handkerchiefs, and singing 'Tipperary' and 'Rule Britannia,' and it was not until she passed that her officers seemed to grasp the situation, and hastily ran up the Union-Jack to an accompaniment of cheering.

Pará is a town that since the rubber boom ended has had a somewhat stagnant career. All the more reason, therefore, it would be thought, for gladly welcoming a shipload of people necessarily bound to spend money. But its reception of us was decidedly cool. For nearly two days the Brazilian officials kept us in the river, running round us in their little doll's-house flat-bottomed gunboats, shouting '*Allemand! Allemand!*' while the authorities frantically telegraphed to all parts of their mighty scattered empire for instructions in such an unlooked-for responsibility. Their chief objection to us, I gathered, was that so large a number of extra people thrown on the town would send up the price of provisions to such an extent as to cause a famine. Doubtless we should have been anchored in the river till this day if our German captain had not taken the Brazilian bull by the horns, and declared that at a certain time he would proceed to land his passengers. They then threatened to sink us if we stirred, and many people hastily made provision for such a possible emergency, and became particularly keen as to the nature of the man-eating fish that inhabited the river. At the appointed hour, however, we moved up to the town quay, the Brazilians following and protesting vigorously. How short-sighted their policy was was soon evident, for Pará enjoyed a boom beyond any-

thing in recent years. The big languishing hotels, which were built in days when unlimited wealth and prosperity seemed to be the town's future, were once more filled, and their glories revived, by our first-class passengers, who lived there, and by the British colony who came to welcome them.

The remainder of the passengers and crew were taken charge of by the British Consul, and housed in two of those long, three-tiered, flat-bottomed river boats which ascend the Amazon for the greater part of four thousand miles. These were anchored in the river, but frequent tugs conveyed their occupants to and from the shore, and the hungry passengers did not fail to take advantage of the opportunity to supplement the two scanty meals a day that were still their prescribed lot.

There was no doubt, also, that the pawn-brokers of Pará, or those gentry who pursue an analogous business there, did a roaring trade in silver and plated goods, which large numbers of the crew of the liner suddenly produced from the depths of their trunks or other receptacles, the monogram on all the articles being the same. The morality of the transaction may have been faulty, but most people will agree that the plate served a better purpose than if it had fallen into German hands, or had been left to rust at the bottom of the sea.

True to their instinct, the first thing the British passengers did on stepping ashore was to organise an international festival of sports. The place of meeting was decorated with the British and American flags entwined, military bands were in attendance, and the festival was thoroughly enjoyed by large crowds of cheering spectators, to the utter astonishment of the spectated members of the German colony. True that in the football match our men, worn out by want of sleep and food, and by the temperature, which stood at ninety-five degrees in the shade, were quite beaten; but they gave Brazilians and natives a taste of the indomitable character of the Briton, and his ability to rise superior to circumstances, which will not, I venture to think, be forgotten by that far-off town of Pará for many a long day.

A note appeared in the press on the subsequent history of the *Asuncion*, in detention by the Brazilian Government for various mercantile misdemeanours and unpaid dues. As late as 10th February of this year, it was stated that this steamer, detained in the harbour of Belem, attempted to put out to sea in a fog, and only stopped when she was fired upon. The captain subsequently explained that he had no intention of escaping. What this declaration is worth can be imagined! Has this attempted escape anything to do with the daring raids of the new German pirate, the *Moewe*? Was the *Asuncion* summoned from port for the same purpose as when she was called out by the *Karlsruhe* to receive prisoners of captured or sunk vessels?

THE DAY OF WRATH.

A STORY OF 1914.

By LOUIS TRACY, Author of *The Final War*, *Rainbow Island*, *The Terms of Surrender*, &c.CHAPTER XIII.—*continued.*

IT is an oft-repeated assertion that a drowning man reviews the whole of his life during the few seconds which separate the last conscious struggle from complete anæsthesia. That may or may not be true, but Dalroy now experienced a brain-storm not lacking many of the essentials of some such mental kinema.

Think what that swinging rope, with its unseen human agency, meant to a captive in his hapless position! It was simply incredible that one man alone would attempt so daring an expedient. Not only, then, were a number of plucky and resourceful allies concealed in the loft, but they must have been hidden there before the detachment of Death's-Head Hussars occupied the barn beneath. Therefore, they knew the enemy's strength, yet were not afraid. That they were ready-witted was shown by the method evolved for the suppression of that blatant Teuton, Von Halwig. It was evident, too, that they had intended to lie *perdu* till the cavalry were gone, but had been moved to action by a desire to rescue the bound Englishman who was being twitted so outrageously on his own and his country's supposed misfortunes. Who could they be? Were they armed, and sufficiently numerous to rout the Germans? In any event, how could they deliver an effective attack? He, Dalroy, took it for granted that the imminent strangulation of the Guardsman, if successful, was but the prelude to a sharp fight, since Von Halwig's death, though supremely dramatic as an isolated incident, would neither benefit the prisoners nor conduce to the well-being of the people in the loft. How, then, did they purpose dealing with a score of trained soldiers, who must already be fidgeting in the rain, and whose leader, the corporal, might look in at any moment to ascertain what was delaying the young staff captain? Discipline was all very well, but these hussars belonged to a crack regiment, and their colonel would resent strongly the needless exposure of his men and horses to inclement weather. Moreover, how easy it was for the corporal to convey a polite hint to Von Halwig by asking if the chauffeur should not turn the car in readiness for his departure!

All this, and more, cascaded through Dalroy's brain while his enemy was lighting the second cigarette. He was in the plight of a shipwrecked sailor clinging to a sinking craft, who saw a lifeboat approaching, yet dared neither look at nor signal to it. He must bend all his energies now to the task of keeping Von Halwig occupied. What would happen when the noose coiled

around the orator's neck? Would it tighten with sufficient rapidity to choke a cry for help? Would it fall awkwardly, and warn him? Were any of the troopers so placed that they could see into that section of the barn, and thus witness their officer's extraordinary predicament? Who could tell? How might a man form any sort of opinion as to the yea or nay of a juggler's feat which savoured of black magic?

Dalroy gave up the effort to guess what the next half-minute might bring forth. Those mysterious beings up there needed the best help he could offer, and his powers in that respect were strictly limited to two channels—he must egg on the talker; he must not watch that rope.

'I am ready to admit Germany's strength on land,' he said, resolutely fixing his eyes on an iron cross attached to the Prussian's tunic above the top button. 'That is a reasonable claim. How futile otherwise would have been your twenty years of preparation for this very war! But my mind is far too dense to understand how you can disregard the English Channel.'

'The *English Channel*!' scoffed Von Halwig. 'The impudence of you *verdammt*— No; it's foolish to lose one's temper. Well, I'll explain. The really important part of the *English Channel* is about to become German. For a little time we leave you the surface, but Germany will own the rest. Your navy is about to receive a horrible surprise. We've caught you napping. While Britain was ruling the sea we Germans have been experimenting with it. Our visible fleet is good, but not good enough; so we allowed your naval superiority to keep you quiet until we had perfected our invisible fleet. We are ready now. We possess three submarines to your one, and can build more, and bigger, and better under-sea boats than you. Do you realise what that means? Already we have sunk four of your best cruisers, and they never saw the vessel that destroyed them. We are playing havoc with your mercantile marine. Britain is girdled with mines and torpedoes. No ship can enter or leave any of your ports without incurring the almost unavoidable risk of'—

A rat scampered across one of the speaker's feet, and startled him.

He swore, dropped the cigarette, and lighted another, the third. Like every junior officer of the German *corps d'élite*, he had sedulously copied the manners and bearing of the commis-

sioned ranks in the British army. But your true German is neurotic; the rat had scratched the veneer. Meanwhile the rope rose quickly half-way to the trap-door; it fell again when Von Halwig donned the prophet's mantle once more.

'We can not only ruin and starve you,' he said exultantly, 'but we have guns which will beat a way for our troops from Calais to Dover against all the ships you dare mass in those waters. We have you bested in every way. Each German company takes the field with more machine-guns than a British regiment. We have high explosives you never heard of. While you were playing polo and golf our chemists were busy in their laboratories.'

His voice rose as he reeled off this litany of war. His perfect command of English was not proof against the guttural clank and crash of German. He became a veritable German talking English, rather than an accomplished linguist using a foreign tongue. Oddly enough, his next tirade showed that he was half-aware of the change. 'Old England is done, Captain Dalroy,' he chanted. 'Young Germany is about to take her place. The world must learn to speak German, not English. Six months from now I'll begin to forget your makeshift language. Six months from now the German Eagle will flaunt in the breeze as securely in London as it flies to-day in Berlin and Brussels, and, it may be, in Paris. If I'm lucky, and get through the war— *Gott in Himm*!—'

With a sudden vicious swoop the noose settled on Von Halwig's shoulders, and was jerked taut. A master-hand made that cast. No American cowboy ever placed lasso more neatly on the horns of unruly steer. At one instant the rope was swinging back and forth noiselessly; at the next, rising under the impetus of a gentle flick, it whirled over the Prussian's head and tightened around his neck. He tore madly at it with both hands, but was already lifted off his feet, and in process of being hauled upward with an almost incredible rapidity. There was a momentary delay when his head reached the level of the trap-door; but Dalroy distinctly saw two hands grasp the struggling arms and heave the Guardsman's long body out of sight.

An astounding feature of this tragic episode was the absence of any outcry on the victim's part. He uttered no sound other than a stifled gurgle after that half-completed exclamation was stilled. Possibly his dazed wits concentrated on the one frantic endeavour—to get rid of that horrible choking thing which had clutched at him from out of the surrounding obscurity.

And now a thick knotted rope plumped down until its end lay on the floor, and a rough-looking fellow, clothed like Maertz or Dalroy himself, descended with the ease and agility of a monkey. He was just the kind of shaggy goblin one might expect to emerge from any

such hiding-place; but he carried a slung rifle, and the bewildered prisoner, taking a few steps forward to greet his rescuer, realised that the weapon was a Lee-Enfield of the latest British army pattern.

'Arf a mo', sir,' gurgled the new-comer in a husky and cheerful whisper. 'I'll 'old the rope till the next of ahr little knot 'as shinned dalin. Then I'll cut yer loose, an' we'll get the wind up ahtside. Didjever 'ear such a gas-bag as that bloomin' German? Lord luv' a duck, 'e couldn't 'arf tork! But Shiney Black, one of ahrs, 'as just shoved a bynit through 'is gizzard, so *that* cock won't crow ag'ine!'

Dalroy owned only a reader's knowledge of colloquial cockney. He inferred, rather than actually understood, that several British soldiers were secreted in the loft, and that one of them, named 'Shiney Black,' had closed Von Halwig's career in the twinkling of an eye.

By this time another man had reached the ground. He seized the rope and steadied it, and a third appeared. The first gnome whipped out a knife, freed Dalroy, unslung his rifle, and picked up the electric torch, which he held so that its beam filled the doorway. Man after man came down. Each was armed with a regulation rifle; Dalroy, for once thrown completely off his balance, became dimly aware that in every instance the equipment included bayonet, bandolier, and haversack.

The cohort formed up, too, as though they had rehearsed the procedure in the gymnasium at Aldershot. There was no muttered order, no uncertainty. Rifles were unslung, bayonets fixed, and safety catches turned over soundlessly.

Conquering his blank amazement as best he could, Dalroy inquired of the first sprite how many the party consisted of, all told.

'Twelve an' the corp'ral, sir,' came the prompt answer. 'The lucky thirteen we calls ahrselves. An' we wanted a bit o' luck ter leg it all the w'y from "Monz" to this 'ole. Not that we 'adn't ter kill any Gord's quantity o' Yewlans when they troied ter be funny, an' stop us— Here's the corp'ral, sir.'

Dalroy was confronted by a clear-eyed man, whose square-shouldered erectness was not concealed by the unkempt clothes of a Belgian peasant. Carrying the rifle at 'the slope,' and bringing his right hand smartly across to the small of the butt, the leader of this lost legion announced himself.

'Corporal Bates, sir, A Company, 2nd Battalion of the Buffs. That German officer made out, sir, that you were in our army.'

'Yes; I am Captain Dalroy, of the 2nd Bengal Lancers.'

Corporal Bates became, if possible, even more clear-eyed.

'Stationed where last year, sir?'

'At Lucknow, with your own battalion.'

'Well, I'm— Beg pardon sir, but are you

the Lieutenant Dalroy who rode the winner of the Civil Service Cup?'

'Yes, the Maharajah of Chutneypore's Diwan.'

'Good enough! You understand, sir, I *had* to ask. Will you take command, sir?'

'No indeed, corporal. I shall only humbly advise. But we must rescue the lady.'

'I heard and saw all that passed, sir. The Germans are mounted. The lady's in the car. We were watching through a hole in the roof. The last man remained there so as to warn us if any of 'em came this way. As you know their lingo, sir, I recommend that when we creep out you tell 'em to dismount. They'll do it like a shot. Then we'll rush 'em. Here's the officer's pistol. You might take care of the shuffer and the chap by his side.'

'Excellent, corporal. Just one suggestion. Let half of your men steal round to the rear, whether or not the troopers dismount. They should be headed off from Oombergen, the village near here, where they have two squadrons.'

'Right, sir.—Smithy, take the left half-section, and cut off the retreat on the left.—Ready, sir?—Douse that glim!'

Out went the torch. Fourteen shadows flitted forth into the darkness and rain. The car, with its staring headlights, was drawn up about thirty yards away, and somewhat to the left. On both sides and in rear were grouped the hussars, men and horses looming up in spectral shapes. The raindrops shone like tiny shafts of polished steel in the two cones of radiance cast by the acetylene lamps.

Dalroy, miraculously become a soldier again, saw instantly that the troopers were cloaked, and their carbines in the buckets. He waited a few seconds while 'Smithy' and his band crept swiftly along the wall of the barn. Then, copying to the best of his ability the shrill yell of a German officer giving a command, he shouted, 'Squad—dismount!'

He was obeyed with a clatter of accoutrements. He ran forward. Not knowing the 'system' perfected by the 'lucky thirteen,' he looked for an irregular volley at close range, throwing the hussars into inextricable confusion. But not a rifle was fired until some seconds after he himself had shot and killed or seriously wounded the chauffeur and the escort. For all that, thirteen hussars were already out of action. The men who had crossed Belgium from Mons had learnt to depend on the bayonet, which never missed, and was silent and efficacious.

The affair seemed to end ere it had well begun. Only two troopers succeeded in mounting their plunging horses, and they, finding the road to Oombergen barred, tried to bolt westward; whereupon they were bowled over like rabbits. Their terrified chargers, after scampering wildly a few paces, trotted back to the others. Not one of the twenty got away. Hampered by

their heavy cloaks, and taken completely by surprise, the hussars offered hardly any resistance, but fell cursing and howling. As for the pair seated in front of the car, they never knew why or how death came.

'Now, then, Smithy, show a light!' shouted Corporal Bates. 'Ah! there you are, sir! I meant to make sure of *this* chap. I got him straight off.'

The torch revealed Corporal Franz stretched on his back, and frothing blood, Bates's bayonet having pierced his lungs. It had been better for the shrewd Berliner if his wits had been duller and his mind cleaner. Not soldierly zeal but a gross animalism led him in the first instance to make a really important arrest. His ghoulish intent was requited now in full measure, and the life wheezed out of him speedily as he lay there quivering in the gloom and mire of that rain-swept woodland road. Seldom, even when successfully ambushed, has any small detachment of troops been destroyed so quickly and thoroughly. This killing was almost an artistic triumph.

'Fall in!' growled Bates. 'Any casualties?'

'If there is, the blighters oughter be court-mawshalled,' chirped Smith.

A momentary shuffling of grotesque forms, and a deep voice boomed, 'Half-time score—England twenty, Germany *nil*.'

'Left section—look 'em over, and carry any wounded men likely to live into the barn,' said the corporal. 'Give 'em first aid an' water-bottles. Step lively, too! Right section—hold the horses.'

This leader and his men were as skilled in the business of slaying an enemy as Robin Hood and his band of poachers in the taking of the king's venison. Dalroy knew they needed no guidance from him. He opened the door of the car.

'Irene!' he said.

She was sitting there, a forlorn figure huddled up in a corner. The windows were closed. Each sheet of glass was so blurred by the swirling rain that she could not possibly make out the actual cause of the external hubbub. After the hard schooling of the past month she realised, of course, that a rescue was being attempted. Naturally, too, she put it down to the escape of Maertz. Although her heart was thrumming wildly, her soul on fire with a hope almost dangerous in its frenzy, she resolved not to stir from her prison until the one man she longed to see again in this world came to free her.

Yet when she heard his voice the tension snapped so suddenly that there was peril in the other extreme. She sat so still that Dalroy said a second time, with a curious sharpness of tone, 'Irene!'

'Yes, dear,' she contrived to murmur hoarsely.

'It's all over. A squad of British soldiers

dropped from the skies. Every German is laid out, Von Halwig with the rest.'

'Von Halwig! Is he dead?'

'Yes.'

'I am glad. Arthur, they have not wounded you?'

'Not a scratch.'

'And Maertz?'

'We must see to him. Will you come out? Never mind the rain.'

'The rain! Ah, dear God, that I should feel the blessed rain beating on my face once more in liberty!'

She gave him her hand, and they stood for a moment, peering deep into each other's eyes.

'Arthur,' she said, so quietly now that the storm seemed to have passed from her spirit, 'you have work to do. I shall not keep you. Tell me where to wait, and there you shall find me. But, before you go, promise me one thing. If we fall again into the hands of the Germans, shoot me before I become their prisoner.'

'No need to talk of that,' he soothed her.

'We have a splendid escort. In two hours'—

She caught him by both shoulders.

'You *must* promise,' she cried vehemently.

He was startled by the vibrant passion in her voice. He began then to understand the real horrors of Irene's vigil, whether in the rat-infested darkness of the barn or the cushioned luxury of the limousine.

'Yes,' he muttered savagely, 'I promise.'

Taking her by the arm, he led her to the front of the car, where, clearly visible herself, she would see little, if aught, of the shambles in rear.

Corporal Bates hurried up.

'Her ladyship all right, sir?' he inquired briskly.

'Yes,' replied Dalroy, conscious of a slight tremulousness in the arm he was holding.

Corporal Bates, though in all probability he had never even heard of Bacon's somewhat trite aphorism, was essentially an 'exact' man. He never erred as to distinctions of rank or title. His salute was the pride of the Buffs. Blithely regardless of the fact that not more than five minutes earlier Captain Dalroy had confessed himself ignorant of Lady Irene Beresford's actual social status, he alluded to her 'correctly.'

'I think, sir,' he rattled on, 'that we ought to be moving. It's quite dark now, an' we have our route marked out.'

'How?'

'We've been directed by a priest, sir. The Belgian priests have done us a treat. In every village they showed us the safest roads. Even when they couldn't make us understand their lingo, they could always pencil a map.'

'I see. Do you follow the road to Oosterzeele?'

'For about a mile, sir. Then we branch off

into a lane leading west to the river Schelde, which we cross by a ferry. Once past that ferry, an' there's no more Germans.'

'Very well. Have you searched the enemy for papers?'

'Yes, sir. We're stuffed with note-books an' other little souvenirs.'

'Do your men ride?'

'Some of 'em, sir; but they'll foot it, if you don't mind. They hate killing horses, so we turn 'em loose generally. This lot should be tied up.'

'What of the car?'

'Smithy will attend to that with a bomb, sir.'

Bates evidently knew his business—so evidently that Dalroy did not even question him as to the true inwardness of Smithy's attentions.

The squad cleared up their tasks with an extraordinary celerity. Smithy crawled under the automobile with the flashlight, remained there exactly thirty seconds, and reappeared.

The corporal saluted.

'We're ready now, sir,' he said. 'Perhaps her ladyship will march with you behind the centre file?'

'Do you head the column?'

'Yes, sir.'

'Then, for a little way, we'll accompany you. There were three in our party, corporal. One, a Belgian named Jan Maertz, risked death to get away and bring help. I'm afraid he has been captured on the Oosterzeele road by two hussars detailed for the job. So, you see, I must try to save him.'

(Continued on page 292.)

THE ISLE OF REST.

I KNOW an isle in the far South Seas
Where peace and plenty reign,
And the soft trade-wind in the tall palm-trees
Keeps calling me back again.

I listen, and long with an aching heart
To return to that far tropic shore,
Where the Western cares of house and mart
Are a memory—nothing more.

In dreams again I take my way
Beside the blue lagoon,
Where elves and fairies hold their sway
'Neath the wondrous tropic moon;

And on the encircling coral strand
Of that Pearl of the Southern Sea,
The booming surf sounds loud and grand,
And flings out a welcome to me.

The nut-brown kindly folk of the isle
Shout across the dividing seas,
'Come back to us, return for a while,
Breathe the hibiscus-scented breeze.'

So, back again to that island fair
I shall go when my ship comes in,
Away from this Western land of care,
With its ceaseless turmoil and din.

Chambers's Journal

SEVENTH SERIES

GOWN AND TOWN.

By T. F. PLOWMAN.

THE memory of an ancient feud does not readily die, especially when particular pains are taken to keep it alive; and the university city of Oxford furnished within my own day a notable instance of this. Visitors who have happened to be staying within its precincts on the night of the 5th of November have oftentimes marvelled why the classic 'High' should be the scene of a battle of fisticuffs between two contending factions, and why the air should be rent with cries of 'Town! Town!' from one section of combatants, and 'Gown! Gown!' from the other. Thereby hangs a tale which seems worth the telling, if only to show how enduring can be the influence in this country of something that happened in a remote past; for the nocturnal ebullition in question was the outward and visible sign of a feud some centuries old.

My particular qualification for playing the part of narrator lies in the fact that, having been born and bred in Oxford, and within close earshot of Great Tom, I witnessed many a Gown and Town row; whilst, as I held office under university and city in turn, I had an opportunity of regarding the situation from both points of view. Joined to this, I had an insatiable curiosity to learn the why and the wherefore of the antagonism which then existed between university and city in other quarters as well as the streets, and I took toll of ancient lore to this end.

It is true that the present-day observance of the ancient custom is but a faint echo of what it was in my young days, which date back to the time when the most famous of Oxford novels—a very classic in its way—*Verdant Green*, first saw the light. Those who have read it will remember the notable chapter in which the hero 'discovers the difference between Gown and Town.' It embodies a wonderfully graphic, and withal accurate, account of the November battle as it was fought in those days.

In my childhood I resided in a house overlooking that central space in the very heart of the city known as Carfax, from the French *Quatre voies*, where the four main thoroughfares meet. This was always one of the battle-grounds most favoured, because it permitted the belligerents from the various points of

the compass to meet at a common centre, and allowed plenty of room for operations, with ample facilities for either advance or retreat. As a child I have enjoyed a fearful pleasure by stealing out of bed in the darkness to watch, with bated breath, the fortune of war, and to listen with a fearsome awe to the war-cries disturbing the night's tranquillity. To me it was then all so terribly real that this clash of arms, or, rather, fists, assumed in my young mind almost the proportions of a Waterloo, whilst my heart went out to every poor gownsmen I saw floored, as though he were the hero of my dreams. All my sympathies were with the 'Gown,' not only because they had, to me, a more attractive personality, but also because I always pictured them as inferior numerically and in physical strength to their opponents; for, as a child, I had ever a sentimental leaning toward the weaker side. Moreover, it was impossible for me, in such imaginative days, to afford any support to a cause whose representatives were essentially 'fleshy men' of the bargee type, big and burly, with brawny arms, unkempt locks, and unshaven cheeks, hailing from the inmost recesses of St Thomas—a very Alsatia in those days. They did not at all correspond to the Bayards and knight-errants of my childish imagination, being merely the embodiment of brute force pure and simple. When, however, later on, as a youth, I ventured into the streets, and saw, at a respectful distance, the battle ebb and flow at various points, I found the two sides much more equally matched than I had previously imagined, for the strategy and science of the one went far to counterbalance the superior muscle-development and sledge-hammer tactics of the other. In 1859 Charles Dickens, in happy unconsciousness of the 5th of November lawlessness, had arranged to give a reading in the Oxford Town Hall; but after it was advertised his friends explained to him that he could not expect an audience on such a night, as the quietly disposed people would be afraid to stir out, and those who were differently constituted would want to be enjoying themselves in the streets. So the reading was postponed to a date when there was as much peace and calm as could be reasonably expected in a university city.

I very well remember how, on one occasion, the mayor was so perturbed when he heard that the battle in 'the High' and 'the Corn' was being waged with unusual fierceness that he sallied forth himself, in order to interpose the full weight of his authority in the cause of law and order. Alas for the frailty of human wishes and human nature! Within ten minutes he returned to the Municipal Buildings with ample proof that he had mingled in the fray, in the shape of an eye unmistakably in mourning. An undergrad, recognising in his worship merely one of his hereditary foes, went for him at once, and succeeded in planting his fist where it would be most effective.

The antagonism between Town and Gown, who, mutually interdependent as they were, might have been expected to dwell together in peace and amity, was of no recent origin; and, in the many years during which they have had to put up with each other's close companionship, their mutual relations have generally, and until comparatively recent times, been, to say the least, strained. In my day, the desire of each of the two bodies in question to score off the other was not confined to those who joined issue in the streets on 5th November. Those of more exalted station—to wit, members of Convocation on the one hand, and of the Town Council on the other—manfully maintained the old tradition; and, carried away by a stream of ancient prejudices and conflicting interests, they fought each other in Parliament and the law courts, while those of lesser rank pummelled each other in the streets.

The beginning of it all was on 10th February 1354; and the remembrance of this, carried on from generation to generation, ranking in the breasts of both sides, did more than anything else to ensure a prolongation of old antagonisms. On the day in question a certain cleric, accompanied by some collegiate friends, called for a drink at a tavern which, in those days, occupied a site just opposite the very house from whose windows I used to watch the Gown and Town fray. The liquor was evidently not to the taste of the reverend gentleman and his companions, for they hurled not only some strong epithets, but also a tankard, at the head of the vintner. The latter, assisted by some friends, retaliated. Others on both sides joined in, and forthwith ensued the biggest Gown and Town row that the Oxonians have ever participated in. As the fray became general, the bell of St Martin's, the city church, called the citizens to arms; and a similar summons to the students rang out from St Mary's, the university church. The tavern has long since disappeared, but the bell-tower of St Martin's still rears its head skyward. The mayor himself led the citizens, and the fighting lasted on and off for three days. It would no doubt have gone on longer had not the king,

who was at Woodstock, about eight miles off, been informed of what was happening, and taken measures to stop it, but not before forty students and twenty-three townsmen had succumbed to their wounds.

Then came the inevitable day of reckoning, and pretty dearly the city had to pay for its share in these transactions. In the first place, the university obtained as a *solatium* a very liberal charter, mainly at the expense of the city. This not only gave it some important privileges in connection with the internal government of the city, but it transferred others—including the custody of the assize of bread, wine, and ale, and the supervising of weights and measures—from the city to the university. The last-named privileges it retains, with the accompanying fees, at the present time. It was further enacted that, for all time, the mayor, bailiffs, and aldermen should annually provide a requiem mass at the university church, and should, in company with a certain number of citizens, attend it. Each of the civic party on these occasions was, then and there, to pay one penny to the university proctors for distribution among the poorer scholars. The mayor had at first to come with a hempen rope round his neck; but a silken cord was afterwards substituted for this, and ultimately this piece of humiliation was dispensed with altogether. In Elizabeth's reign prayers and a sermon took the place of the mass.

From time to time the city made, through Parliament and in other ways, divers ineffectual attempts to relieve itself of this church-going, being brought up to the mark when it showed refractory symptoms by threatened enforcements of pains and penalties. At last, in 1825, the university waived the attendance at church, with the understanding that, in lieu thereof, the mayor and sheriff upon election should wait upon the Vice-Chancellor at his residence, and take an oath to observe the rights and privileges of the university. As a child, I used on the afternoon of the mayor-making to watch the starting forth from the Town Hall, which was next door but one to the house wherein I then lived, of a little procession consisting of the mayor, the sheriff, sundry aldermen, and the mace-bearers, all in cocked-hats and gowns, on their way to perform their share of the ancient obligation.

Although the observance was thereby reduced to narrow dimensions, yet the city, as represented by its Town Council, began, in my own time, to protest against it. In 1855 a party of somewhat levelling and anti-university tendencies was in the ascendancy in the Town Council, and in the following year elected a gentleman as mayor who was a very perfect embodiment of their views. He held all forms and ceremonies in abhorrence. He spurned the official cocked-hat and gown; he had the maces put out of sight; he discontinued the corporation attendances at church; he declined to

present an address from the city to the queen, or to pay his respects to her Majesty's judges; and, to crown all, he flatly refused to take the oath to the Vice-Chancellor. His council backed him up in his defiance of the university, and the university replied to the challenge by taking legal proceedings to enforce its rights. This resulted in the issue of a mandamus by the Court of Queen's Bench to compel the mayor to take the oath. Whereupon the university authorities, having once more vanquished their hereditary foe, felt that they could afford to be magnanimous. So they held out the olive-branch by offering, if the mayor would, in token of submission, take the oath once more, to abstain from any opposition to the passing of an Act of Parliament abolishing the ceremony. Hence, in 1857, the little procession set forth for the last time, and thus nineteenth-century citizens were brought face to face with the effects of a Gown and Town row five centuries old. Who would have thought that taking exception to the quality of some liquor would have resulted in centuries of official squabbling?

The iconoclastic mayor, like all the other actors in the little serio-comic drama, has passed away. He held to his principles from beginning to end. He always declared that he would never take the oath, and he never did, for by the time a legal decision was obtained his term of office had expired, and so the swearing had to be done by his successor. He was a mayor of the type not uncommon at that time. It owed its existence to the upheaval resulting from the Municipal Reform Bill; but, strange to say, the advance of democracy has been unfavourable to its perpetuation, for it is rare nowadays to hear of a chief magistrate, however extreme his opinions, who despises the state and panoply of office. When the official term of this particular mayor expired, the régime he had sought to establish came to an end too. The maces soon saw the light of day again, and cocked-hats and gowns and municipal church-going were as much in vogue as ever. The *vox populi* acclaimed him for a time as the champion of liberty to go as you please; but I lived to see in after years the same populace set to work to smash his windows. He was a corn and flour merchant, and there was an impression among *hoi polloi* that he was helping to keep up the price of bread. There was no real foundation for this supposition; but the very suspicion sufficed to obliterate all remembrance of his virtues as a leveller, and to transform in the popular mind the sturdy opponent of the classes into the hated oppressor of the masses.

A fruitful cause of friction between Gown and Town, as represented by the superior powers, was the nervous dread of the former of anything which might possibly endanger the maintenance of discipline; and, to guard against this, the university authorities in the past were desirous

of keeping Oxford as far as possible from contact with the wicked world outside. The city was not particularly keen upon the subject of discipline, but was very much alive to the desirability of promoting anything that tended to stimulate trade. Here were two distinct interests very liable to clash, and they often did. For instance, when railways were first introduced, the city was strongly in favour of Oxford directly participating in the advantages accruing from such means of communication. The university, on the other hand, was alarmed at such a proposition, and petitioned Parliament and used all its influence against it. The objections to the railway touching Oxford sound so comic nowadays that they are worth quoting. The university in its petition to Parliament gave the following reasons why Oxford should not have a railway: Firstly, because the existing means of communication were fully adequate. (This was equivalent to saying that a stage-coach ought to be good enough for anybody.) Secondly, because greater facilities for communication would be injurious to the discipline of the university. Thirdly, because the works adjoining the river would cause floods by impeding the watercourse.

The university succeeded in temporarily staving off the dreaded innovation, for the line had for some time to stop short several miles from Oxford. But even the university could not permanently isolate Oxford, although by compelling the Great Western to make its junction at Didcot, instead of, as was intended, at Oxford, it has left, by the inconvenience it entails, enduring evidence of its past influence. Again, when in 1864 the Great Western Railway Company considered the desirability of establishing carriage and locomotive works in the outskirts of Oxford, the proposal was warmly approved by the city, and as strongly objected to by the university. Each side bombarded the other in the press and at public meetings, and each denounced what it was pleased to call the selfishness of the other. It has been said that most men are in favour of free trade so long as their own goods are protected. There was an illustration of this during this verbal conflict. When there was no prospect of any material addition to the working-class population of the city, nothing could exceed the admiration of certain resident professors of advanced opinions for the man who earned his bread by the sweat of his brow. He was held up to the admiration of public meetings as the possessor of virtues which those in a different sphere sadly lacked. But when it was proposed that this superior being should take up his abode in their midst, it was somewhat surprising to find that these very professors were the fiercest denouncers of such a proceeding, on the ground of the demoralising effect it would have upon the university. Pictorial satire was brought into play by both sides; and Mr Sydney Hall, the *Graphic* illustrator, who was then an Oxford

undergraduate, made a contribution to the discussion in the shape of a clever cartoon. It represented the then Vice-Chancellor (Dr Lightfoot) as Jupiter hurling Vulcan, typifying the working-man, out of heaven, otherwise the precincts of the university.

It need hardly be said that the Great Western artisans never got within sight of Oxford; and, as the university was credited by the city with keeping them away, it did not tend to an increase of cordiality between the two bodies.

Another battle royal came off in 1875, when Mr Cardwell's Bill creating Oxford, among other places, a military centre was introduced into Parliament. Every effort was made by the university to defeat, and by the city to support, the clause affecting Oxford. Once more was the old cry raised that discipline could not be maintained if Tommy Atkins came upon the scene, and that nothing less than demoralisation would follow in his wake. The question was hotly debated, and its discussion in the House of Commons was noteworthy, inasmuch as, in the course of it, the late Lord Randolph Churchill made his maiden parliamentary speech. His lordship took up the cudgels on behalf of the university, and pictured in forcible language the terrible result which would arise from the presence, as he put it, 'of a roistering soldiery' in its midst. But the clause was adopted, and in due course the soldiers were quartered about two miles outside the city. It is satisfactory to record that none of the dire forebodings referred to have been realised, for no one appears to have been contaminated, nor has discipline suffered. The military element has come to be regarded as a pleasant addition to Oxford society, and no one is anxious to banish it elsewhere.

Differences, as has been shown, have often led to Gown being ranged against Town in opposing camps, but happily the days of distrust and antagonism have to a great extent passed away, never, it is to be hoped, to return. With the license of metaphor, it can be said that the

hatchet is buried, and university and city smoke the calumet of peace round one camp-fire. In other words, they meet in friendly conference round the same table, as made and provided by the Local Government Act of 1888. The Town Council is now composed of representatives elected by both university and city, a proportionate number of aldermen being allotted to each. The change which this implies can only be adequately appreciated by those who have had a personal acquaintance with the old order of things.

For centuries the corporation, at the stern bidding of their hereditary foe, went, in the disposition of Shakespeare's schoolboy, 'creeping like snail unwillingly' to the university church, and fought hard to be relieved from this attendance. But when the city church was in recent years in the hands of the cleaners, the university, in a spirit of grace instead of compulsion, invited the mayor, aldermen, and councillors to make use of the university church; and the invitation being gracefully accepted, the members of the corporation, for the first time for more than five centuries, went to St Mary's of their own free-will and accord, and with no trace of rancour in their hearts.

Each party has found the other much pleasanter at close quarters than at a distance, and the result has been that the principle of give and take, which contains the germ of so many peaceful solutions, has obtained a recognition from both sides to which it was previously a stranger. With all due deference to the copy-books, familiarity has not, in this case at least, bred contempt, but quite the reverse. To crown all, *mirabile dictu*, in 1913-14, and again last year, a full-fledged university man, by unanimous consent, occupied the mayoral chair.

So, Gown and Town having made up their old differences and settled down to a quiet humdrum life of domestic felicity, it seems perfectly safe to forestall the future by saying, 'And they lived happy ever after,' as no doubt, if only in deference to popular sentiment, they will.

THE DAY OF WRATH.

CHAPTER XIV.—THE MARNE—AND AFTER.

'THAT'S awkward, sir,' said the corporal, as the detachment moved off into the night, leaving the motor-car's acetylene lamps still blazing merrily.

'Why "awkward"?' demanded Dalroy.

'Because, when we fellows met in a wood near "Monz," we agreed that we'd stick together, and fight to a finish; but if any man strayed by accident, or got hit so badly that he couldn't march, he took his chances, and the rest went on.'

'Quite right. How does that affect the present situation?'

'Well, sir,' said Bates, after a pause, 'there's you an' the lady. Our chaps are interested, if I may say it. You ought to have heard their langwidge, even in whispers, when that—well, I can't call him anything much worse than what he was, a German officer—when he was telling you off, sir.'

'What did the German officer say, sergeant?' put in Irene innocently.

'Corporal, your ladyship. Corporal Bates, of the 2nd Buffs.'

'I'm sorry to have to interrupt,' said Dalroy. 'You must give Lady Irene a full account some

other time. If you are planning to cross the Schelde to-night, there is a long march before you. We part company at the lane you spoke of. I leave her ladyship in the care of you and your men with the greatest confidence. I make for Oosterzele. If Jan Maertz is a prisoner, I must do what lies in my power to rescue him. If I fail, I'll follow on and report at Gand in the morning.'

For a little while none spoke. The other men marched in silence, a safeguard which they had made a rigid rule while piercing their way by night through an unknown country held by an enemy who would not have given quarter to any British soldier.

Bates was really a very sharp fellow. He had the sense to know that he had said enough already. Dalroy's use of Irene's title conveyed a hint of complications rather beyond the ken of one whose acquaintance with the facts was limited to an overheard conversation between strangers. Moreover, soldier that he was, the corporal realised that one of his own officers was not only deliberately risking his life in order to save that of a Belgian peasant, but felt in honour bound to do no less.

So Irene was left to tread the narrow path unaided. To her lasting credit, she neither flinched nor faltered.

'We may find it difficult to reach Gand, so I'll wait for you in Ostend, Arthur,' she said composedly.

Now, these two young people had just been snatched from death, or worse, in a manner which, a few weeks earlier, the least critical reader of romantic fiction would have denounced as so wildly improbable that imagination boggled at it. Irene, too, had unmistakably told the man who had never uttered a word of the love that was consuming him that neither rank nor wealth could interpose any barrier between them. It was hard, almost unbearable, that they should be parted in the very hour when freedom might truly come with the dawn.

Dalroy trudged a good twenty paces before he dared trust his voice. Even then he blurted out, not the measured agreement which his brain dictated, but a prayer from his very heart. 'May God bless and guard you, dear!' was what he said, and Irene's response was choked by a pitiful little sob.

Suddenly Dalroy, whose hearing was quickened by the training of Indian *shikar*, touched the corporal's arm, and stood fast. Bates gave a peculiar click in his throat, and the squad halted, each man's feet remaining in whatever position they happened to be at the moment.

'Horses coming this way,' breathed Dalroy.

'Right, sir. This'll be your two, with Jan Wot's-his-name, I hope. Leave them to us, sir.—Smithy, Macdonald, and Shiner—forward!'

Three shapes materialised close to the trio in front. The rain was still pelting down, and

the trees nearly met overhead, so the road was discernible only by a strip of skyline, itself merely a less dense blackness.

'Them two Yewlans,' explained the corporal, 'probably bringing a prisoner. Mind you don't hurt him.'

No more explicit instructions were given or needed. Of such material was the British Expeditionary Force.

'Take her ladyship back a few yards, sir,' gurgled Bates. 'The horses may bolt. If they do, we must stop 'em before they gallop over us.'

Every other consideration was banished instantly by the thrill of approaching combat. By this time Dalroy was steeped in admiration for his escort's methods, and he awaited developments now with keen professional curiosity. And this is what he saw, after a breathless interval. A flash in the gloom, and the vague silhouettes of two hussars on horseback. One horse reared; the other swerved. One man never spoke. The other rapped out an oath which merged into a frantic squeal. By an odd trick of memory, Dalroy recalled old Joos's description of the death of Busch: 'He squealed like a pig.'

Then came a cockney voice, 'Cheer-o, mitey! We're friends, amnies! Damn it all, you ain't tikin' us for Bosches, are yer?'

'Hola! Jan Maertz!' shouted Dalroy.

'Monsieur!'

Irene laughed—yes, laughed, though two men had died before her eyes!—at the amazement conveyed by the Walloon's gruff yelp.

'Don't be alarmed! These are friends—British soldiers,' went on Dalroy.

'I thought they were devils from hell,' was the candid answer.

Jan was unquestionably frightened. For one thing, his hands were tied behind his back, and he was being led by a halter fashioned out of a heel-rope, a plight in which the Chevalier Bayard himself might have quaked. For another, he had been plodding along at the side of one of the horses, thinking bitterly of the fair Léontine, whose buxom waist he would never squeeze again, when a beam of dazzling light revealed a crouching, nondescript being which flung itself upward in a panther-like spring, and buried a bayonet to the socket in the body of the nearest trooper. No wonder Jan was scared.

The soldiers had caught both horses. Dalroy, a cavalryman, had abandoned the earlier remounts with a twinge of regret. He thought now there was no reason why he and Irene should not ride, as the day's tramp, not to speak of the strain of the past hour, might prove a drawback before morning.

'Can you sit a horse astride?' he asked her.

'I prefer it,' she said promptly.

Bates offered no objection, so long as they followed in rear. The hussar's cloaks came in useful, and Dalroy buckled on a sword-belt.

Jan announced that he was good for another twenty miles provided he could win clear of those *sales Alboches*. He was eager to relate his adventures, but Dalroy quieted him by the downright statement that if his tongue wagged he might soon be either a prisoner again or dead.

A night so rife with hazard could hardly close tamely. The rain cleared off, and the stars came out ere they reached the ferry on the Schelde, and a scout sent ahead came back with the disquieting news that a strong cavalry picket, evidently on the alert, held the right bank. But the thirteen had made a specialty of disposing of German pickets in the dark. In those early days of the war, and particularly in Flanders, Teuton nerves were notoriously jumpy, so the little band crept forward resolutely, dodging from tree to tree, and into and out of ditches, until they could see the stars reflected in the river. Dalroy and Irene had dismounted at the first tidings of the enemy, turning a pair of contented horses into a meadow. They and Maertz, of course, had to keep well behind the main body.

The troopers, veritable Uhlans this time, had posted neither sentry nor vedette in the lane. Behind them, they thought, lay Germany. In front, across the river, the small army of Belgium held the last strip of Belgian territory, which then ran in an irregular line from Antwerp through Gand to Nieupoort. So the picket watched the black smudge of the opposite bank, and talked of the Kron-Prinz's stalwarts hacking their way into Paris, and never dreamed of being assailed from the rear, until a number of sturdy demons pounced on them, and did some pretty bayonet-work.

Fight there was none. Those Uhlans able to run ran for their lives. One fellow, who happened to be mounted, clapped spurs to his charger, and would have got away had not Dalroy delivered a most satisfactory lunge with the hussar sabre.

No sooner had Bates collected and counted sixteen people than the tactics were changed. Five rounds rapid rattled up the road and along the banks.

'I find that a bit of noise always helps after we get the wind up with the bayonet, sir,' he explained to Dalroy. 'If any of 'em think of stopping, they move on again when they hear a hefty row.'

A Belgian picket, guarding the ferry and, what was of vast importance to the fugitives, the ferry-boat, wondered, no doubt, what was causing such a commotion among the enemy. Luckily the officer in charge recognised a new ring in the rifles. He could not identify it, but was certain it came from neither a Belgian nor a German weapon.

Thus, in a sense, he was prepared for Jan Maertz's hail, and was even more reassured by Irene's clear voice urging him to send the boat.

Two volunteers manned the oars. In a couple of minutes the unwieldy craft bumped into a pontoon, and was soon crowded with passengers. Never was sweeter music in the ears of a little company of Britons than the placid lap of the current, followed by the sharp challenge of a sentry: '*Qui va là ?*'

'A party of English soldiers, a Belgian, and an English lady,' answered Dalroy.

An officer hurried forward. He dared not use a light, and, in the semi-obscurity of the river-bank, found himself confronted by a sinister-looking crew. He was cautious, and exceedingly sceptical when told briefly the exact truth. His demand that all arms and ammunition should be surrendered before he would agree to send them under escort to the village of Aspen was met by a blank refusal from Bates and his myrmidons. Dalroy toned down this cartel into a graceful plea that thirteen soldiers, belonging to eight different regiments of the British army, ought not to be disarmed by their gallant Belgian allies, after having fought all the way from Mons to the Schelde.

Irene joined in, but Jan Maertz's rugged speech probably carried greater conviction. After a prolonged argument, which the infuriated Germans might easily have interrupted by close-range volleys, the difficulty was adjusted by the unfixing of bayonets and the slinging of rifles. A strong guard took them to Aspen, where they arrived about eleven o'clock. They were marshalled in the kitchen of a comfortable inn, and interviewed by a colonel and a major.

Oddly enough, Corporal Bates was the first to gain credence by producing his map and describing the villages he and his mates had passed through, the woods in which they had hid for days together, and the curés who had helped them. Bates's story was an epic in itself. His men crowded around, and grinned approvingly when he rounded off each curt account of a 'scrap' by saying, 'Then the Yewlans did a bunk, an' we pushed on.'

Dalroy, acting as interpreter, happened to glance at the circle of cheerful faces during a burst of merriment aroused by a reference to Smithy's ingenuity in stealing a box of hand-grenades from an ammunition wagon, and destroying a General's motor-car by fixing an infernal machine in the gear-box. The mere cranking-up of the engine, it appeared, exploded the detonator.

'Is that what you were doing under the car outside the barn?' he inquired, catching Smithy's eye.

'Yus, sir. I've on'y one left aht o' six,' said Smithy, producing an ominous-looking object from a pocket.

'Is the detonator in position?'

'Yus, sir.'

'Will you kindly take it out and lay it gently on the table?'

Smithy obeyed, with reassuring deftness.

Dalroy was about to comment on the phenomenal risk of carrying such a destructive bomb so carelessly, when he happened to notice the roll collar of a khaki tunic beneath Smithy's blue linen blouse.

'Have you still retained part of your uniform?' he inquired.

'Oh, yus, sir. We all 'ave. We weren't goin' to strip fer fear of any bally Germans—beg pawdon, miss—an' if it kime to a reel show-dahn we meant ter see it through in reggelation kit.'

Every man of twelve had retained his tunic, trousers, and puttees, which were completely covered by the loose-fitting garments supplied by the priest of a hamlet near Louvignies, who concealed them in a loft during four days until the mass of German troops had surged over the French frontier. The thirteenth, a Highlander, actually wore his kilt!

The Belgian officers grew enthusiastic. They insisted on providing a *vin d'honneur*, which Irene escaped by pleading utter fatigue, and retiring to rest.

Dalroy opened his eyes next morning on a bright and sunlit world. It might reasonably be expected that his thoughts would dwell on the astounding incidents of the past month. They did nothing of the sort. He tumbled out of a comfortable bed, interviewed the proprietor of the 'Trois Couronnes,' and asked that worthy man if he understood the significance of a Bank of England five-pound note. During his many and varied 'scapes, Dalroy's store of money, carried in an inner pocket of his waistcoat, had never been touched. Monsieur le Patron knew all that was necessary about five-pound notes. Very quickly a serviceable cloth suit, a pair of boots, some clean linen, a tin bath, and a razor were staged in the bedroom, while the proprietor's wife was instructed to attend to mademoiselle's requirements.

Dalroy was shaving, for the first time in thirty-three days, when voices reached him through the open window. He listened.

Smithy had cornered Shiney Black in the hotel yard, and, in his own phrase, was 'puttin' 'im through the 'oop.'

'You don't know it, Shiney, but you're reely a verdamd Henglishman,' he said, with an accurate reproduction of Von Halwig's manner, if not his accent. 'The grite German nytion is abart ter roll yer in the mud, an' wipe its big feet on yer tummy. You've arsked fer it long enough, an' nah yer goin' ter git it in the neck. Blood an' sausage! The cheek o' a silly little josser like you tellin' the Lord-'Igh-Cock-a-doodle-doo that 'e can't boss everybody as 'e dam well likes! Shiney, you're done in! The Keyser sez so, an' 'e ought ter know. W'y? That shows yer miserable hignorance! The Keyser sez so, I tell yer, so none o' yer lip, or I, Von Schmit, o' the Dirty

'Alf-Hundredth, will biff you on the boko. But no! I must keep me 'air on. As you an' hevery hother verdamd Henglishman will be snuffed aht before closin'-time, I shall grashiously tell thee wot's wot an' 'oo's 'oo. Germany, the friend o' peace—no, you blighter, not Chawlie Peace, the burglar, but the lydy in a nightie, wiv a dove in one 'and an' a holive-branch in the other—Germany will wide knee-deep in Belgian an' French ber-lud so as to 'and you the double Nelson. By land an' sea an' pawcels post she'll rine fire an' brimstone on yer pore thick 'ead. What 'ave you done, you'd like ter know? Wot 'aven't you done? Aren't you alive? Wot crime can ekal that when the Keyser said, "Puff! aht—tallow-candle"? Ach, pig-dorg, I shpit on yer!'

'You go an' wash yer fice once more, Smithy,' said Shiney, forcing a word in edgeways. 'It'll improve yer looks, per'aps. I dunno.'

'That's done it,' yelped Smithy, warming to his theme. 'That's just yer narsty, scoffin' British w'y o' speakin' to quiet, respectable Germans. That's wot gets us mad. I'm surprised at yer, Shiney! Yer hattitude brings tears to me heyes. Time an' agine you've 'eard ahr bee-utiful langwidge'—

'I 'ave, indeed,' interrupted Shiney. 'But none o' it 'ere, me lad. There's a reel born lydy in one o' them bedrooms.'

'I'm not torkin' o' the kind o' tosh you understand,' retorted Smithy. 'I'm alludin' to the sweet-sahndin' langwidge o' our conquerors. You've 'eard it hoften enuf from the soft mowves o' Yewlans. On'y larst night you 'eard it spoke by that stawr hactor, Von 'Allwig, of the Potsdam Busters. Yet you can git nothink orf yer chest but a low-dahn cockney wheeze w'en a benefactor's givin' yer the strite tip. Pore Shiney! Ye think yer goin' back to Hengland, 'ome, an' beauty—to the barrick-square, bully-beef an' booze, an' plenty o' it. Dontcher believe it! Wot you're in fer is a dose o' German *Kultur*. W'en yer ship's been torpedoed fourteen times between Hostend an' Dover, w'en yer Sarth-Eastern trine 'as bumped inter a biker's dozen o' different sorts o' mines, w'en you're Zepped the minnit you croree the Strend to the nearest pub, you'll begin ter twig wot the Hemperor of All the 'Uns is ackshally a-doin' of. It's hall hup wiv yer, Shiney! You've ether got ter lie dahn an' doi, er learn German. Nah, w'ich is it ter be! Go west wiv yer benighted country, or go nap on the Keyser!'

'Torking o' pubs reminds me,' yawned Shiney. 'I couldn't get any forrarder on that ginger-pop the Belgian horficers gev us. In one o' them Yewlans' pawket-books there was five French quid. Wot abart a bottle o' beer?'

'Wot abart it?' agreed Smithy instantly.

The soap was drying on Dalroy's face, but he thrust his head out of the window to look at two of Britain's first line swaggering through the

gateway of the inn, and whistling, 'It's a long, long way to Tipperary.' Smith and Shiney were true types of the somewhat cynical but ever ready-witted and laughter-loving Londoner, who makes such a first-rate fighting-man. They were just a couple of ordinary 'Tommies.' The deadly fury of Mons, the daily and nightly peril of the march through a land stricken by a brutal enemy, the score of little battles which they had conducted with an amazing skill and hardihood—these phases of immortality troubled them not

at all. An eye-rolling and sabre-rattling emperor might rock the social foundations of half the world, his braggart henchmen destroy that which they could never rebuild, his frantic gang of poets and professors indite Hymns of Hate and blasphemous catch-words like 'Gott strafe England!' but the Smithies and Shiniies of the British army would never fail to cock a humorous eye at the vapourers, and say sarcastically, 'Well, an' wot abart it?'

(Continued on page 310.)

THE SALT PERIL IN THE NETHERLANDS.

By I. I. BRANTS.

FROM earliest infancy we have been treated to tales both touching and fantastic about Holland, the submarine country. There is the amiable story about the boy who saved his country by plugging with his thumb a hole in one of the dikes—a technical impossibility, of course, in more respects than one. The destruction wrought by this year's winter floods has brought these tales back to our memories even amidst the excitement of a world-wide war.

People naturally take an interest in the district whence comes so large a quantity of their cheese, butter, eggs, beef, and flowers, especially when this source of milk and honey is threatened with extinction, or at least temporary suspension. Moreover, the titanic and secular struggle of man with the elements fascinates the imagination.

Now it is commonly thought and taught that water is the hereditary and mortal enemy of the Dutch, the principal danger to their race. This is a mistake. Though still able to cause passing inconvenience, or at a pinch loss, the liquid element is indeed powerless in the face of modern science. Salt is the chief peril, the paltry NaCl; it is the inveterate foe of agriculture, the stealthy assassin stabbing the Netherlands in their most vital parts—the rich provinces of North Holland, Friesland, and Groningen, where all good things come from.

Roughly speaking, the kingdom of Holland can be divided into two sections—the larger, in the south and east, elevated well beyond the reach of the water, and, indeed, frequently suffering from the want of it; the smaller, in the north and west, subject to floods. It should not, however, be imagined that the whole of the latter is situated below the level of the sea. This is the case with comparatively limited districts. It is sweet-water floods, river spates, inundations, caused by the Rhine and the Meuse, which threaten the bulk of the land, or at least used to threaten it. Modern hydraulic engineering has constructed rows of dikes so solid and massive along the chief arteries and their branches, and has invented a system of

expansion outlets and safety-valves so cleverly organised, that, but for a miracle of untoward coincidence, the danger of the river, fifty years ago still a terrible reality, can now be considered a thing of the past. There remains the sea. No human skill can permanently resist the full fury of its waves. But Nature fortunately wards against her own excesses. The same south-western storms which chase the wild waters landward cause them also to plough up the shallow bottom of the sea, thus mixing the seething surge with light yellow sand, which they carry to the shore, and, retreating, deposit there. These sands the wind drifts into heaps, hillocks, and monticules, a wide row of sand-dunes kept stationary by the vegetation which presently covers them. These sand-dunes are Holland's safest protection. In two brief stretches only are they wanting on the west coast. There man has had to interfere by raising powerful dikes of granite, which must continuously be renewed. This constitutes a yearly burden of millions on the Budget, which clearly proves how impossible it would be financially to replace the sand-dunes by artificial works.

Nor do these dunes exist along the wide estuaries of the Scheldt, Meuse, and Rhine, and their branches, up which the tides come sweeping twice a day. On these inland shores, however, the sea cannot bring its full vigour to bear, and on the whole a system of strong dikes is able to perform its defensive duty well. On the northern coasts also the dunes are absent, but so are the fiercer storms. Moreover, these shores are protected by a long line of little islands, behind which the stilled waters deposit layer upon layer of heavy, sticky, fertile clay, thus slowly adding to the land instead of eating into it. In this constructing work man also comes to the assistance of nature by building dikes round every new addition whenever the sea has raised it sufficiently above low-water mark.

Thus, through the regulating skill of human inventiveness, Holland can at present be said to lie *sevis tranquilla in undis*, as the motto runs,

owing to the perfect equipoise between conflicting elements. The only doubtful point is the famous Zuyder Zee, which has caused the recent havoc. It is a choppy, turbulent sheet of water, startlingly responsive to the winds of heaven because of its comparative shallowness, and because of its peculiar shape, which readily lets in the storm-swept floods of the west without affording an outlet. Nevertheless it would be quite possible also, financially speaking, to ward against this danger even though the wind rose to the excessive and extraordinary violence of the recent hurricane. Nor will it be difficult to free the land of the water which covers it. The permanent damage is done not by the water, but by the salt. And this salt problem, which the January and February floods have accentuated, is one of long standing in the most prosperous part of Holland, the peninsula above Amsterdam and the Y. At the root of the matter is the rivalry between the Amsterdam merchants and the agriculturists of the surrounding country. During the seventeenth and eighteenth centuries the Zuyder Zee was a centre for European commerce. Its inland position made it safe from the attacks of hostile fleets, and its shores were studded with prosperous trading ports. In the nineteenth century, however, the ever-increasing draught of the vessels became too great for the shallows of a basin, the comparatively low salt percentage of which did but enhance the difficulties for heavily freighted craft. This was the origin of the so-called 'dead cities of the Zuyder Zee'—Hoorn, Enkhuizen, Medemblik, and the others, the favourite haunts of artists and tourists of many nations.

It seemed as though Amsterdam, the capital of the new kingdom, must sooner or later share their fate, and yield its commerce to Rotterdam and other ports in open communication with the ocean. This induced King William the First to urge the construction of the North Holland Canal from Amsterdam through the whole length of the northern peninsula. It took from 1819 to 1824 to finish this important work, some sixty miles long, and deep enough for the biggest sea ships of the period. The land through which the new canal passed belonged to the richest polder-land of the country. It should be explained that a Dutch polder is a piece of land below the level of the nearest river or of the normal high tide of the sea, which, originally a morass or lake, has been drained and brought under cultivation. It is intersected by drainage ditches and surrounded by a dike, which in its turn is surrounded by a circular drainage canal. Out of these ditches the superfluous water is pumped into the canal, and thence eventually brought by hydraulic machinery into the sea or an open river, wherewith the entire system of polder canals communicates. To a certain extent there is also communication between the canals and the ditches, the superfluous water of

the polder being due not merely to rainfall, but also to the oozing through of canal water subterraneously and even from the dikes.

Prior to 1820 the system of North Holland was an entirely sweet-water system. There was no open connection with the sea, the locks being only opened for letting out the excess of water during low tide. After the construction of the shipping canal, however, sea ships had to be let in principally during high tide. At the Helder in the north strong salt-water thus flowed in periodically.

At the southern end, at Amsterdam, the Y also stood in open communication with the Zuyder Zee. But under normal, undisturbed conditions the water in the southmost part of this basin contains but 0·5 per cent. of salt, which, moreover, was amply compensated by the flow of sweet-water from the large basin of the Y and the Haarlem Lake, both at that time still in existence. Besides, if need were, water from the Lek and Rhine could easily be let into the North Holland system by simply opening the locks leading into these rivers.

The draught of sea vessels kept increasing during last century. Soon the North Holland Canal proved useless; and the Government, bent on saving the commerce of the capital, took the bold step of cutting a deep-sea canal directly from Amsterdam westward to the North Sea, through fields and marshes and five weary miles of loose sand-dunes of considerable elevation. This North Sea Canal was begun in 1865, and finished in 1876. It contained pure sea-water, with a salt percentage of 3·2. Moreover, it entirely cut off the bulk of the province from sweet-water supply. Since the year 1874, therefore, the 'salting' process of its water system has continued rapidly. All canals and their branches, and all ditches, are becoming increasingly brackish. It has come to be more and more difficult to obtain drinking-water for man and beast. Even washing-water is extremely scarce. It is hard for an outsider to realise that the inhabitants of this waterland are practically dependent for their water-supply on the frequently scanty and always irregular rainfall. In a dry summer drinking-water has to be brought by rail or by boat; it can then be bought at Hoorn railway station at a penny a bucketful, whence it is retailed in more distant villages at fivepence a bucket. Of late years the situation in the larger centres has somewhat improved, as amongst the dunes of the west coast reservoirs have been constructed, whence the water is carried by piping to the polders of the east. But it will not be possible to extend, if even to continue, this system. The excessive and unnatural drainage is beginning to affect the vegetation of the dunes. The trees and shrubs which shield the sand from the storm wind, and the weeds and grasses, the roots of which keep it together, are threatened with extinction. This would

send the hills rolling inland again, and cause them to cover more of the fertile land than has been covered already, the hungry sea eagerly following each step of their retreat. The equipoise of nature needs a delicate handling.

As for the 'salting' process, this seems to have been realised by the present inundation. The salt percentage of the polder water is now 1·5 at least, and in some places as much as 2. Water salted to this extent is useless for the cattle, or even for washing, and is very injurious to agriculture. Experience has taught that, although in comparatively few years, with the aid of rainfall and sweet river-water, virgin soil can be 'unsalted' again, a lengthy process is needed for tilled fields, whilst it is even dangerous to till the land during the process. In the case of the Bath polders in the province of Zeeland, it took ten years to bring the soil back to its original fertility. In North Holland the process will take longer still for lack of river-water.

The only thing which can save the situation

permanently is the draining of the Zuyder Zee in accordance with the projects at present ready. This would cut off the greater part of the Zuyder Zee basin from the salt North Sea, converting it partly into land and partly into a central sweet-water lake fed by the river Ysel, one of the outlets of the Rhine. This Rhine-water could then be used for 'unsalting' North Holland, which, moreover, would be free from the danger of floods, as also all the other provinces would be which surround the Zuyder Zee. The recent calamity has made this project seem so advantageous that it is almost certain to be adopted. Dr Vissering, a financial authority, estimates the cost of building a dike shutting out the North Sea water at some three and a half millions sterling, a sum much less than the cost of the relief at present necessary; and surely the expense of keeping in repair a new dike twenty-five miles in length cannot be compared with that of the present littoral dike of two hundred miles.

GOLD IN WAITING.

CHAPTER II.

WHEN this clause was read out by Fancit's attorney to those assembled in the house after the old fellow's funeral, the gravest of the village fathers could not forbear from smiling. For if there was one woman in that wide shire to whom (as those present, with wry faces, conceded) it would be unwise to apply correction of any sort, it was the dandy, high-coloured, free-spoken, and bold-accounted wench of Farmer Clinkscales. Ebenezer, sitting there in his stiff funeral clothes, looked at the floor between his boots, but said no word. But he was not slow to bring his long courting to a head, and within eight weeks of his father's passing he had brought Alice, a bride, and a bonny one, to the old house in Sparcliff Street.

It would seem that the spiteful testamentary clause had been faithfully repeated to her, for the very first thing Alice did on entering the old house as its mistress was to put the ash stick, without even removing its silver top (for she was not one of your careful bodies), on the parlour fire. Ebenezer gave a great laugh, and even pressed the stick nearer to the coals with his heavy boot. But the ash stick was tough, like its old owner, and the fire did not seem able to do much with it. The flames would lick at it and then leave it, as if it were not much to their taste. Finally, scorched and blackened, it rolled into the grate, and Alice was too busy entertaining her guests to put it back on the fire. So it lay in the grate till Ebenezer, who (despite that sobering clause) had been toasting his inheritance ever since he became his own man, rolled in from the 'Quart Pot' about eleven that

night, with a fine frenzy in his eye, and sought to embrace her, whereupon she picked up the scorched stick and thrashed him to his bed; and the neighbours, hearing her voice raised in shrill upbraiding, and the whacks of the cudgel, shook their heads and said that Ebenezer had made a nice fool of himself by marrying so vicious a hussy.

However that may have been, the cure had apparently begun, for Ebenezer went no more to the 'Quart Pot.' He was too frightened. He went in once, but Alice followed him and clawed him out by the scruff of the neck before he could raise tankard to lips. And he dared go no more. But he could ride into Wayford, and to the 'Brown Cow' at Chipping Spain.

He would have, of course, his better moments, and appear almost contrite when Alice rated him on his worse ones; but the better moments became fewer and the worse ones more numerous as time went on. The bad company he fell in with at Wayford took his money from him at cards and wagering, and it was seldom he came home with much in his purse, if his purse arrived there at all. These harpies knew that Ebenezer Fancit would never keep sober for a week, let alone a calendar year, and they were going to have what he had while he had it. Folk said—and it was true—that he was ten times as bad now as he had been before.

Alice, the rough-handed spitfire, thrashed him to bed with the ash stick a time or two more, and this method of reproof might have become a habit with her had not the jeers of Ebenezer's companions stung him to resistance; so that one

night, after the first blow, he snatched the stick from her, and would have laid it sharply across her shapely form had not a sudden scream stopped him. And old Martha the servant, who had been passed on with the house to Ebenezer (and indeed, with her gnarled face and creaking joints, she appeared an integral portion of it), came hurrying out of the kitchen and whispered something swiftly in his ear.

Rough times and rough people, but they had their sudden gentle moments. When Ebenezer one night was found lying in a ditch, his horse calmly cropping the grass near by, and was brought home by one of Farmer Clinkscapes's own wagoners, Alice uttered quite an ordinary feminine cry of dismay on perceiving the cut in his forehead, and even let her tears fall as she washed it and bound it up. And Ebenezer, coming to, and seeing those tears, uttered a repentant oath—he had a variety of oaths to draw upon to express different emotions—and, pulling her down to him, kissed her, and cried himself. But such moments were of fleeting duration; and within a few days it was again 'boot and saddle,' and the road to Wayford, where the merry thieves awaited him.

The three small men, as in duty bound, and because they must work out the fifty pounds paid in advance for the service, kept a grave eye on Ebenezer, and at length, one Sunday, after taking counsel with each other, called upon the young man in a body to remonstrate with him. But Ebenezer had a sore head after Saturday night's wassailings, and such was his reception of them that Perriker and Maggs were edging towards the door, when Burden, who could not have followed his calling had he not possessed an iron forearm, took the reveller by the lapel of his coat and thrust him back upon the couch in the parlour from which he had sprung.

'Master Fancit,' said he, 'we are but carrying out your father's behest, and we will brook no hard words or fierce looks. You are a disgrace to that father, and to the village which gave you birth; and, as you go now, you will be looked upon with shame by the children who will come to you'—

Whack! And the scorched ash stick fell across the smith's broad shoulders; and there, behind him, stood Alice, her face red as fire.

'Will you not meddle with matters that don't concern other folk, and least of all menfolk?' she shrilled.

'Mistress,' said Burden, laying his great hand on the cudgel as it rose again, 'it is that very matter that concerns us more than the money your man is by way of missing if he does not alter his ways.'

'I say it is like your saucy impudence!' screamed the handsome virago, trying to wrest the stick from him.

'And of this, by all accounts, there has been enough use,' quietly retorted the smith, snapping the ash cane, brittle from its scorching, as if it had been a twig. 'Now, then,' he added, 'let you two, on this day, which is a day when proper folk take peaceful counsel, strive to arrive at a better way of life, for your own sakes, for the sake of the substance in jeopardy, and for the sake of those who may follow you.'

He went out, the others preceding him—they regarded it as the safer plan—and left Ebenezer and his Alice looking at each other.

'Get me a bottle, wife,' growled Ebenezer with a sulky oath, as he flung himself back upon the couch.

'Not I,' she cried. 'The lump of a man was right, and you are drinking up what others will soon need. I wish the dead men underneath would rise and empty every bottle you have stored there. 'Tis Martha or I you always send,' she added tantalisingly, 'for you dare not go down among those old bones yourself.'

'Dare I not?' shouted Ebenezer, thus braved; and he sprang from the couch, paused a moment, with hand uplifted, as if he would punish her, but recoiled from the blaze in her eyes, and rushed on, to fall headlong into the dark cellar.

'Martha,' said Alice to the old servant, grumbling among her pots and pans, 'look after your master, for I will do so no more;' and plucking her bonnet and cloak from their pegs, she turned the handle of the street door and went flying off.

The three small men, who had gone but a few paces, saw her, and little Maggs would have followed her.

'Nay, let her go,' said the smith. 'She has had enough of him. Likely 'twill give him pause.'

And they stood watching her go flashing down the hill to where the Cliff brook crossed it in its dip, and where a frail wooden foot-bridge spanned the brook. Looking neither to the back nor to the side of her, Alice sped on, crossed the bridge, and took the footpath along the brook to Coatmayes Farm, lying snug within its high walls.

For here were sober folk and kind, and her own quiet bedchamber, to which her father had prophesied she would surely return before many months had flown.

Old Fancit had died at midwinter, and by now the virgin spring of the first calendar year had matured into the matron summer; the meadows laughed; the bees worked happily in the sun; but Ebenezer Fancit was no nearer to qualifying for the hard cash of his inheritance.

And Alice, his wife, with her unborn babe, had gone from him.

(Continued on page 314.)

OLIVES.

By F. A. DOUGLAS.

IN November, when this is a land of mists and vapours, of fog, bronchitis, and rheumatism, in Provence they are garnering the olive.

It was the Romans who brought the olive to France. The Greeks crowned Minerva and her disciples, the young laureates, with its silvery foliage; but the Romans, a more practical people, spread its cultivation all round the shores of the Mediterranean, both in Europe and in Africa.

'*Tous les jours sont fêtes in Provence*' is a French proverb, and the olive-harvest, in the 'golden November days' one writer speaks of, is a picturesque sight. In many places the old costumes are still worn, and peasants come from all quarters, just as they do here for the hop-picking, to the olive-farms.

The Provençal olive-tree, subject to systematic pruning, is seldom more than fifteen feet high, and the trees are planted twenty-five feet apart. Rustic double ladders, called *escaraçons*, are placed beside the trees, and the olives are all picked by hand. The men on the ladders clear the upper branches, and the women the lower ones. A man can gather about two pecks a day.

The arrangements for the housing of the olive-pickers from a distance are rather curious. The farmer is bound to supply each picker with space in a loft for a straw bed, and to contribute one sheet to each two people. Supplies of vegetable soup—the *soupe paysanne* of France—must also be given out daily, the peasant providing his own bread. Happy parties of eight or ten from a distant village often come in a cart, and bring their own barrel of wine along with them.

In Italy they shake down the olives, or knock them down with poles, and for this reason the Italian olives are not so highly esteemed. The olives are put into the presses within twenty-four hours of being picked. The fresher the fruit, the finer the oil obtained from it. Italians are often careless of the fruit, and allow it to lie about and ferment before pressing it; hence the frequent rancidity of Italian oil.

The Provençal olive-mill is very simple and primitive, and consists of two huge stones, the upper one turning in a trough by means of a horse or mule that patiently treads round and round whilst the picker presses in the olives from the top. After the olives are crushed they are put into bags and crushed again. The first pressing yields the finest oil, and the only one that retains the flavour of the fruit. This is the oil that salad-makers seek after and seldom obtain, for only a very few realise that the per-

fect salad cannot be made without a genuine oil and good vinegar made from wine. The *huile vierge*, as they call it in Provence, is, perhaps, only fully appreciated in its native country, for the true Provençal claims that the northern palate cannot differentiate in oils. For the second pressing the olives are saturated in hot water, and the oil and water are afterwards separated by skimming the oil off the surface of the water. It is kept in stone crocks until the frost comes, as frosty weather is the best time in which to bottle and ship the oil. The last residue of the oil used to go to make a certain soap; but, alas! even this fine soap so firmly believed in by many is now very much adulterated.

For eating, the Provençals allow the olives to get very ripe and very black. They are best when they drop off the trees from sheer old age. Then they are pierced with forks, and laid in brine, afterwards to be preserved in olive-oil impregnated with the flavourings of various herbs. Sometimes a handful of salted anchovies and peppercorns is thrown into the oil to flavour it before being poured over the fruit.

The olive harvest finishes up with picturesque rejoicings, and the Provençal *farandole* is danced with much enthusiasm and vigour. We saw it in London a few years ago, when there was a craze for the reproduction of ancient dances.

Average English cooks do not use olives much, preferring to keep them for *hors-d'œuvre* and savouries. There is an austerity about them that the English palate, used to homelier, sweeter things, does not relish. Yet they have their uses. The richness of roast-duck is by the French tempered by a sauce with olives. Olives stuffed with anchovies or sardines, with touches of lobster and lemon, are a favourite prelude to a meal. The English substitute for the olive, our native sloe, is singularly abundant on our hedgerows at times, but it is harsher than the olive, and lacks its rich Southern flavour. Olives and cheese go well together, just as two strong but diverse characters often become friends.

Gourmets whose hearts are set upon incomparable salads know how difficult it is to get really genuine olive-oil and wine vinegar. Only the South produces both in perfection, and it is their perfect blend that produces the perfect salad. Most salad-oil is really cotton-seed-oil, and has never seen or felt the meridional sun. Yet a little bird tells us that the genuine thing (*premier jus* too) can be had in Soho for less money than you pay an English grocer for an inferior article.

PINCHER MARTIN, O.D.

CHAPTER II.—*continued.*

WHEN Martin joined, the ship was in dock-yard hands, and a special routine was in force; and at seven o'clock, by which time the men who had been granted night-leave had returned, the decks had been finished and the guns cleaned. A quarter of an hour later the bugle sounded off 'Cooks,' when the men detailed as cooks of messes went to the galley to procure their own and their messmates' breakfasts; and at seven-twenty-five the boatswain's mates heralded the first meal by more shrill whistling, and the hungry men trooped below.

Breakfast, Martin always thought, was quite the most satisfactory meal of the day, and with the addition of a couple of canteen kippers, or eggs and bacon, he generally managed to acquit himself pretty well. The dietary of the modern bluejacket is a liberal one, while a paternal Government allows each man the sum of fourpence a day with which to purchase extra articles. An hour was allowed for the meal, for washing, for changing into the 'rig of the day,' and for smoking; and at eight-twenty-five the men were once more summoned to work. Shortly before nine o'clock the guard of marines and the band marched on to the quarterdeck; and when two bells struck, the marine bugler sounded the 'Attention,' the guard presented arms, the band played 'God Save the King,' and every officer and man on deck stood rigidly at the salute while the White Ensign was slowly hoisted. This ceremony is carried out at nine A.M. in winter, and an hour earlier in summer.

At nine-five came a warning blast on the bugle, followed five minutes afterwards by 'Divisions.' This was the usual morning muster, at which the entire ship's company—seamen, marines, stokers, and artisan ratings—fell in in their respective groups. The seamen themselves were divided up into four 'parts of the ship'—forecastle-men, foretopmen, maintopmen, and quarterdeckmen; and each was responsible for, and so far as possible manned, the guns in its own particular portion of the vessel. Each division, moreover, had its own lieutenant in charge, one or two midshipmen, and its quota of petty officers and leading seamen.

Now, Martin knew all about saluting. He had learnt how to do it by spending many weary hours in a windy barrack square at Portsmouth paying obeisance to a red brick wall under the horny eye of an irascible gunner's mate. He was aware that one saluted when addressed by an officer, when meeting an officer in uniform ashore, and the first time each morning one passed any particular officer on board ship. He had also been taught that it was customary to raise a hand to one's cap when the band played

'God Save the King,' and, for some reason unknown to him, whenever one had occasion to go on the quarterdeck. He was not aware that in medieval days the ship's shrine or crucifix was always kept on the quarterdeck under the break of the poop, and that, on passing, officers and men made an obeisance. Hence the origin of 'saluting the quarterdeck.'

But all this was nothing to the saluting which took place every morning at divisions.

The game started by the 'captain of the top'—the senior petty officer—calling the division to attention, saluting, and reporting it 'Present' to the midshipman, Mr Henry Taut. The midshipman, returning the salute, produced a notebook, mustered the men by name, and satisfied himself that the petty officer's statement was correct; and then, touching his cap, made known the fact to Lieutenant Tobias Tickle, R.N. The lieutenant, walking round the ranks, found fault with irregularities in the men's attire, or asked searching and personal questions as to when they had last washed, shaved, or had had their hair cut, and requested the midshipman to make a note of the delinquents' names.

Taut acquiesced, with a salute.

The inspection complete, Taut saluted Tickle, and Tickle saluted Taut, and the lieutenant then walked aft to the quarterdeck, saluted as he reached it, approached the commander, saluted again, and reported his men 'Present.'

The commander returned the courtesy, and murmured, 'Thank you.'

When all the divisions had been reported present, the commander, in his turn, reported the fact to the captain, with another salute. The latter raised his hand to his gold-peaked cap and muttered, 'Carry on, please;' whereupon the commander held up his hand, a bugle blew, some one forward tolled a bell, the band on the after shelter-deck played a lively march, and the divisions marched aft to the quarterdeck for prayers. Here they were halted, and presently the chaplain appeared from one of the after-hatches, with his surplice flapping in the breeze. He did not salute. He was bareheaded.

'Ship's company! 'Shun!' from the commander. 'Off caps! Stand easy!'

The chaplain read the prayers, followed by the usual intercession for those at sea: 'O Eternal Lord God, who alone spreadest out the heavens, and rulest the raging of the sea; who hast compassed the waters with bounds until day and night come to an end: Be pleased to receive into Thy almighty and most gracious protection the persons of us Thy servants, and the fleet in which we serve. Preserve us from the dangers of the sea and from the violence of the enemy; that

we may be a safeguard unto our most gracious Sovereign Lord King George and his Dominions, and a security for such as pass on the seas upon their lawful occasions.' . . .

'The dangers of the sea,' 'the violence of the enemy,' 'a safeguard,' 'a security.' The words conveyed little to Martin's mind when first he heard them. Less than a year later, in the autumn of 1914, he had come to learn their true meaning.

The short service was over by nine-twenty, and was followed by a quarter of an hour's hard physical drill, conducted by the lieutenants of divisions. This strenuous exercise was a daily feature of the routine, and there was no doubt that it kept the men in excellent condition. At any rate, Pincher was generally perspiring freely by the time it was over.

This finished, both watches were piped to fall in, and the various parties of men were detailed for the day's work. The commander, with a notebook, would be present on the quarterdeck, and would hold a hurried conversation with the first lieutenant, gunner, boatswain, and carpenter, all of whom required men for the performance of various odd jobs.

'Party painting on the mess-deck yesterday, fall in aft!' would come the first order. A group of about a dozen men and a petty officer, clad in ancient, paint-stained overalls, would detach themselves from the remainder. The first lieutenant, in charge of the mess-decks, gave his detailed orders to the petty officer, and he, in turn, doubled his men off to their work. 'Two hands from each part of the ship of the starboard watch, and a leading hand from the foretop, fall in aft!' The captain of the top told off the men, who were then taken charge of by the gunner—a warrant officer—who required them for restowing the small-arm magazine. Next the boatswain wanted a party, some for refitting rigging, and others for drawing stores from the dockyard; and, lastly, the carpenter took his toll for some purpose best known to himself.

The Royal Marines, meanwhile, had been sent down below to clean the flats, under the orders of their own non-commissioned officers; and when the various flat-sweepers and the mess-deck sweepers had been detached to their work, the remainder of the seamen were detailed for their labours, under the direction and supervision of their petty officers. There were always a hundred and one different jobs to be done. Nobody was ever idle in working-hours, and sometimes Martin found himself armed with a pot of gray paint and a brush to touch up bare portions of the superstructure. On other mornings he was detailed to scrape and red-lead rusty plates on the ship's side, or to holystone a particularly obstinate section of deck which was not quite up to the mark. At other times he found himself told off as assistant to a fully qualified A.B., one Joshua

Billings, who was quite the best hand in the ship at splicing or putting an eye in a wire hawser, neither of which is a job for an amateur. Martin liked this sort of work, for he was keen and anxious to learn, and the able seaman taught him far more in an hour than he could pick up elsewhere in a fortnight.

The worthy Joshua, by reason of an inordinate thirst and capacity for malt liquor, had served in his present rank for seven years, and did not hesitate to give the youngster good advice. 'It's like this 'ere,' he would remark, deftly tucking in an obstinate strand of springy wire. 'It's beer wot's bin the ruin o' me, and I don't mind ownin' it. I've bin in the navy ten years come January, and most o' them men wot served along o' me as boys in the trainin'-ship is now petty officers. I reckons I'm as good a man as they is aboard a ship; but, though I was rated leadin' seaman once, I dipped the killick* abart six weeks later for comin' off drunk. It's beer wot done it; I can't keep orf it, some'ow, when I gits ashore. Give us that there ball o' spun-yarn, young fella.'

'Ard luck,' Martin murmured, handing the spun-yarn across.

The hoary-headed old sinner shook his head and gave vent to a throaty sigh. 'No,' he said sadly, 'I reckons it wus orl right. The commander 'e sez to me, "Billings," 'e sez, "w'y is it you can't go ashore without gettin' a skinful?" "It's like this 'ere, sir," I tells 'im. "I 'as the rheumatics werry bad, an' as soon as I gets 'longside a pub I comes orl over a tremble, an' directly I gets inside I meets with hevill companions." "Rheumatics!" 'e sez. "I've 'eard that yarn before; an' has for your hevill companions, my man, you ain't a baby!" "No, sir," sez I, gettin' rattled, "I ain't; but directly I gets a pint inside me my legs orl gets dizzy like." "A pint!" sez 'e, werry surprised. "Surely it wus more'n a pint." "Well, sir," I sez to 'im, "maybe it wus a quart; I can't 'xactly remember." "Several quarts, I should think," sez 'e, waggin' 'is 'ead. "You wus werry drunk." "No, sir, not drunk, only a bit shaky like," I sez, though I knowed orl the time I'd bin properly tin 'ats. "Well," 'e sed, shakin' 'is 'ead werry sad, "I should 'ave liked to 'ave given you another chance; but I'm afraid you ain't fit to be a leadin' seaman. You must go before the capt'in." I sees the owner, an' has a consequence wus dipped to A.B.; an' now I shall never be anythin' else. Sad 'istory, ain't it?" concluded Joshua sadly. 'But it's beer wot's done it, so look out you don't get meetin' with hevill companions.' He solemnly winked one eye.

Now, Joshua Billings, A.B., though officially a bad hat, was one of the best seamen in the ship

* A 'killick' is an anchor, which is the badge worn by a leading seaman. 'Dipping the killick' means that the badge is removed, and that its wearer has been disgraced to A.B.

when there was any work on hand, and the commander knew it. Only that fatal predilection for beer kept him from rising to the top of the tree. Martin took his advice to heart, and was rather proud to have him as a friend.

At ten-thirty in the forenoon came a ten-minute stand easy for smoking; after which work was resumed until eleven-forty-five, when the decks were cleared up and the bugle sounded 'Cooks.' At noon there was dinner, the staple meal of the day; and half-an-hour later the cooks of messes were summoned on deck to receive the allowance of grog for the members of their messes. The rum, mingled with its due proportion of water, was served out with some ceremony. It stood in a huge brass-bound tub bearing in brass letters the words, 'The King: God bless him;' and when the recipients had assembled in a long queue with their mess kettles and other receptacles, the liquid was solemnly measured out by the ship's steward, under the supervision of the warrant officer and the petty officer of the day. Martin, being under twenty, was not officially allowed to partake of the beverage. He tasted it once, and it made him cough and splutter.

At one-ten the bugle sounded 'Out pipes,' and the decks were cleared up; and at one-thirty the forenoon's work was resumed. At three-forty-five labour, except for odd jobs done by the watch on board, was over for the day; and at

four o'clock came 'evening quarters,' a repetition of the morning 'divisions,' without the prayers and music. Immediately afterwards the men went to tea, and the watch whose turn it was to go ashore were sent on leave till seven o'clock the next morning. Each man, provided his character was good, thus got leave every alternate night; but Martin, with the rest of the newly joined ordinary seamen, was not allowed out of the ship after ten P.M.

Saturday afternoon was generally a half-holiday, and a portion of the ship's company went away till seven o'clock on the following Monday; while on Sundays those men left on board had the usual service in the forenoon, and did no work that was not absolutely necessary.

Every day of the week supper came at seven-thirty P.M., and after this the hammocks were piped down and were slung on the mess-decks. At eight-thirty came another clearing up of the ship, and at nine o'clock the commander, preceded by the master-at-arms with a lighted lantern, and followed by the sergeant-major of marines, made his final rounds of the ship to see that everything was correct for the night, and the galley fires extinguished. At ten o'clock the boatswain's mates 'piped down,' and everybody was chased off to his hammock. So ended the day.

(Continued on page 319.)

AT WILHELMSHAVEN.

By W. C. MITCHELL.

WELL might the Kaiser covet the sheltering ports and happy havens of our sea-girt isle, for a more forsaken corner of the globe than Wilhelmshaven it would be hard to find. Readers of Seton Merriman's novels will recall his Dantean description of the dreary Friesland marshes; and the spot where the Kaiser decreed that a naval base should be dug out, and with feverish energy, for a striking-place at Britain, reveals Nature at her dreariest. The land is forbidding to a degree, and the silt is a constant menace; the soil, black and peaty, is broken up into mud-flats and pools, and the gray skies and leaden waters form a fitting frame for the gloomy landscape.

A railway line from Oldenburg to Wilhelmshaven skirts the circle of Jahde Bay, across whose waters bitter winds from the North Sea sweep and tear. The traveller, looking out at the carriage window, sees, across the Weser, Cuxhaven, the apex of the triangle being at Heligoland. As the spires and smoke-stacks of Wilhelmshaven appear over the dunes, depression seizes on the traveller's soul, a feeling that is deepened when he enters the town itself. It is so frankly a war-centre as to be

minatory. Barracks stand up, stark and bald. The chief objects of interest are the powder-magazines, the parade-ground and saluting base, and the Imperial dockyard and harbour with its dry dock. Instead of the cheery reveille of bugles or the rataplan of drums, there is heard only the dull and sullen thud of the giant steam-hammers at the dockyard or the tramp of marines breaking into the goose-step as they pass an officer. According to the custom of the German navy in peace-time, the ships are deserted from October to March, the period for recruiting and land drill, and the sombre sounds of the port invest them weirdly.

When one remembers the War Lord's many-sided mind, there is a disappointing lack of originality in the uniforms of German naval ratings. Among both officers and men it is only a poor copy of our British style. Dogs are much 'affected' by the officers, not the dachshund, as one would be inclined to imagine, but the pert little English terrier being the favourite; and the officers' uniform, except that it lacks the loop on the gold sleeve-band, seems at first glance to be identical with ours. Closer inspection, however, reveals some startling and

amusing incongruities. That abbreviated article known variously and vulgarly as the 'dicky,' or the 'Isle of Man shirt,' is 'worn,' to use the term of the fashion journal, instead of the more formal and less exiguous garment of civilisation. Goloshes, too, instead of the British sea-boot, are used to protect the feet of the German officer from the damp; while that form of footgear reserved on our side for elderly and obese gentlemen and charwomen, and known generally as 'elastic-sides,' but irreverently dubbed 'jemimas' by the cockney, finds general favour among German officers.

A navy with world-pretensions, but with no traditions, cannot afford to be out of the lime-light or to be other than solemn. Accordingly, before the war, Wilhelmshaven was everlastingly being boomed in *Die Flotte*, the journal of the German Navy League. This organ was scattered broadcast and gratis, in restaurants, barbers' shops, inns, commercial establishments, and literary clubs, its function being to convince a deluded people that Germany's future lay upon the water. Its practice, however, was on a par with Germany's other fiction-factories, an example of which may be recalled in the perverted version given of Admiral Seymour's consideration for the insignificant German contingent which formed part of the Tientsin Relief Force in 1900. The Admiral's order, 'Germans to the front,' became in the superheated imagination of German naval journalists 'Britain's cry for help!'

The German navy being imbued with a portentous idea of its importance, and lacking a due perspective, life at Wilhelmshaven is prodigiously solemn and profoundly dull. At times a human touch was given by the arrival of bands of school children from far-off Thuringia or distant Bavaria, to be shown round the ships under the guidance of some retired officer; for it is to be remembered that less than one out of every hundred children in Germany has ever seen the sea. But, for the most part, it is a place of all work and no play, save for high stakes at the officers' casino. The lower ratings play football, but in summer; the officers, however, have few or no sports, save cards and the skittle-alley with its wooden 'cannon-fodder.' Duelling, too, occupies an important place, especially as the Kaiser looks with a lenient eye on even a fatal result by pardoning the culprit.

Jollity such as marks a British port would be frowned on as highly reprehensible at Wilhelmshaven. To sing 'We'll hang Old Square-Toes on a sour apple-tree' in its German equivalent, or refer to a much-adored martinet as 'Old Double-Chin,' as the British tar dares and does with the best mind in the world toward the said superior officer, would be regarded in the Teutonic navyman as rank blasphemy against Von Tirpitz and *lèse-majesté* against the Kaiser. In former years it has been the Kaiser's wont to come to

Wilhelmshaven in January to swear in the new recruits, in conscious or unconscious imitation of the great Napoleon. For rites on such a huge scale the dockyard drill-hall was converted into a war-temple; a large crucifix, flanked by two mammoth candles, stood on a field altar, which was shut in by symbolic piles of shot and shell, and guarded by cannon. A Protestant chaplain and a Roman Catholic priest acted as acolytes to the Imperial ministrant. At the close of the Communion service, the Kaiser, taking his position under a canopy, preached a sermon, often taking as text, 'Honour thy father and thy mother,' in which he proved, by reasonings incontrovertible under the circumstances, that he was the father and Germany the mother alluded to by the sacred writer, and that blind obedience to their revealed will would bring in Germany's Golden Age. The famous *Punch* cartoon picturing the Kaiser at his orisons uttering the words, 'Let us prey,' may therefore have been, not a skit, but a sketch of Wilhelm at Wilhelmshaven.

ON THE CLIFFS.

REST here awhile upon this green decline—

Here where the grass is thick beneath our feet,
And flowering tendrils with the gorse entwine.

Dear heart, dear heart, that earth should be so sweet!

See how the infant violets shyly peep

Toward the radiant sky and scented air;

The blue sky merging in a bluer deep.

Dear heart, dear heart, that earth should be so fair!

Yon cliffs, ethereal in their filmy mist,

Float like a dream-cloud bathed in orient light,
Sink beachwards where the foam has churned and kissed.

Dear heart, dear heart, that earth should be so bright!

The bells of yellow daffodils are moist,

Screened from the ardour of the burning ray
By half-open'd petals with the dew rejoiced.

Dear heart, dear heart, that earth should be so gay!

The tend'rest of these leaves, the youngest flowers,
Shall make a garland on your hair to rest;
And you shall wear it all the laughing hours.

Dear heart, dear heart, that earth should be so blest!

Forgotten rain is fresh upon the trees,

Like April kissing May their buds among;
The sea's low voice is murmuring to the breeze.

Dear heart, dear heart, that earth should be so young!

Here let us then relax the inquiring mind;

Complacent Nature, knowing these things best,
Proclaims the peace 'twixt God and all mankind.

Dear heart, lie down with me, lie down and rest.

G. H. BROWNING.

Chambers's Journal

SEVENTH SERIES

HUMANITY.

By J. J. BELL, Author of *The Whalers*, &c.

IN the Atlantic, within sight of the Outer Hebrides, are scattered islets not marked on ordinary maps or mentioned in school geographies. You will, of course, find them on the proper chart; now and then a mariner may name one or two of them—perhaps with a curse; and fishermen of Lewis, Harris, Uist, or Barra might have a tale to tell. But these islets lack the human interest of St Kilda; the utility of the Flannan Group, with its lighthouse; the sensation of white, remote Rockall, where the codfish abound, and many a great whale has given up the ghost under the bolt of the Norwegian harpoon gun, where also, not so long ago, a Scandinavian liner came to bitter grief. The islets lie solitary, in pairs, in clusters. Some are barren rocks or mere reefs; others support grass and wild-flowers, but never a human habitation, and rarely a human tread.

Now there is a pair called Gasgeir Môr and Gasgeir Beg—that is, the Gasgeirs big and little. The latter is low, bare but for seaweed, altogether unlovely, a haunt of the gray seal. Lying off it on a calm day, peering into the wondrous clear depths, you will surely shudder to meet the emerald glares of the swarming, inquisitive dogfish. Near to its slippery margin you may come upon round flat corks marking the positions of traps sunk by a venturesome lobster-fisher from Harris.

By contrast, at least, Gasgeir Môr is beautiful. The coastline of a mile or so forbids at every turn, but above its rifts and buttresses abounds grass of a richness that makes the sheep placed there for a season the 'best fed' in the Hebrides. At midsummer scabious cast a lovely azure flush athwart the whole of the verdure. About the centre of the islet lies a large brown pool of rain-water. To walk there alone for the first time is trying to ordinary nerves. The woeful bleat of retreating half-wild sheep is almost drowned in the menacing yells and raucous mocking laughter of the magnificent gulls that wheel about you in legions, and follow you wheresoever you turn. Lie down, however, and presently you will find peace from their clamour of threats and abuse, for they, too, will settle on the protruding rocks around you to regard you in suspicious silence, occasionally broken by a sneering squawk. Then you begin to hear the endless sigh and sob and

gurgle of the swell about your prison; and, no matter how bravely the sun may shine, a new melancholy will enter your soul.

But not on many days of the year is a landing on Gasgeir Môr a possible adventure. The swell is never so light that the stoutest little craft may kiss those ramparts with impunity. The water, indeed, is deep enough, as you best realise when about to re-embark—clinging above it, chin to rock, fingers and toes in harsh or slimy crannies, while the boatmen, waiting the favourable instant to slip in under you, call advice and encouragement. A fathom or so beneath your feet the swell heaves and sucks, and you wonder whither it would take you once it got you. At last the men you cannot see bid you gently yet curtly 'let go.' Three to one that you hesitate for what seems an age; and that having upset their calculations, you slither through their arms, to land heavily among the lobsters, or perchance on top of a seal shot at Gasgeir Beg while you were exploring Gasgeir Môr. Well, nerves or no nerves, the Atlantic sees to it that no man finds this islet familiar to his foot.

Old Macleod would have told you as much, and he had made the landing oftener than any man alive. Boyish curiosity had inspired the earliest adventure. Age's necessity—let us believe—compelled the present. He lay on the turf bordering the highest part of the islet, gazing northwards. His hand outstretched would have hung over space. A lad, also named Macleod, a distant kinsman, lay beside him; a sturdy youth, but lame—else he had not been there then. He had helped the old man with the boat since the beginning of the war. He had not been on Gasgeir before, and he did not appear to be enjoying the experience. He would have told you frankly, for he was no coward, that he was afraid of the old man. The old man—who had grown old quite suddenly three months ago—was mild and gentle to look at, but the ceaseless, silent moving of his bearded lips was uncanny to see. Thus he had talked for close upon two hours, which is to say from the moment of landing.

They had left their home in the Harris loch at dawn. For the first time in the lad's knowledge the master had brought his seal gun, a short, weighty weapon built entirely of steel,

the burnished barb of its harpoon protruding, the strong, thin line attached thereto coiled carefully within the tube running under the barrel. A gift from a Norwegian, it had not been fired by Macleod for many years. But it was evidently in first-rate order.

Half-way to the Gasgeirs the wind failed, and they took to the oars. It was heavy work, and by the time they reached the lobster-traps old Macleod was complaining of exhaustion, and a homing breeze was not to be hoped for.

'It is fine weather,' he said suddenly. 'The creels can wait till the morning. We have food. We will sleep on Gasgeir Mòr. I can pull no more to-night.'

It was not for the lad to demur. Besides, he was keen to land on Gasgeir Mòr, and he had hopes of persuading the old man, after he had rested, to promise him a shot with the strange gun on the morrow.

So, with skill won of long experience, old Macleod took the boat to the one likely landing-place, and there moored her in such wise as to minimise the risks of bumping and scraping during the approaching night. Happily every natural sign pointed to a continuance of calm weather.

It was intensely still now, in this the first hour after sunset. The unruffled swell was no more than a drowsy motion. Less than a mile away a cluster of submerged skerries heaved, as it seemed, black backs fringed with foam from the glassy hollows. For long the lad watched them come and go, thinking of huge whales, fancying he heard the gasps of their emersions, the hisses of their subsidence; thinking also of shipwrecks and drowning men. Then his gaze lifted beyond them, and sought to separate the distant Seven Hunters (Flannan Isles), while he remembered the mystery of the three lightkeepers there whose disappearance has not been explained to this day. Later he turned on his side, and beheld, fully forty miles to the sou'westward, St Kilda, with her more desolate sisters, Boreray and Soay, all merged in a single shape, tiny yet clear cut in the afterglow. Above it hung a canopy of purple cloud hemmed with bronze—the only cloud in that majestic dome of sky. But the lad regarded all those sights less from interest in them than from desire to avoid the sight of his companion's lips.

Yet inevitably his eyes were drawn again to the mild, weary, tanned countenance. The lips were still busy. The lad was no lip-reader, yet he guessed what these lips were saying. They were retelling the story, with prayers and curses, of how a good son, Ronald, dearly beloved, mate of a trawler, had been murdered, rent asunder, by a shell fired from a submarine. And while the kindly lips moved the weather-seared fingers stroked and patted the seal gun at his side.

With a fresh effort the lad withdrew his gaze,

and as he shifted his position the old man touched his arm and spoke at last.

'Listen, Lachlan my lad, listen to me; for I will be telling you the dream I have dreamed on seven Sabbath nights running—the dream that will be coming true before we are a night older. And it is surely the second sight I have, though I was not knowing it till the great grief came upon me.'

For a little while he paused, then proceeded softly, yet coldly and very slowly, using now and then a modern English word for which there was no satisfying equivalent in the Gaelic.

At the end of half-an-hour the lad was shuddering. Perhaps the white sea-fog which had gathered during the recital had affected him in conjunction with the old man's dream. The fog rose no higher than the islet. Overhead, the pale sky was but slightly hazy. Twilight lingered. There would be no real darkness that night.

So fascinated, so terrified, was he by the old man's talk, that minutes passed after its ending before the lad ventured to call attention to a sound which had been coming from the fog with growing distinctness during the latter part of the story. Now he spoke, steadying his voice, as one anxious to change the subject.

'There is a steamer out yonder where no steamer with a knowing skipper would be. She is going slow, but she is coming'—

'It is the dream coming true,' said old Macleod in a matter-of-fact tone. 'Now I will give my thanks to Almighty God.' Rising to his knees, he clasped the barrel of the upright gun between his hands, raised closed eyes to heaven, and began fervently to pray.

The lad clapped his hands over his ears, and buried his face in the grass and scabious.

Unfaltering, the soft voice, warm with feeling, went up, telling the Almighty the simple history of a poor fisherman, his wife, their children—notably their first-born, Ronald, dearly beloved; confessing personal sins more or less lovable, easily pardonable even by man; pouring out the agony of a sudden, heart-rending loss; finally, offering humble gratitude for the wondrous, goodly gifts of dreams and second-sight. Ere the voice fell mute, a faint breath was dispersing the sea-fog.

The lad, his ears still covered, lifted his face and peered through the rifted veil across the waters northward. Dimly, at first, he beheld that which the old man had so lately foretold.

A vessel that had been a submarine was approaching the Gasgeirs. Still a mile away, she came on very slowly, appearing to be scarcely under control. She yawed and wallowed like a creature with a mortal wound. Her deck was a wreck, her periscope gone, her hull battered and rent just above the water-line. Her conning-tower seemed to have escaped serious damage.

But she would never again dive—save to her grave. And she was not so far from that, for the skerries, now wholly submerged, lay between her and her only possible haven, Gasgeir Môr. The man whose head appeared above the conning-tower ought to have read danger in the glossy swirls ahead, but he may not have had all his wits; his head was bandaged.

Macleod's prayer came to an end; he opened his wet eyes. In the same moment the lad rose, his arms out ready to wave a warning. Probably he would have been too late, even were his first signals observed. However, they were never made. His wrist was clutched, and he was wrenched back to the turf.

'Oh, oh!' he sobbed, 'they will all be drowned.'

'Not all, Lachlan; not all,' answered the soft voice, cold once more.

The hapless craft came on, her motors making extraordinary noises, as though working in an agony. Through the clearing atmosphere she was seen to be getting lower in the water. Yet she might float to reach Gasgeir Môr, if only those sunken skerries—

She struck!—soundlessly, so far as the two watchers could have told. Her bow ran clear out of the water. For a moment she wobbled, then slid backwards, rolled heavily, recovered, and began to settle down.

Two human figures appeared to fall over the edge of the conning-tower. A third was literally blown forth to a sickening, bursting sound; he spread-eagled through the air for an appreciable period, took the water flat, and in a burst of spray disappeared. And once more the vessel that had been a submarine cocked her bow, and, stern first, dived for the last time.

'The boat!' screamed the lad, pointing to the two swimmers. 'We must get the boat'—

'Peace, Lachlan; peace.'

The lad collapsed. Minutes passed ere he recovered.

'Macleod, Macleod,' he cried, 'they will both drown!'

'Not both, Lachlan; not both.'

In a little while there was only one swimmer. He came on bravely, yet it seemed to the helpless Lachlan that he could never reach Gasgeir. Nevertheless he reached it with what seemed a last despairing stroke.

As his hand found a hold on the nearly sheer rock, almost directly beneath the prone watchers, the old man rose steadily to his feet and stepped to the very verge.

'A life for a life,' he said in his best English; 'a clean harpoon for a dirty shell!' The effort in fine words was wasted.

The dazed, ghastly face, twenty feet below, turned upwards, and positively grinned with hope. A single word came up. With its foreign accent it sounded like 'Help!'

Macleod, his face bleak and gray, put the ugly gun to his shoulder and pointed it downwards. His weather-bitten finger crooked on the trigger. He took deliberate aim.

With a strangled cry the lad leapt upon him from behind, clasped him round, and dragged him backwards. A crash split the silence, and ten thousand drowsy birds rose shrieking. The barbed bolt flashed aloft, the coils of line rippling out straight in its wake.

Old Macleod wrenched himself free, but before his passion could find vent the lad had sprung to the verge, flung up his arms, and dived. For a space the old man stood helpless and shaken, under an awful revulsion of feeling, then staggered forward and looked over.

Lachlan was already clinging to the rock beside the exhausted swimmer; he was actually lending support to the latter.

'Hold on, Lachlan; hold on, good lad,' wailed Macleod, and began frantically to haul in the harpoon-line.

'Never mind that,' cried the lad. 'Go, bring the boat. I have a good hold. I can keep him up.'

The old man stiffened as at an electric shock. 'That man! I will not save him! By God, no!'

'Then, by God, I will drown with him!'

There was a brief pause. And Macleod said gently, 'I will bring the boat—for you, Lachlan.'

Lachlan spat out some brine. 'Your word that you will save us both, or I let go now. The water is very cold. Macleod! oh, Macleod! I tell you I *will* let go, and what will you say to your Ronald when he looks down on you in hell?'

At that the half-crazy old man groaned and stood irresolute.

And, in the hush, the enemy, comprehending everything save their strange Gaelic speech, spoke so brokenly, so feebly, that the man above just caught the words, 'Thank you, friend. Now I will go.' And he slid downwards into the sucking swell.

But the lad, his heart like to burst, drew him back from doom, and held him safe.

'Macleod!' gasped the lad, eyes rolled upwards. 'Macleod!'

Macleod was not there. Ere long they heard his quavering shout, and the sound of oars plied frantically.

GERMANY'S STRONGEST WEAPON.

By D. GOLDBLATT, Editor of *Yiddish Lexicon*, &c.

The more languages you know
The more times man you are.

SCHOPENHAUER.

IF one language makes a man wise once, two should make him doubly wise, three trebly wise, and so on in proportion. Generally, the British people are averse to any foreign language. They show signs of irritation at the mere sound of it; their narrow-mindedness on this particular point has resulted in a feeling that by speaking a foreign language one is committing adultery against one's own. But that species of patriotism is rather old-fashioned. Since one finds the existence of several nations under one language, and many languages within a single nation, language is no more the essential pillar of nationalism. Present day nationalism, from a broader point of view, depends more on religion, upon racial home sentiments, and a political constitution than upon anything else. The Jews of to-day do not speak their traditional language; in fact, the Jews speak to-day nearly every language in the world; yet they feel distinctively as a race, and if they had a political existence somewhere they would feel nationally also.

To-day, when nations must, for the benefit of their existence, exchange intercommunications one with another, the study of foreign languages is absolutely indispensable. The nation that neglects this study will some day find itself put out of the running by a smarter competitor. The nation that knows foreign languages knows also other nations' methods of fighting. One cannot defend one's self effectively without knowing the tactics of one's opponent.

The cultivation of lingual science amongst the German-speaking people is more than equal to that of all other nations combined. The Germans not only speak every language of the world, but can also teach nearly every nation its own language. There is a sense in which one could say that what the British fleet has done for Britain is little compared with what philology has done for the German-speaking people. To them that branch of science is life itself. A German values your education by the number of languages you speak. A man with only one language is to him not educated at all. The German knows that he can fight the whole world in peace and in war with this weapon, while he cannot do that with any other.

It has been admitted by many British educational authorities and writers that the German education is superior to our own, but I do not remember any of them pointing to this particular branch of education. They have not learned many languages themselves, and they cannot,

therefore, grasp the power that lingual science gives to technical students. Technology under the guidance of a polyglot will naturally be more efficient than under a monoglot. 'Languages are the keys of science,' and the nation that holds the keys of universal science must naturally be most efficient.

The present position of the Entente Ambassadors in the Balkans is noteworthy in this connection. They are still thinking about what this or the other Balkan State is going to do, whilst Germany may have already sealed its fate. A German Ambassador is not likely to leave his native land before he has mastered the language of the country he is accredited to. In concluding an article under the heading *Die Kriegsdolmetscher*, the *Woche* says: 'After all, Germany has good reason to be proud of her war interpreters' organisation. We are marching with them at the head of all nations. They speak to us in any language, and they get an answer.'

Observation will undoubtedly bear out this statement to its full meaning. Germany could not move so rapidly in every direction without being fully informed about everything she ought to know. She has stalked into nearly every country without fear of treachery on the part of any enemy. She is now confronted with a multitude of people that speak more languages than the Tower of Babel can account for, and yet she experiences no difficulties on account of that. We heard that General Townshend's army suffered a defeat near Baghdad due to treachery on the part of the Arabs that were fighting on the British side up to the crucial point, but nothing of the like on the German side. We heard much about many uprisings against German muddlings in Turkey, Austria, Bulgaria, &c., but nothing of any result. The German war interpreters are now talking English, French, Flemish, Dutch, Walloon, Turkish, Arabic, Bulgarian, Serbian, Greek, Roumanian, Lithuanian, Russian, Polish, Chinese, and Persian. That they know each of these languages efficiently can be seen from the results they achieve.

The acquaintance with a language that one picks up on a train serves more as material for the humorist than for any purpose, and when life is at stake insufficiency of a language is more fatal than total ignorance. Every language has words that have more than one meaning or sense. If you like to consult the Oxford *New English Dictionary* for a few examples, you will find the word 'fail' in sixteen senses, 'father' in eighteen, 'fast' in twenty-three, 'fancy' in twenty-three, 'false' in twenty-nine, 'fair' in

thirty-four, 'face' in thirty-nine, 'go' in ninety-four, 'come' in seventy-five, 'fall' in one hundred and thirty.

In trade, the German commercial traveller has given to Germany everything she now possesses. By carrying his interpreter between his teeth he comes through cheaper and surer than any other. By that means he was even driving British trade out of British territory. For instance, the Boer farmer will give ear to a traveller who speaks Dutch to him in preference to one who speaks any other language. The German travellers speak Dutch, and it is only lately that the British merchants in South Africa have recognised this obstacle in their way of business by employing canvassers and correspondents who speak and write Dutch. Statistics of German exports will show that whilst Germany was losing yearly over eighty million marks in her own colonies, she was making many times that sum on foreign ground. What success the German had in raising rebellion among the Boers might also be credited in part to their knowledge of the Dutch language.

This language-war is one that Germany wages against all nations in peace-times. She trains her army for it in the school from boyhood. She creates in school children a pride in the knowledge of foreign languages. She teaches them how to make the best use of such knowledge, and she encourages every institution assisting in this direction. For one who knows both nations, there would be little difficulty in proving that for every Englishman who speaks German there are about sixty Germans who speak English. There are in Germany Shakespeare societies that study Shakespeare's works in the original; Goethe or Schiller do not receive corresponding attention in Britain. In Halle there appears a very learned journal, *Anglia*, that deals with English philology only; and in Heilbronn, *Englische Studien*. In Britain there is no such publication about German or even English philology. Schletter of Berlin published a collection of the best dramatic works in English, revised and corrected by Professor Burckhard, a German, and dictionaries in about thirty foreign languages. Fred. Mode of the same place published a large collection of British and American authors, and a series of French dramas, of which more than six hundred volumes have already appeared; also a large collection of Italian authors. Baron von Tauchnitz reprinted over four thousand English classical books, which shows there is a good market for them in Germany. A British publisher would foresee certain failure in any attempt to imitate Tauchnitz. What the German has done for English no Englishman has done for Germany. Dr Felix Flügel's *German-English and English-German Dictionary* finds no rival in Britain. Brockhaus of Leipzig have printed and published books in about fifty

languages; an English firm who tried to handle foreign type ended in the bankruptcy court. In Leipzig, Berlin, Frankfurt, Heidelberg, and Halle are printed and published grammars and dictionaries for every language in the world. The Germans are not only the printers of the world, but also the type-casters for the majority of the civilised nations.

How much Germany has gained by all this in the present war need not be entered into here. It is enough to point to the difficulties our own soldiers are experiencing on the different fronts. They cannot converse even with their best friends in arms. On the other hand, we have the mischief the German Ambassadors have accomplished in the Balkans and in the United States. The real strength of the German secret service lies in the workman-like knowledge her spies possess of foreign languages, and in the consequent difficulty of spotting them. If one may judge from the average Briton's knowledge of foreign languages and foreign nations, as compared with the average German's knowledge of these things, one is justified in concluding that our secret service system can never have formed an adequate offset to the German secret service.

The present war can only mean a temporary crushing of Germany. When it is over, her traders will undoubtedly try to make up their losses at our expense, and they will certainly succeed if we do not arm ourselves with the weapon of thorough linguistic attainments. Organisation is needed to further this purpose. Encouragement must be given to the study of foreign languages. Those who have acquired more than one should be employed in preference to the others. The Government should assist or subsidise schools that render assistance in this direction. For commercial examinations two or three foreign languages should be compulsory. Every business house of any importance should be provided with one or two foreign correspondents. These are the bare essentials of success.

A friend of mine tells me that he knows of a professor of languages who is now working in one of the Glasgow munition factories as a common labourer. That is no credit to a civilised country like this. That man's place is in a school, or at least in the drill-hall, where, along with a number of refugees from our allied nations, he could impart to our soldiers at least a working knowledge of the languages that would be useful to them at their respective fronts.

We have merely enumerated a few of the advantages gained over us by our opponents through their attention to linguistic science. We must now inquire, Why do we feel averse to following an example? Why do we not see it? Is it not a case of being too proud to learn?

The writer was once asked by a high dignitary, 'How does a foreigner manage to pick up such a clear knowledge of English in a short time, whilst many a learned Englishman toils over it in the dark all his life?' The answer was, 'The first language learnt is learnt involuntarily, and by an infant mind; the second is learnt by choice, and by one fully developed. The child can ask no questions of its own at first; the adult can; and, having his own language as a standard of comparison, his desire to get to the root of the matter enables him to master the new one.'

This is only true of one of another nation taking up English, not *vice versa*. The reason is that no Englishman is sure of his spelling. In spite of the remarkable simplicity of its grammar, English is not at all an easy language, owing to the antagonism between its spelling and its phonetics; and the mere fact that this antagonism is tolerated makes it plain how little the English know of their own language. 'A man who is ignorant of foreign languages,' said Goethe, 'is also ignorant of his own;' and the application of this remark to the English is seen in the extraordinary question—heard even among men of letters—'How do you spell it?' In a phonetic language the need for such a question never arises; and a language whose spelling is so much at variance with its phonetics requires the developed mind of an adult, and cannot be absorbed by that of a child. By filling a child's head with odds and ends—that is to say, with unpronounced letters—you break its line of reasonable and systematic thought. The non-phonetic spelling now used by the English, having no logical foundation, cannot be learned, but must be impressed, or, rather, forced, on the memory, which should be kept for higher things than mere scraps. In his passage through life the Englishman will more or less forget them. His own language is too much trouble, and his aversion to others is the natural consequence. Thus, while the German aspires to the mastery of all the languages of the world, the Englishman remains a slave to his own archaic spelling.

The foreigner minimises this trouble, making short work of his subject. Having already the command of an easier language, as he has, he can venture to attack a difficult one; and, bring-

ing a mature mind to it, he sees how to avoid useless labour. The Germans have learnt to look upon a language as a tool which requires sharpening from time to time if good work is to result. The almost phonetic spelling of their language enables them to acquire a clear style, and with that style they appear in English. It is true that German is not entirely free from orthographic defects; but these are gradually being removed, and their lease of life will soon be at an end. The Germans have reformed their spelling because they are linguists; the English have failed to do so because they are not, and they are not because they have failed to do so. Thus they are in a vicious circle. This fact is the more to be regretted because the simplicity of their grammar, if coupled with simplified spelling, would have given their language an unrivalled position.

Unfortunately every attempt to reform English spelling has been coldly received. Irresistible time forced on the development of the spoken far in advance of the written language. The pen has lagged so far behind the tongue that reform is now thought to be impossible. It is sad to know that though there is nothing wrong with the capacity of the English mind, yet it is kept caged by weakness of will like a lunatic in an asylum. English and German come both of one stock. Why should one be so forward and the other so backward? What is the use of sacrificing national existence to a false pride? Why let an opponent have the upper hand? Let us look at the result of this to-day, and think seriously about it. Only the blind could hesitate; it is childish to play the part of the blind with the eyes open.

When Grimm, the great German philologist, came to judge the English language by its phonetics, his verdict was that it has 'a veritable power of expression such as never stood at the command of any other language of man.' When Dean Swift says, 'Our language is extremely imperfect, and in many instances it offends against every part of grammar,' he must have been feeling that difficulty in his own language which, it is here maintained, accounts for the Englishman's aversion to learning any other.

THE DAY OF WRATH

CHAPTER XIV.—*continued.*

SOMEHOW, on 7th September 1914, there was a hitch in the naval programme devised by the *Deutscher Marineamt*. The Belgian packet-boat *Princess Clémentine* steamed from Ostend to Dover through a smiling sea, unvexed by Krupp or any other form of *Kultur*. Warships, big and little, were there in squadrons;

but gaunt super-Dreadnought and perky destroyer alike were aggressively British.

England, too, looked strangely unperturbed. There had been sad scenes on the quay at the Belgian port, but a policeman on duty at the shore end of the gangway at Dover seemed to indicate by a majestic calm that any person

causing an uproar would be given the alternative of paying ten shillings and costs or 'doing' seven days.

The boat was crowded with refugees; but Dalroy, knowing the wiliness of stewards, had experienced slight difficulty in securing two chairs already loaded with portmanteaus and wraps. He heard then, for the first time, why Irene had fled so precipitately from Berlin. She was a guest in the house of a Minister of State, and one of the Hohenzollern princelings came there to luncheon on that fateful Monday, 3rd August.

He had invited himself, though he must have been aware that his presence was an insult and an annoyance to the English girl, whom he had pestered with his attentions many times already. He was excited, drank heavily, and talked much. Irene had arranged to travel home next day, but the wholly unforeseen and swift developments in international affairs, no less than the thinly veiled threats of a royal admirer, alarmed her into an immediate departure. At the twelfth hour she found that her host, father of two girls of her own age—the school friends, in fact, to whom she was returning a visit—was actually in league with her persecutor to keep her in Berlin.

She ran in panic, her one thought being to join her sister in Brussels, and reach home.

'So you see, dear,' she said, with one of those delightfully shy glances which Dalroy loved to provoke, 'I was quite as much sought after as you, and I should certainly have been stopped on the Dutch frontier had I travelled by any other train.'

The two were packed into a carriage filled to excess. They had no luggage other than a small parcel apiece, containing certain articles of clothing which might fetch sixpence in a rag-shop, but were of great and lasting value to the present owners.

At Charing Cross, while they were walking side by side down the platform, Irene shrieked, 'There they are!' She darted forward, and flung herself into the arms of two elderly people, a brother in khaki, with the badges of a Guards regiment, and a sister of the flapper order.

Dalroy had been told at Dover to report at once to the War Office, as he carried much valuable information in his head and Von Halwig's well-filled note-book in his pocket. He hung back while the embracing was in progress. Then Irene introduced him to her family.

'You'll dine with us, Arthur,' she said simply. 'I'll not tell them a word of our adventures till you are present.'

'You could have heard a pin drop,' was the excited comment of the flapper sister when endeavouring subsequently to thrill another girl with the sensation created by Irene's quiet words. Literally this trope was not accurate, because the station was noisier than usual. Figuratively it met the case exactly.

Lady Glastonbury, a gray-haired woman with

wise eyes, promptly emulated the action of the British army during the retreat from Mons, and 'saved the situation.'

'Of course you'll stay with us, too, Captain Dalroy,' she said with pleasant insistence. 'Like Irene, you must have lost everything, and need time to refit.'

Dalroy murmured some platitude, lifted his hat, and only regained his composure after two narrow escapes from being run over by taxis while crossing Northumberland Avenue.

A newsboy tore past, shouting in the vernacular, 'Great Stand by Sir John French.'

Dalroy was reminded of Smithy, and Shiney, and Corporal Bates. He saw again Jan Maertz waving a farewell from the quay at Ostend. He wondered how old Joos was faring, and Léontine, and Monsieur Pochard, and the curé of Verviers.

Another boy scampered by. He carried a contents bill. Heavy black type announced that the British were 'holding' Von Kluck on the Marne. Dalroy's eyes kindled. *His* work lay *there*. When the soldier's task was ended he would come back to Irene.

CHAPTER XV.—'CARRY ON!'

AFTER a few delightful days in London, Dalroy walked down Whitehall one fine morning to call at the War Office for orders. Irene went with him. He expected to be packed off to France that very evening, so the two meant to make the utmost of the fast-speeding hours. The Intelligence Department had assimilated all the information Dalroy could give, had found it good, and had complimented him. As a Bengal Lancer, whose regiment was presumably in India, he would probably be attached to some cavalry unit of the Expeditionary Force; from being a hunted outlaw, with a price on his head, he would be quietly absorbed by the military machine. Very smart he looked in his khaki and brown leather; Irene, who one short week earlier deemed *sabots en cuir* the height of luxury, was dressed *de rigueur* for luncheon at the 'Savoy.'

Many eyes followed them as they crossed Trafalgar Square and dodged the traffic flowing around the base of King Charles's statue. An alert recruiting-sergeant, clinching the argument, pointed out the tall, well-groomed officer to a lanky youth whose soul was almost afire with martial decision.

'There y'are,' he said, with emphatic thumb-jerk; 'that's wot the British army will make o' you in a couple o' months. An' just twig the sort o' girl you can sort out o' the bunch. Cock yer eye at *that*, will you?'

Thus, all unconsciously, Irene started the great adventure for one of Kitchener's first half-million.

She was not kept waiting many minutes in an anteroom. Dalroy reappeared, smiling mys-

teriously, yet, as Irene quickly saw, not quite so content with life as when he entered those magic portals wherein a man wrestles with an algebraical formula before he finds the department he wants.

'Well,' she inquired, 'having picked your brains, are they going to court-martial you for being absent without leave?'

'I cross to-night,' he said, leading her toward the Horse Guards' Parade. 'It's Belgium, not France. I'm on the staff. My appointment will appear in the *Gazette* to-morrow. That's fine; but I'd rather'—

Irene stopped almost in the middle of the road. 'And you'll wear a cap with a red band and a golden lion, and those ducky little red tabs on the collar! Come at once and buy them! I refuse to lunch with you otherwise.'

'A man must not wear the staff insignia until he is gazetted,' he reminded her.

'Oh!' She was pathetically disappointed.

'But in my case,' he went on, 'I am specifically ordered to travel in staff uniform; so, as I leave London at seven o'clock'—

'You can certainly lunch in all your glory,' she vowed. 'There's an empty taxi!'

Of course, it was pleasant to be on the staff, and thus become even more admired by Irene, if there is a degree surpassing that which is already superlative; but the fly in the ointment of Dalroy's new career lay in the fact that the battle of the Aisne was just beginning, and every British heart throbbed with the hope that the Teuton hordes might be chased back to the frontier as speedily as they had rushed on Paris. Dalroy himself, an experienced soldier, though he had watched those grim columns pouring through the valley of the Meuse, yielded momentarily to the vision splendid. He longed to be there, taking part in the drive. Instead, he was being sent to Belgium, some shrewd head in the War Office having decided that his linguistic powers, joined to a recent first-hand knowledge of local conditions, would be far more profitably employed in Flanders than as a squadron leader in France.

Thus, when that day of mellow autumn had sped all too swiftly, and he had said his last good-bye to Irene, it was to Dover he went, being ferried thence to Ostend in a destroyer.

A month later he was back in London. Antwerp had fallen, the Germans had swept through Belgium, and with the return to England of that portion of the Naval Division which had escaped internment in Holland, Dalroy's special task was at an end. Securing a passage in the last boat which left Ostend, he reached London on the day previous to that on which Germany began her desperate attempt 'to hack her way through' to Calais.

So Irene and her true knight met once more, only to part again after three blissful days. This time Dalroy went to France, and took his place in the fighting-line. He endured the

drudgery of that first winter in the trenches, shared in the gain and loss of Neuve Chapelle, earned his majority, and seemed to lead a charmed life, until a high-explosive shell burst a little too close during the second day at Loos. He was borne off the field as one nearly dead. But his wounds were slight, and he had only been stunned by the concussion. By the time this diagnosis was confirmed, however, he was at home and enjoying six weeks' leave.

Nothing very remarkable would have happened if the Earl of Glastonbury, an elderly but most observant peer, had not created a rare commotion one day at luncheon.

Dalroy was up in town after a few days' rest at his uncle's vicarage in the Midlands; he and the younger members of the household were planning a round of theatres and such-like dissipation, when the Earl said quietly, 'You people seem to be singularly devoid of original ideas. George Alexander, Charlie Hawtrey, and the latest revue star provide a sure and certain refuge for every country cousin who comes to London for a fortnight's mild dissipation.'

'What do you suggest, dad?' demanded Irene.

'Why not have a war-wedding?'

'Oh, let's!' cried the flapper sister ecstatically.

Dalroy swallowed whole some article of food, and Irene blushed scarlet. But 'father' had said the thing, and 'mother' had smiled; so Dalroy, whose wildest dreams hitherto had dwelt on marriage at the close of the war as a remote possibility, bestirred himself like a good soldier-man, rushing all fences at top speed.

The brother in the Guards secured five days' leave; a wounded but exceedingly good-looking Bengal Lancer was empanelled as 'best man' (to the joy and torment of the flapper, who pined during a whole week after his departure); and, almost before they well knew what was happening, Dalroy and his bride found themselves speeding toward Devon in a fine car on their honeymoon.

'And why not?' growled the Earl, striving to comfort his wife when she wept a little at the thought that her beautiful daughter, her eldest-born, would henceforth have a nest of her own. 'Dash it all, Mollie, they'll only be young once, and this rotten war looks like lasting a decade! Had we searched the British Isles we couldn't have found a better mate for our girl. He's just the sort of chap who will worship Irene all his life, and he has in him the makings of a future commander-in-chief, or I'm a Dutchman!'

As his lordship is certainly not a Dutchman, but unmistakably English, aristocratic, and county, it is permissible to hope that his prophecy may be fulfilled. Let us hope, too, if Dalroy ever leads the armed manhood of Britain, it will be a cohort formed to render aggressive war impossible. That, at least, is no idle dream. It should be the sure and only outcome of the world's greatest agony.

THE END.

THE HARDENING OF OILS.

By P. S. ARUP, B.Sc., A.I.C.

DURING recent years a development of far-reaching importance has taken place in the industries connected with the fatty oils and fats. The increased demand for solid fats of high quality in the rapidly growing margarine industry, together with the enormous consumption of fats and fatty oils in the soap industry, accentuated the desirability of a satisfactory solution of a problem of long standing—namely, the conversion of fatty oils into solid fats.

The fatty oils, which may be classed as liquid fats, occur abundantly in nature; they are largely obtained by the pressing of various seeds—as, for example, those of the cotton plant (which is cultivated on a large scale in America, Egypt, and other parts of the world), the Manchurian soya bean, the arachis nut (popularly known as the ‘monkey nut’), and many others. In addition, we have the whale and fish oils, which are of less value owing to their peculiar taste and smell. Of solid fats, on the other hand, the natural sources of supply are more limited. The chief solid fats are beef and mutton fats, coconut-oil (which is obtained by pressing the dried fleshy portion of the coconut), and palm-oil. Coconut-oil is largely used as a basis for the so-called ‘nut margarine,’ its only drawback being that it is of rather too soft a consistency; while palm-oil, as usually obtained, is too impure to be used for edible purposes.

Discover a means of converting liquid oils into solid fats on a commercial scale, and you will have brought about something approaching the desirable state of affairs dreamed of by the alchemists of old, who speculated on the transmutation of the base metals into gold. The accumulated labours of generations of scientists have given to the modern chemist a greater insight in distinguishing those problems which may be attacked with increased chances of success, and which none the less partake of the romantic nature of the great problem of the alchemists.

The history of the birth of the process by which large factories are converting liquid oils into fats varying in consistency from that of butter to that of a hard, brittle wax is noteworthy. It affords a striking illustration of the way in which researches undertaken by the chemist, primarily on account of their scientific interest, have later been made use of in solving technical problems and creating great industries. The key to this particular problem was the discovery by two French chemists, Sabatier and Senderens, that certain substances which are characterised by the chemist as ‘unsaturated’ may be made to combine with hydrogen gas to

form ‘saturated’ substances, provided that finely divided nickel, prepared in a special way, be present. The presence of the nickel is essential to the process; it causes the hydrogen and the substance operated upon to come into chemical contact, but does not enter into the composition of the finished product. Now it has long been known that the fatty oils, as a class, were chemically speaking less saturated than the solid fats. It therefore occurred to the technical chemist that the discovery of Sabatier and Senderens might be applied commercially to the hardening of oils, and in 1903 an English patent taken out in the name of W. Normann claimed such a process. It was, however, not before the end of the last decade that the process had been perfected so as to be workable on a commercial scale; the translation of the discovery of the scientist into actual practice entailed much thought and experimenting on the part of the technical and engineering chemist, a fact to which the voluminous patent literature on the subject bears witness.

An important feature of the process is that the products obtained are themselves to all intents and purposes genuine fats. They may, generally speaking, be used for the same purposes as the natural fats, such as the manufacture of hard soaps; while physiological experiments have shown that they may be used as edible fats, a fact which admits of their use by the margarine manufacturer.

It is interesting to note that the hydrogen gas which is made to combine with the oils to form solid fats was previously not of very great technical importance, its chief use being in the charging of airship balloons and for producing the oxy-hydrogen flame. As a by-product of the process for the manufacture of chlorine by passing an electric current through brine, it was often allowed to escape unused, whereas now special processes have been designed for its manufacture for the specific purpose of hardening oils.

For the United Kingdom alone, the annual imports and exports of fatty oils and fats, and their chief products, probably amount in value to something like one hundred million pounds sterling in the aggregate. A process which is capable of so profoundly altering the nature of such an important group of substances as the fatty oils, transforming them into fats of greater value, cannot fail to have an immense economic influence in the future, and for this we have first and foremost to thank the chemist working in his laboratory with the one aim of enriching his science by further discovery.

GOLD IN WAITING.

CHAPTER III.

SEEING this, the three small men wrote Ebenezer down as hopeless, and paid no further attention to him. For they knew that if by some miracle he should keep sober for a length of time sufficient to cause remark, so surprising a fact would reach the ears of at least one of them.

Besides, they were family men, with their livings to earn; and at this time of the year anybody with house-room to spare could make money by letting lodgings to the shire gentry and solid burgesses of Wayford who came to Sparcliff for the sea-bathing. For the golden sands of Sparcliff shelved gently, and there were no dangerous currents to trap a weak swimmer. Sparcliff, indeed, already possessed three stout bathing-machines, leviathans of wood and iron, tended by an old boatman and his wife. This dame, wading in waist-deep, gave to the young ladies, clinging timorously to the ropes, rudimentary lessons in swimming, and anon ducked the screaming children, in whose dreams she doubtless reappeared as a fearsome ogress, which indeed she looked, with her gray hair streaming over her shoulders and her huge bare arms almost black with sunburn and sea-water.

Perriker, Burden, and Maggs, these three respectable men, all lodged summer visitors; and their wives were nothing loath, for visitors paid handsomely for their accommodation, seeing that, if Sparcliff was not good enough for them, they had to travel a long way by coach to the nearest fashionable seaside resort. So in the busy times of summer, what with barbering, and shoeing, and baking, and making provision for visitors, the three small men forgot all about poor Ebenezer, till one day somebody mentioned in Perriker's shop that Mr Fancit had sold the White Cottages, in order, it was said, to pay a gambling debt.

The news gave the three some concern, yet they were not greatly surprised, for the income drawn from his property by the sparing John Fancit could have gone but a little way in the wasteful hands of his heir. Doubtless, previous to this, he had borrowed money from his bank; but, they conjectured, he must have been in straits to part with real estate, to sell four well-built cottages, always sure of tenants, out-and-out—to let go his ownership of them for ever. And what sort of a price had he got? None knew that at first; but it came out in time that a little leech of an attorney—not old Fancit's man of business, you may be certain—at Wayford had bought them. And when the three small men heard this they knew the lad had been robbed. They therefore, being solid business men, put their heads together, and said

they, Why should he not have come to us, for we would have paid a fair price for the property?

When, therefore, the busy summer season was over, and they had taken stock of their means at Michaelmas, they decided to call again upon Ebenezer, and again upon a Sunday.

Since his wife had left him Ebenezer had been living alone at the old house, save for Martha, who, for old association's sake, and because she knew not where else to go, had stayed on with him.

They came, the three of them, in their Sunday black, and found him, as before, lying on the couch, heavy-lidded and flushed after his Saturday night at Wayford.

'We wish you good-morning, sir,' said Burden, spokesman and leader of the party.

The young man surveyed the three grimly. This would appear to be their quarterly visit of inspection.

'Good-morning to you, gentlemen,' he said a little thickly. 'Pray take chairs, and forgive me for not rising, for I have a headache that would make Old Nick himself mend his ways.'

They sat down.

'And to what, may I ask,' added he, 'may I attribute the pleasure of this visit? The rector, perhaps, noticed my absence from church, and sent you to chide me?'

'The rector has grown too accustomed to the sight of your vacant pew, sir,' said Burden dryly, 'to regard your absence as a singular event. We have called, sir, on a matter of business.'

'Aha? Most stout upholders of Commandment the Fourth!' was Ebenezer's gibe.

The smith did not wince.

'Of a truth, Mr Fancit,' he replied, 'tis the only day on which we can count on finding you near sober; and as we are not of those who take advantage of a man in his cups,' he went on relentlessly, and disregarding the oath which slipped from Ebenezer's parched lips, 'unlike some of whom we have heard tell, we have come to make you a plain request, which is, that if you have property to dispose of, we might have the first offer of the same.'

The young man sprang to his feet.

'My father's will,' he said sharply, 'contained no clause to the effect that you should meddle in my affairs. If that is all you have come about, my good bottle-godfathers, you had best be gone!'

'Gently, sir,' said the smith. 'It is to your advantage to listen to our proposition. We are honest men, and will pay you a fair price for whatever you have to sell.'

The young man walked to the window, a con-

sidering mood on him. Then he turned sharply on the smith.

'My grazing-ground on the cliffs, twenty-eight acres of it, stretching from the Cove to the Gull's Nest—what would you pay for that, now?'

For the moment, as Ebenezer watched the smith's face, there was a look of his old father in his eyes.

'It is good herbage, and will never want for a tenant. It should be worth twelve guineas an acre, if it is worth a shilling, sir,' replied Burden.

The young man's eyes opened wide. 'And to-morrow, at noon, I put pen to paper for just one hundred and seventy-four guineas!'

Perriker drew a long breath. Timothy Maggs gasped. The smith, though it was the Sabbath, uttered a hard word.

'Because you are pressed for money?'

'Ay, and, with the heavy war-tax, money is hard to come by.' Ebenezer looked from one to the other. 'Any higher bid, gentlemen?' he asked mockingly. 'Going at one hundred and seventy-four guineas; going at one'—

Perriker's plump hand met the table with a bang. 'I will split the difference, sir,' he said. For, of course, he was a business man.

'Done with you!' shouted Ebenezer with delight, as he put out his hand. 'And let the little Jew be damned!'

And that was how 'Perriker's Land' was saved for Sparcliff (for, later, only a portion of it was built on, the barber in his old age saying the rest should be a playground for the children); and in this wise, in Sunday bargainings—which, circumstances altering commandments, could not have been unrighteous deals—every rod of Ebenezer's land, every tree, every stone, and every brick of his property passed to the three small men.

But how, you will ask, could three small men, village tradesmen, find the money? Why, they were all, to begin with, shrewd men; they had prospered; they were solid men; and when, with a fine hardihood, and determined that the jackal lawyer at Wayford should not fix his teeth in more of Sparcliff than he had already got, they went to the bank at Wayford to borrow, the bankers there obliged them readily.

You will say that they were only putting a little more money into Ebenezer's pocket than he would have obtained elsewhere to lose at the table; but that thought gave them no concern. They were for buying good property while it was to be had at a moderate price; and what sin was there in that?

Ebenezer seemed to be a brand that could not be saved from the burning. His visits did not end at Wayford. He would go to London, coming back in, say, a fortnight, with fine new clothes, but empty pockets, which the three small men had to replenish.

A queer set-out it was, and all this time not a

word from Alice, his wife, and hardly a glimpse, for late in the year a child had come to her. And only on Christmas Eve, coming back from London with his usual empty purse, did Ebenezer learn that a son had been born to his beggared estate. And he learned this, as seemed fit, at the 'Rose and Crown' at Wayford, from the bright-eyed girl who answered his call for hot brandy.

CHAPTER IV.

IT was not an old-fashioned Christmas, for rain, not snow, was falling heavily when Ebenezer descended from the coach at Wayford. He had posted up to London quite the grand gentleman, but his guineas were too few to allow him to post back. If the bad men at Wayford could pluck him, how could he have fared among the vultures of London? He had returned with empty pockets to do a final deal with the three small men: to sell them the old house in Sparcliff Street—the old house with the dead men's bones lying beneath it.

He did not stay so late as he might have done at the 'Rose and Crown,' toasting that bright-eyed maid who waited upon him, for he was clear-headed enough to remember that Martha was not expecting him, and therefore could have made no provision against his return. He had left his horse at the 'Rose and Crown' to be cared for during his absence. She whinnied with delight when he came into her stable. 'Well, I've one friend left, old lass,' he said, as he stroked her cold nose.

The rain of the green Yule poured down as he took the lonely road to Sparcliff. The brandy he had swallowed soon ceased to cheer him, and he rode with his chin upon his chest, as miserable a man as any that rode a cock-horse that night. For when it seems to a man that he has come to the end of everything, he is in sorry plight indeed. To live, a man must have something to live for; and what had he? His red-haired Alice was gone, and was living like a nun under her father's roof. The three tradesmen, his bottle-godfathers, had his bits of property. True, there was that four thousand pounds in the bank; but it might have been at the bottom of the ocean for all he was ever likely to have of it. The old man might have said at once that it was to build almshouses. All he had left, in fact, was a crazy old house in a sleepy street. Ebenezer wondered what he would do when he had spent the money the three small men would give him for it.

By the gaunt hedges rode the solitary horseman without a future. From the same wastrel mould many and many are struck—the man with vice in his bones and no will to combat it. The unco guid shake their heads over him; the judges fine him, imprison him, and sometimes

hang him. He is a bad lot. What devil is it lurks in the blood of such a one? Is he, as some believe, an unrepentant spirit re clothed with flesh, expiating the sins of a former existence when all went merrily and well with him?

Each man's life

The outcome of his former living is,
The bygone wrong brings sorrow forth and woes,
The bygone right breeds bliss.

The young rector of Sparcliff, with his serene, sober countenance, he, surely, in the past, according to this creed, was one who had fought temptation and conquered; who had passed through the crucible and come forth in shining triumph. Had he and this wretched equestrian, splashing through the mire to a home where no wife waits to gather him in her soft arms, equal chances in the past; one taking, the other leaving them?

It is, at any rate, noteworthy that the young rector, at this moment making his simple preparations in the old church for the morrow's festival, found no delight in the rattle of dice, the oft-filled glass, the leer of the wanton, the coarse jest; while similarly this horseman discovered no satisfaction in the simple joys with which the godly man was well content.

The horse reared suddenly, and then, finding the road again, was deep to her broad chest in

water. They had reached the dip of the road where the Cliff brook, usually a shallow ford, was now a rushing stream. Snorting with the shock, the beast plunged through.

'Well done, old lass!' cried Ebenezer with a laugh; 'though 'twas a pity no one was by to see how well the drunken Fancit sat you!'

They breasted the hill, and now the lights were twinkling cheerily from this and that gray-beard of a cottage. They clattered into the village central, and Ebenezer was home.

But the old house was in darkness. Dismounting, Ebenezer knocked thunderously upon the front-door. There was no response, but a door on the opposite side of the street opened, and a woman, her skirt flung over her head, came running across to tell Mr Fancit that Martha, not expecting to see him this side of the New Year, had gone, upon her mistress's invitation, to spend Christmas at Coatmayes Farm.

Uttering a brief word of thanks, Ebenezer stood gazing at the black exterior of his house. The woman who had come across looked at him a little pityingly, but she dared say nothing else to the fierce young man. His manner frightened these simple folk. The rain blew into her face, and she turned and sped back to her warm hearth.

(Continued on page 323.)

WITH THE GREEK ARMY DURING THE BALKAN WAR.

AN ENGLISH NURSE'S EXPERIENCES.

WHILE nursing in India in the year 1912 I read the daily accounts in the papers of the condition of things in Greece and Turkey. Being wrongly informed that the former had neither an army nor a navy fit for active service, I naturally came to the conclusion that, if the two chief factors of a nation's safety were in such a condition, certainly the Red Cross service, if it existed at all, would be almost *nil*.

On the outbreak of hostilities, having talked matters over with a friend, we offered our small services to the Greek Government as nurses to the wounded soldiers. It was not long before we received an answer by cable, couched in the following terms: 'Services gratefully accepted. Can you sail at once?'

Of course we agreed to do so, which entailed our starting at five minutes' notice to enable us to catch the steamer at Bombay. After a very exciting voyage, during which we transhipped at Port Said and Alexandria—we had frightfully rough weather, coming in for the tail of a cyclone, and being washed out of our berths by Father Neptune in no gentle manner—we at last made the port of Piræus, and thirty minutes in the train brought us to Athens. The first thing we intended doing on our arrival was to

snatch a few hours' sleep, of which we had run very short on board; but before we could realise our intention we heard the tramp of hundreds of feet passing in the street below. On looking out of the window we saw crowds of people, mostly dressed in mourning, from whom an occasional half-hearted shout arose, and were greatly surprised on learning a few minutes later that it was not a funeral procession we had been looking at, as we supposed, but the celebration of a great victory—namely, the taking of Salonica. Curiously enough, it looked then as if the Greeks had already realised what this great victory was to cost them a few months later.

As soon as possible we announced our arrival at the royal palace, and in the course of the afternoon we were given an appointment to present ourselves before the queen. We were very glad of this, as we were anxious to know when and where we were to start work. Here we were first received by a lady-in-waiting, and shortly afterwards by her Majesty in person. It is difficult to believe that this simple and gracious lady is a sister of Germany's great war lord. Her Majesty began by thanking us, and saying that she wished us to open a hospital in her name at Arta, a small, God-forsaken town in

Epirus, on the borders of Albania. Our object in going there was that we should be as near to the fighting-line as it was possible to get.

A few days later our party, consisting of two doctors and three nurses, with hospital equipment for fifty beds, left Piræus in a boat which was unworthy of the name, being more like a floating cesspool, owing to the fact that she had discharged her cargo of Turkish prisoners only a short time before sailing. We were thankful indeed when we arrived at Preveza, our first stopping-place. It was difficult to realise that this peaceful-looking spot had been the scene of a big battle only a few days before, until we saw the Krupp gun-carriages in the streets, stacks of blunted and gory bayonets, and heaps of Mauser bullets. Mixed up with these death-dealing instruments we found books of Turkish music and battered musical instruments. Inside the houses we could see what a ghastly rush there must have been—beds with the clothes tossed back just as the unfortunate sleepers had left them, and in the kitchens the half-cooked porridge still in the pots. Coperna, aptly named, was our final landing-place. Here we were disgusted to find that all the conveyances had been taken by some Turkish pashas, notwithstanding the fact that we had wired beforehand for some to be in waiting on our arrival. But a Greek chauffeur Tommy soon helped us out of our difficulty by borrowing, without permission, a large motor milk-van, which, we heard afterwards, had been built in America for sixty pounds.

After an hour's run at top speed, which is a pretty good record for even an American milk-cart, we reached Arta—a veritable east-end slum in the wilds—just as the shades of night were beginning to fall; and as it seemed impossible to find any decent lodging we applied to the General, and he and his staff very kindly placed their quarters at our disposal for the night. Here we met some of the officers who had recently returned from the battle of Preveza, and who had been eye-witnesses to some of the awful atrocities of which the Turks have been only too justly accused. The Greeks always swear before going into action that they will shoot themselves rather than fall into the hands of the Turks. We often looked back with pleasure and longing to the delightful afternoon tea which had been provided for us, and which, alas! was destined to be our last civilised meal for many months.

A few days later we found the Turkish consul's house; and after much labour and a great expenditure of soap and water we managed to render it fit to receive patients, and soon all our beds were full. Although the house was quite unsuited for a hospital, it was the best that Arta could produce. It was a one-storied building opening directly on the street, which fact was often the cause of embarrassment, as

we found it impossible to open the windows, notwithstanding that the lower halves were rendered opaque by means of white paint. The passers-by were so inquisitive that they thought nothing of thrusting their heads into the room and carrying on lengthy conversations with the patients whenever an opportunity offered. The house consisted of two large rooms on the ground floor and six rooms above, which were approached by very rickety stairs. As our patients usually came in batches of from three to seven, we had to use up every available corner. In fact, our big bath, which we had so much looked forward to using, had to give place to a bed. Most of our patients were suffering from wounds in the hands and lower limbs.

The cold was intense, and lasted well into January. Many of the unfortunate soldiers were victims to frost-bite, chiefly owing to their enforced inaction during the three months' blockade of Janina. During the whole of that time they were unable to remove their uniforms or their boots, so that the result may be better imagined than described.

While we were on night duty for the better part of three months, there was plenty of time left to do a little exploring in the daytime. The town of Arta itself consisted of one long street, which was generally overcrowded with all sorts and conditions of humanity—Jews and Turks, infidels and heretics. Great was our excitement when we saw the first batch of Turkish prisoners brought into the town. They were indeed the most sorry type of soldier we had ever seen, most of them looking terribly ill and half-starved. The officers, however, seemed in good condition, and were well clothed. This soon became a familiar sight, as prisoners and captured guns were being constantly brought in. The Turks always used Krupp guns, while the Greeks employed the Creusot, of French make. We went round once or twice to see what we could do for these unfortunate Turks, who were very grateful for having their wounds bound up, and for any other trifling services we were able to render them. They evinced their gratitude by presenting us with any small treasures they possessed, such as the brass seals, engraved with their names, which every Turkish soldier carries.

We had most of our meals at a dirty little restaurant in the town, owing to the want of proper accommodation in the hospital, which shortly afterwards was closed by order of the police, owing to its insanitary condition. At the end of three months we transferred the hospital to Preveza, where we remained until the fall of Janina, which had been daily expected for the last five months; but, thanks to the splendid generalship of the present King of the Hellenes, what might have been one of the bloodiest engagements of the war ended in a bloodless victory. The Greek royal family

had given one of the finest examples in history of the meaning of the word duty, and had spared neither strength nor means wherever it was possible to afford help.

At Preveza we had the same difficulty we had encountered at Arta in finding any building suitable for a hospital. At last we decided on the harbour-master's house, which was beautifully situated, looking out directly on to the sea, but was in a most deplorable condition. This meant many days of the hard work of scrubbing, whitewashing, removing rubbish—in fact, a most exhaustive spring cleaning. My ward had many windows, from which I could see the historical promontory near which the battle of Actium was fought, and where later on we gathered the lovely flowers of the asphodel with which to decorate our bare hospital when we were honoured by a visit from royalty, which occurred pretty frequently.

We determined to see Janina as soon as the last patient was discharged, although we were told it would be impossible to do so. However, after many difficulties and disappointments, we at last found a motor to take us. We left Preveza one morning at nine o'clock, and three hours later were in Janina. Our route lay through some of the finest and most varied scenery in Greece—century-old olive-groves, wooded slopes, and mountain passes. Just outside Preveza we passed the ruined city of Nicopolis, which at one time had been the centre of Roman power in Greece. Not until we saw the snow-capped summits near Bisane did we realise what hopeless and heart-breaking work it must have been to get the big guns mounted into position on these heights, which were exposed on three sides to the raking fire of an almost invisible enemy hidden away in the nearly impregnable mountain fastnesses of Bisane. What a wholesale slaughter must have resulted before the guns were finally in position! The horrible sights we frequently passed on the way—dead bodies of soldiers and animals in varying stages of decomposition, tainting the air for miles round—made us shudder to think what a real battlefield must be like.

Janina, an exceedingly strong fortress, is beautifully situated on a large lake, commanding a view which ought to make it one of the favourite spots of Europe; but it was hard to believe that it had been a seat of learning not so very long ago when one saw its streets and market-place now teeming with Turkish prisoners, who looked more like the aborigines of some barbarous country than twentieth-century soldiers. We visited some of the Turkish hospitals, and found that the condition of things was quite as bad as we had been told, the treatment meted out to some of the unfortunate patients who were too ill to help themselves being worthy of the dark ages. Some were shot by their doctors, and others received blows in the face that sent them reeling when, half-maddened by hunger and privation, they tried to struggle for food. The Greeks deserve the greatest credit for the splendid treatment they accorded their prisoners. They not only paid them at the same rate as the Greek troops, but whenever they were passing through towns *en route* for Athens or elsewhere they were permitted to enter the restaurants and shops and get as much food as they required. This magnanimous treatment generally meant a hungry time for the inhabitants for days afterwards, and I well remember the results of these locust-like incursions at Preveza, which could only boast of two restaurants. As we usually had all our meals at one of them, we had occasionally some exciting experiences. One evening, coming in rather late, we found our table occupied by a typical Cretan brigand. He was about six feet four, and his uniform was almost hidden by the formidable and warlike weapons he carried. We noticed that he looked fierce and violent, and spoke very angrily to the waiter for attending to us before him. Immediately after the waiter had brought us our first course, the Cretan hurriedly left the table, and directly afterwards we heard a revolver-shot. Every one rushed to the door, and we soon learnt the cause of the commotion. The poor waiter had been shot dead. It goes without saying that we had not much appetite for our dinner.

PINCHER MARTIN, O.D.

CHAPTER II.—*continued.*

III.

IN a mixed company of eight hundred and fifty odd souls, comprising seamen, marines, and stokers; boiler-makers, coppersmiths, and moulders; blacksmiths, plumbers, shipwrights, caulkers, carpenters, and joiners; butchers, bakers, and bandsmen; signalmen and telegraphists; ship's police, stewards, and writers—men of all ranks and ratings, of forty-and-one

different trades and persuasions—it took Martin some little time to find his own level. The subtle little differences between the various grades and ranks were rather puzzling, and, as a new-comer fresh to the navy and its traditions, he was constantly making mistakes. At first he imagined that any one who wore clothes of the ordinary shore-going cut, with a collar and tie,

was some one to be respected and called 'sir.' On one never-to-be-forgotten occasion he used the title in addressing a 'dusty-boy,' or ship's steward's assistant, a youth scarcely older than himself. For this he was seriously taken to book by his messmates, and had his leg pulled unmercifully.

Some of his shipmates, moreover, were not slow to take advantage of his ignorance as a 'softy' to amuse themselves at his expense. One ordinary seaman in particular, a fresh-complexioned Irish youth of bullying propensities, rejoicing in the name of Peter Flannagan, regarded a newly joined ordinary seaman as a gift sent from heaven for his especial amusement, though he himself had joined the ship only a few months before. He was for ever devising new schemes of petty persecution, until Martin's soul grew bitter, and he longed to retaliate. But Flannagan was larger and heavier than himself, and a direct assault could only end in defeat; so for a fortnight he stood the ragging without complaint, and nursed his grievance in silence. Then one morning he came late to breakfast to find powdered soap mingled with his food, pepper in his coffee, and Flannagan sniggering on an adjacent seat. He did nothing at the time, but that morning sought the advice of Joshua Billings.

That same afternoon Flannagan happened to be watch ashore. He had asked a messmate to sling a hammock for him, and when, at ten o'clock, he returned to the ship he promptly undressed and turned in. He had barely had time to get comfortably to sleep, however, when his foot lanyard gave an ominous crack. He knew what was about to happen, and tried to save himself, but in an instant found himself precipitated abruptly to the deck, feet first. Falling from a height of five odd feet, and landing in rather scanty attire across the sharp edge of a mess-table, is necessarily a painful business; and Martin, who was lying four tiers away, with one cautious eye peering over the edge of his hammock, could hardly restrain his merriment as the victim hopped round on one leg, swearing and rubbing a badly barked shin.

'What yer makin' all that bally row abart?' demanded the Irishman's next-door neighbour with a chuckle. 'Fallen out o' yer 'ammick, 'ave yer?'

'Did you cut me foot lanyard?' demanded the angry Flannagan.

'Me? Lord, no!' guffawed the other.

'Well, you knows 'oo did it, any'ow!'

'I knows nothin',' retorted the A.B., getting angry in his turn. 'If yer says I did it you're a bally liar. I'll give yer a clip 'longside the ear'ole if you ain't careful. Don't act so wet. Wot 'ave I to do wi' yer rotten 'ammick?'

'Some one's cut it,' the Irishman replied furiously, examining a clean cut through two

strands of the rope. 'If it ain't you wot done it, you must know 'oo it was. 'Oo was it? tell us.' He looked round to see if anybody else was awake, but every one seemed to be snoring peacefully. Sailors are very heavy sleepers sometimes.

It took Flannagan fully a quarter of an hour to repair damages and turn in again. It was bitterly cold, and he cursed vehemently.

But his troubles were not over yet. Towards eleven-thirty, when he had got thoroughly warm and was dozing off, he felt an uncomfortable, prickly sensation down his back and legs. He sat up blinking, and put a hand under the blanket to find a thin film of something warm and sticky. It resembled glue. The best part of a pound of finely ground brown sugar, cunningly insinuated between the bedclothes, is not a pleasant bedfellow. It melts with the heat of the body. The results are nasty in the extreme.

He leapt out, fuming. 'Ere!' he shouted, violently shaking the A.B. next to him. 'Ave you bin puttin' sugar in my 'ammick?'

'Look 'ere!' exclaimed the newly awakened man, 'I'm fair sick o' yer. I told you afore I 'adn't touched yer 'ammick, an' I sed I'd give yer a thick ear if yer went on worryin' me. Now I'm goin' to do it.' He hopped out, gave the astonished Irishman a box on the ear which sent him sprawling, and then stood over him with clenched fists. 'D'you want any more?' he asked grimly.

Flannagan did not.

Martin and the other men in the neighbourhood, meanwhile, had been waked by the disturbance, and were enjoying the fun. 'Go on, Ginger! Give 'im another!' somebody advised the A.B. 'Give 'im a clip under the lug! Slosh 'im one on the ruddy boko! Wakin' of us orl up at this time o' night!'

'Look 'ere, you blokes,' protested the still recumbent victim, 'some one 'as put sugar in my 'ammick!'

A roar of laughter greeted his words. His hearers were not sympathetic. They longed to see a really good fight, and there would have been more bloodshed if Flannagan, terrorised by the A.B.'s fists, had not thought discretion the better part of valour. He retired grumbling, to spend the rest of the chilly night on the hard mess-table, wrapped in a greatcoat.

At five-forty-five the next morning he sidled up to Martin, as the latter sat drinking his cocoa. 'Look 'ere!' he exclaimed aggressively, 'was it you wot done that to my 'ammick last night?'

'Done wot?' asked Pincher, grinning innocently.

'Cut my ruddy foot lanyard an' put sugar on my blanket,' the Irishman shouted, advancing threateningly with his fists clenched. 'I see'd

yer larfin' last night, an' yer larfin' now. If it wos you 'oo done it I'll'—

'Stop yer bloomin' noise, Paddy!' chipped in Strumbles, who was always inclined to be irascible in the early morning. 'If yer wants ter fight Pincher you'd best take 'im on in the dog watches arter tea, not at this un'oly hour o' the mornin'.'

'But if it was 'im wot cut'—

'Don't chaw yer fat!' growled the leading seaman, giving the Irishman a push in the chest. 'If it was Pincher wot done it, I reckons you arsked for it. If you comes makin' a row 'ere I'll land you one on the conk, so you'd best clear out!'

Popular opinion was evidently not on his side; and, seeing how affairs stood, Flannagan slouched off, vowing vengeance on some person or persons unknown.

But he never had his revenge; for, though he had a shrewd suspicion that Martin was somehow responsible for his discomfiture, he could never fix the blame on him for certain. The tables were turned at last, and Pincher suffered no further inconvenience at the hands of Peter Flannagan. The end had justified the means. Joshua Billings, A.B., was an adept at dealing with a young and bumptious ordinary seaman who made himself objectionable.

CHAPTER III.—WORK AND PLAY.

I.

'NICE sort o' craft, isn't she?' growled the first lieutenant, eyeing the grimy collier lying alongside. 'Enough to break the heart of a plaster saint!'

Tickle, the junior watch-keeping lieutenant, nodded in agreement. 'She's broken mine already,' he observed dolefully. 'How on earth we're going to take in six hundred tons from her the Lord alone knows.'

Chase, the first lieutenant, refilled his pipe. 'I'd like to get hold of the blighter who charts these colliers,' he mumbled savagely. 'This one doesn't appear to have a winch that'll lift more than half-a-ton; and as for her hatches, lord! they're only the size of—of that.' He could think of no suitable simile, so held his hands out a couple of feet apart.

'You should just see her whips, No. 1,' put in the watch-keeper. 'They were new in the year one; used by Admiral Noah in the Ark, by the look of 'em. I tried to lift one of the cross beams in No. 1 hold just now. Took me about twenty minutes to get the winch to gee to start with. Then, when I'd gingered it up, and had got the beam in mid-air, the whip parted, and the whole caboodle came down with a crash. It would have gone clean through her bottom if there'd been no coal in the hold.'

'M-yes. I heard the yelling,' observed Chase. 'Any one hurt?'

'No. A silly young ass of an ordinary seaman—chap called Martin, who's just joined—jolly nearly got it in the neck, but not quite, luckily for him. It weighed the best part of half-a-ton, and it missed him by about six inches. He'd have been done in all right if his head had been in the way.'

'Silly blighter!' said the first lieutenant unsympathetically. 'What the dooce did he want to get in the way for?'

'Ask me another,' laughed Tickle. 'Some of these O.D.'s keep their eyes in the back of their head. However, this chap seems a bit better than some of 'em, though that's not saying much. He had the fright of his life, though, and won't do it again, I'll bet.'

The first lieutenant snorted.

(Continued on page 322).

THE LAND THAT HOLDS MY HEART.

I'm going back to Scotland when the springtime comes again,
When the mavis are singing up and down the shady glen,
When the primroses are starring balmy banks and bonny braes,
And the hawthorn shakes her lovely blooms athwart enchanted ways;
When the cuckoo calls within the woods I'll sail across the sea,
To that dear old land that memory shrines—the best of lands for me!

That hope leaps up within my breast, my starved heart throbs and thrills,
To see again those daisied slopes, those well-beloved hills;
To hear the brook's low murmur, the wild rush of flood and stream—
Ah, what echoing music mingles with the sweetness of my dream!
The still blue lochs, the dark pine-trees! Oh, far across the foam
The witching voices of the past are calling, calling, Home.

'Mid the mists of purple mountains, 'mid the surf of restless seas,
Beat on by sudden tempests, swept by wind and ruffling breeze,
That little Isle that holds my heart all fair and lovely lies,
With her rippling rainbowed beauty and her blue-gray, changeful skies.
Oh, bright upon a thousand lands the sun may rise and shine,
But ne'er upon another that's so loved and dear as mine!

There's many a weary night between, and many a long, long day,
When old autumn's cloak will fold her, and her skies be dull and gray;
But when in loveliness she wakes 'neath winter's melting snow,
Oh, then my pulse will quicken! oh, then my bosom glow!
Then far across the surging seas that most blessed ship will part,
That will bear me to Old Scotland—to the land that holds my heart!

MARY M. CURCHOD (MYRA).

Chambers's Journal

SEVENTH SERIES

MARMADUKE.

By JOHN FOSTER, Author of *The Bright Eyes of Danger*, &c.

I FIRST met him on delectable Speyside at a shooting lodge among the great tumbled hills above the river. The lodge was not his, but he was to be found there during most of the year.

He looked, and as a matter of fact was, half German. He was Scotch, I think, on the distaff side, but, beyond a capacity for silent reflection, showed few of the qualities usually attributed to that far-seeing and lusty race; self-seeking or 'canny' he might have been, but I saw no signs of vaulting ambition in him. Pleased to throw in his lot with the society of a friend whom he knew and understood, he made the most of his happy obscurity in country quarters, going his daily round placidly in great and obvious contentment.

The lodge on Speyside is lonely; a place set down in the wilds where the heather creeps close to the house, soft peat-scented airs steal through the open windows, and the wary '*Go back! Go back!*' of the grouse at the edge of the moor breaks the hush of autumn mornings. I had escaped for a few days from the tyranny of stuffy weather, hot pavements, and town garb to the champagne air of heathered hills and the comfort of old tweeds and sensible boots. My host, Jim Gordon, introduced me to his friend on my arrival. I confess to a mild surprise, for Jim (although I say it myself) was supposed to be particular in his choice of friends. They were usually well-bred, well-set-up, often amusing, travelled, interesting men of the world in the best sense of that much-abused phrase.

But Jim's crony—for I soon discovered their extraordinary friendship—was underbred and undistinguished-looking. His manners were third-rate. He yawned twice in my face in the first ten minutes of our acquaintanceship. His table customs had more than a suggestion of Teutonic thoroughness in them; and his name (not his fault, of course) was Marmaduke! He had a far-away brown eye, and, *horresco referens*! his hair was too long. But to put him down as an 'intellectual' on the strength of these external deficiencies would be a mistake. He wrote not at all. Music and the kindred arts meant less than nothing to him. Indeed, he often pointedly left the room when any of us were at the piano.

He was self-centred and taciturn, forcing my attitude toward him to be one of indifference,

tinged with curiosity as to the nature of the bond between Jim and himself. The two were inseparable; although he did not fish, if his friend went for a day on the river he was with him, mooning on the banks or sitting patiently watching every cast as though mesmerised by the even voice of the Spey's current. He hated walking, but made a point of accompanying Jim to the hill, where he shared his butt, and condescended to help, with a detached, bored air, in picking up the birds after each drive. He would stand, monopolising the fire, for hours in gloomy introspection. Sometimes he listened to us with a pretence of politeness, but one had only to look at the brightening of his vague brown eyes, if Jim began to talk to him, to see that he regarded the rest of us as of no importance. His attitude to me more than bordered on rudeness. I was merely an appanage of his friend; and, truth to tell, I sometimes felt a twinge of jealousy of the scrubby little nonentity, for Jim was my friend of long standing.

Once, watching them start for a tramp by themselves, I turned to a fellow-guest with 'Nobody has a look in when the *fidus Achates* is nosing around!'

'No! I don't like the little beggar! His *Kulturkampf* shows up at meals; and, although I don't swallow all the newspaper scares just now' (this was before the war, of course), 'he prowls round the house in the evenings by himself in the queerest way. I came on him suddenly the other night in the avenue, and his reply to my "Hallo!" just escaped being a snarl. But there's no doubt Jim and Mr Marmaduke are great pals. I believe there is a reason for Jim's liking for him—something about a chance meeting, a queer friendship at first sight, and all that sort of thing. Well! well! If they are pleased, it's little or none of our business.'

Jim himself once or twice hinted at the source of the friendship, but it was not until I got him alone over a pipe one night that he gave me any details.

'He isn't much to look at,' he said; 'but he has no end of a heart, and in this tired old world it's a rare and refreshing thing to find gratitude. Quite between ourselves, I first came across him at a "Home" of sorts in London. It doesn't matter how I came to be there. He

was frightfully down on his luck, thoroughly "broke," and hadn't a friend in the wide world. I got him out of his awful environment, put him on his feet a bit, and—well, you can see for yourself that he is grateful.'

'Any one would be,' said I.

'Um! I don't know. I have known lots of people— Well, it doesn't matter. The point is, that I have cause to be grateful to him, apart from his companionship. You smile, but he is first-rate company. At least, I think so,' he said, a little stiffly. 'And one time he saved my life. I went off by myself over the hills, and since that day I have advised any one intent on going long distances over the Cairngorms to have some one with him. I was eight or nine miles from home, near the high tops, and was caught in the worst mist I ever saw. You could have clutched it in your hand; and to crown my day of stumbling about, trying without success to get my bearings, I smashed my leg over a boulder. You know the Cairngorms! I might have been there for days, but "Duke" went out with a search-party and took a line of his own. But for him, the foxes might have picked my bones. He found me, and went back to the others in the mist. Lord knows how he did it; but three hours afterwards he guided the gillies to where I was; so, if he owed something to me, he squared the deal that day.'

Came August 1914, and the habitués of the lodge above the Spey went to their jobs 'somewhere in France'—all except Marmaduke, who stayed at home. True, no regiment would have looked at him, but I happen to know that he never offered his services.

In those days, dark enough in one sense, but days that bid fair to be the brightest in the story of Britain, I was a doctor at a clearing hospital at the rail-head. A fleet of motor ambulances would come up to leave their freights of wounded, and pant off again with awful regularity for others; and among the gray ghosts on the stretchers was one whom I should not have known (for it is not easy to recognise a man with his head bandaged) had I not caught a smile. I looked again, and saw, with a sudden swelling of the heart, that the spectre was Jim. He had been badly mauled by shrapnel, and was unable to speak above his breath. All I could do was to put him into a hospital train bound for the base, give him a husky good-bye, and see him

whisked off with a crowd of other strange and piteous figures. He shook his head when I told him he would pull through.

Then my turn came. I was invalided home. After a week or two I began to pick up, and was nearly ready to go back, when I got a note in a very shaky hand from Jim. He was at Speyside. Had I time to go to see him? I went, and saw that my friend's business with this world was nearly over. Marmaduke was there, very quiet, very miserable, spending the whole of his time in the sickroom. He was doing no harm, and may have done a little good, for his friend wanted him there, and there he remained, hardly leaving the room until the end. . . . Jim was laid to rest beside many another of his name in the little kirkyard among his own hills, a quiet spot where the pines point proudly to the sky and the voice of a hill burn lingers in a *Gaudeamus*.

I was at my job in France when he died, and a year passed before I learned what became of Marmaduke. Angus the old Highland stalker told me.

'When the laird wass by wi't,' he said, 'his frien' wass never the same. No! Fra the minute he came back fra the kirkyard he would hardly go across the door; and if he did, it would be up the road somewhere near where the laird lies you would be finding him. He got shrunk and worn and gray as an old badger, the puir wee man! Many wass the time that we would be trying to put the heart into him, but no! Some would be saying that time would make him forget, but I wass knowing better. It wass myself that kenned by the eye of him, and the lost-looking way he had, that the heart wass out of him. One morning he wass nowhere to be seen. I said nossing to the others, but took a step up to the kirkyard, and there I found him lying close by the laird's grave as if he wass asleep. But he had been there ahl night, and fine I kenned that he wass dead!'

'I wish, Angus, I could be sure that his acquaintances who think themselves vastly superior are as single-hearted as he was.'

'Indeed, sir! and that is the true word! No doubt he had his faults! *Air m'fhalluin!* but whiles I wass prefairin' his company to some of the Christians in the Glen!'

For 'Duke' was a dog, the uncomely descendant of a dachshund and a Cairn terrier, with a big heart under his shabby little coat, and sorry I am to-day that I ever gave him a harsh look or word.

PINCHER MARTIN, O.D.

CHAPTER III.—*continued.*

S. *BEN MACDHUI* certainly deserved all the strictures passed upon her by both officers. She was no chicken, merely a nine-and-a-half knot, pot-bellied monstrosity of a tramp

built in the early 'eighties, which, by inadvertence on somebody's part, or through a shortage of more suitable craft, had temporarily been chartered as an Admiralty collier. She belonged to a small

company who appeared to earn their dividends by buying all the old crocks of ships they could lay their hands upon, and then running them on the cheap, for all her gear and fittings were as elderly and unsafe as herself. Her middle-aged winches wheezed cheerfully, and vomited forth jets of steam, scalding water, and gouty of oil when they could be persuaded to revolve. Her derricks groaned and sagged perilously when they lifted half their proper load; while the less said about her coaling-whips—supposed to be brand-new two-and-a-half-inch steel wire of the best quality—the better. The officers and men were thoroughly in keeping with their ship. The former, according to their own account, had all seen better days; while the latter, bleary-eyed and stiff in the joints, looked more like a party of workhouse inmates than the crew of a British merchant ship. A more decrepit and ancient set of mariners it would be impossible to find. They all had bald heads, several were grandfathers with flowing white whiskers—when they washed; but then, of course, Messrs Catchem & Flintskin preferred men of experience to mere scatter-brained youngsters. They were more reliable, they said; but they also got them cheaper, and their appetites were smaller.

The 'Belligerents' swore lustily when the venerable *Ben Macdhu* secured alongside. The commander shared their feelings; while the first lieutenant—who was in general charge of the collier during coaling—nearly wept, and retired to the wardroom to seek liquid consolation. The lieutenants in charge of the holds, who would have to bear the brunt of the whole business if the coal did not come in at its usual rate, cursed long and loud. They were all justified, poor souls, for a bad collier may mean a long coaling; and a long coaling in the winter is the 'perishin' limit,' as some one put it.

The collier came alongside before dark, and that evening new whips were rove, derricks were rigged and topped, bags and shovels were brought up from the dim recesses of the *Belligerent's* bowels and distributed among the holds, the battleship's deck was brushed over with a moist mixture of sand and lime to prevent the coal-dust from soaking in, and all paintwork on the upper deck was swathed in canvas for the same reason.

Martin, as Lieutenant Tickle has already explained, had nearly lost the number of his mess when assisting in the collier. He thought his narrow escape was deserving of a certain amount of sympathy, but precious little he got. He was bluntly called a '—— young fool,' and asked 'why the —— he wanted to get his —— head in the way.' Even his mess-mates laughed at him, for to all bluejackets a miss is as good as a mile. In the course of their careers, even in time of peace, they look

death in the face so often as to be utterly un-mindful of narrow squeaks. Their calling is essentially a risky one, and to become inured to danger is part and parcel of their training. If a man has a close shave he is chaffed unmercifully; if he is killed, his shipmates express their sympathy, shrug their shoulders, attend the funeral with tears in their eyes and a glass case of wax flowers in their hands, and subscribe their shillings and pennies toward providing for the widow and children. It is all in the day's work.

Punctually at five-thirty the next morning, while it was yet dark, the boatswain's mates were piping, 'Clear lower deck! 'Ands fall in for coaling ship!' and officers and men, clad in the oldest and grimmest of garments, repaired to the quarterdeck. Coaling ship was always a 'clear lower deck' evolution, and nobody except a few privileged officers and men was excused.

On the quarterdeck was the commander; and presently, when the men had been reported present, he gave them a few words.

'Men,' he said, 'we've got a bad collier this time, just about the worst thing in colliers I've ever seen. We have six hundred tons to take in, so let's see if we can't make an evolution of it. We've been a pretty good ship for coaling up to date, remember, so don't let us spoil our good record now. Coal ship!'

The groups of men scattered and fled to their several stations. The forecastlemen, foretopmen, maintopmen, and quarterdeckmen repaired to their respective holds in the collier, where they were divided up into gangs of five for shovelling the coal into the two-hundredweight bags, which were hoisted on board ten at a time. The 'dumping-ground parties,' composed principally of artisan ratings like the carpenter's mates, shipwrights, plumbers, and blacksmiths, were sent to the places on the battleship's deck where the hoists would presently be coming in. Their duty was to unhook and unstrap the bags as they arrived, and to place them on the barrows, which were then trundled to the various bunker-openings in the deck by the Royal Marines. Here the bags were seized by the 'tippers,' and their contents emptied down the shoots into the bunkers below, where they were stowed by the stokers doing duty as 'trimmers.' The empty bags were collected by a number of ordinary seamen and boys, who returned them to the holds in the collier; and woe betide these youths if the men digging in the holds were delayed through a 'shortage of empties!'

Practically all the officers coaled with their men. The commander was in general charge of the whole operation, while the first lieutenant exercised a general supervision in the collier. The lieutenants and midshipmen of divisions worked with their men in the holds; while Vernon Hatherley, the lieutenant-commander (T.), clad in an ancient Panamá hat and a suit

of indescribable overalls, acted the part of traffic manager on the upper deck. He had the assistance of a couple of midshipmen, and among them they organised the movement of barrows between the dumping-grounds and bunker-openings, so that no two streams moving in opposite directions should come into sudden and violent contact, and so cause a congestion in the traffic. The captain of marines, Hannibal Chance, supervised his barrow-men, and, assisted by the sergeant-major, exhorted them when they became languid. Nearly every other officer in the ship, save only the fleet surgeon, fleet paymaster, surgeon, and assistant-paymasters, was in charge of something or other. The lieutenant-commander (N.), Christopher Colomb, otherwise the navigator, kept the 'day on' as officer of the watch; while even the chaplain, the Reverend Stephen Holiman, set an example by shedding his clerical garments and trundling a barrow. The men loved seeing Holy Joe 'sweatin' hisself,' as they put it; but, for all that, they voted him a good fellow, and he was immensely popular on the lower deck.

Martin found himself detailed as a member of one of the gangs of diggers in the forecastle-men's hold. The work of shovelling the coal into bags was back-breaking, for no two consecutive shovelfuls were exactly the same weight; added to which, he found it extremely difficult to keep his footing. The confined space reeked of coal-dust, and before long he and his companions were jet-black from head to foot. He breathed the fine powder down into his lungs. He perspired profusely. His back, shoulders, arms, and thighs ached with the strain; but he was game, and managed to struggle on somehow. Five other gangs were at work besides his own. Each one was responsible for a hoist of ten bags, and had to have them filled and strapped together by the time the whip was ready to hoist them. They occasionally had a few minutes' rest between the hoists, but otherwise the work went on continuously; and it was a point of honour that the whip, which visited all the gangs in rotation, should not be kept waiting. If there was any undue delay in hooking on, there were loud shouts from above, and angry, nautical exhortations from the lieutenant, midshipmen, and petty officers working in the hold.

It was sultry work, very sultry, though it was winter. The dust was so thick that the powerful arc lights could only be seen in a blurred glare across the hold. Jet-black figures whirled in and out of the murky cloud like demons on the brink of the nethermost pit. Shouts of 'Stand from under!' and empty bags came from the deck above; and every now and then there came a shrill screech on a whistle, a frenzied shout of 'Mind your backs! Stand clear!' a frantic clattering from the long-suffering winch, and a hoist would go hurtling, swinging, and banging across the hold as the wire whip strained and

tautened out. The labouring men would spring aside to get clear, for a ton of coal in the small of the back will send a twelve-stone man flying, and may cause him serious injury. But still the work went on without a stop, and hoist after hoist left the hold, disappeared in the darkness above, swung through space, and finally landed with a thud and more shouts on the battleship's deck.

The *Ben Macdhui* was certainly a bad collier. Twice during the first hour did two of her winches break down, and each time they caused a delay of fully twenty minutes. Another time a block on the head of a derrick carried away, and the suspended hoist fell back into the hold with a crash, knocking over two men. They were not seriously hurt, and picked themselves up with many full-blooded sea oaths, to resume their work as if nothing had happened.

The 'Belligerents' prided themselves on their coaling. With a good collier they had been known to average one hundred and seventy-seven tons per hour; but this time they had only embarked one hundred and ninety-eight by eight o'clock, at which time there came half-an-hour's respite for breakfast. They had been at it since about five-forty (two hours twenty minutes), and the commander was not at all pleased. But even he realised that it was not the fault of the men. 'Bad!' he growled. 'Damned bad! We're only averaging eighty-four point eight an hour. What can one do with a collier like this?'

During breakfast-time, wardroom, gunroom, and mess-decks were invaded by hordes of black-faced demons, ravenous and clamouring for food. Some of the more fastidious among them had washed their hands and had cleared a circle of grime from about their mouths; but time was short, and most of them had not troubled to do even this. Officers' messes, cabins, and mess-decks were pervaded with the strange, penetrating smell of coal. The dust hung and lodged everywhere, and even the porridge, eggs and bacon, and milk were covered with films of black powder. But what did it matter? They were hungry, and the food tasted just as good, dust or no dust.

At eight-thirty work was resumed, and the ship's company, rejuvenated by breakfast, set to with redoubled energy. The *Belligerent's* once white deck was covered with black dust, caked by the wheels of the barrows. Officers and men alike were black from head to foot; but still the hoists crashed in, still the barrows flew round the deck, and still the coal went tumbling down the shoots into the bunkers. On the after shelter-deck the hands were doing their share of the work by braying out the latest music-hall songs; but even their strident and not very tuneless efforts could only be heard at intervals in the clatter of the winches and the hollow rumble of the barrows.

The best hour's work was done between ten and eleven, when one hundred and twenty-four tons were taken in, and shortly before noon the full six hundred had been embarked. The bugle sounded the 'Cease firing,' the last hoists of empty bags and shovels came clattering inboard from the collier with throaty cheers from the tired men, and swarms of bluejackets set about lowering the derricks and unrigging the gear.

Soon afterwards, when the *Ben Macdhui's* chief engineer had raised sufficient steam in his tin-pot boiler to revolve the engines, and when the ancient crew could be induced to bestir themselves, the collier let go her wires and waddled off. The 'Belligerents' cheered and waved ironical farewells as she departed. They were heartily glad to see the last of her.

'Gosh!' muttered Martin, with a heartfelt sigh, as he watched her go from the forecastle, 'I ain't sorry that job's done!' His back ached, and he felt very weary. He also wanted his dinner.

Able Seaman Billings heard his remark and smiled. 'Garn!' he jeered good-naturedly; 'this 'ere coalin' ain't bin nothin', only six 'undred ton. You wait till we joins up wi' the fleet, me lad, when we coals once a fortnight regular.'

It was quite true, as Martin afterwards discovered.

That afternoon, armed with the hose, scrubbers, and soap, they set about cleaning the ship, themselves, and their clothes. Coal-dust seemed to be everywhere; it had lodged in every nook and cranny, but by dark most of it was removed and the battleship was looking more or less like her old self. So ended Martin's first experience

of 'coaling ship,' an evolution which subsequently was carried out with such frequency that it became a mere incident.

The next day they took in ammunition and explosives enough to send a whole squadron of Dreadnoughts to the bottom. Innocent-looking lighters and barges, crammed to the hatches with shell for the twelve-inch, six-inch, and smaller guns; cases of cordite-cartridges; boxes containing the copper war-heads for the torpedoes, filled with gun-cotton; small-arm ammunition; gun-cotton charges in cylindrical red-painted cases, and detonators, came alongside in the early morning while it was yet dark.

Soon after eight o'clock the work began. It was preferable to coaling, as it was cleaner; but the labour was very strenuous. There were three lighters on each side, and each had its own party of men employed in hooking on the projectiles and metal cordite-cases, which were then hoisted on board by the battleship's winches. Other men on deck with barrows transported the shell and cases as they arrived to square hatches in different parts of the deck, through which they were lowered to the magazines and shell-rooms in the bowels of the ship, to be stowed in their proper racks, bays, and compartments.

The great eight hundred and fifty pound projectiles for the twelve-inch guns dwarfed all the others, and they were slung inboard singly on account of their weight. The hundred-pound shell for the six-inch guns came in in canvas bags a couple at a time, while the lighter projectiles for the smaller weapons were hoisted in consignments.

(Continued on page 344.)

PARLIAMENTS AND NEWSPAPERS IN TWO HEMISPHERES.

By Sir HENRY LUCY.

DURING a visit to the United States some years ago I had the good fortune to find myself in Washington at the opening of a new session of Congress, whose first appointed work was the election of a Speaker. Looking down on the crowded scene from the Diplomatic Gallery, what struck one long accustomed to procedure in the House of Commons was the prevalent note of simple, severe business intention. At Westminster, election of a new Speaker is marked by a ceremony some of whose formulas go back to Stuart times. If it be not opposed—and it rarely is—it is moved from the Ministerial side by a private member of high personal standing, the resolution being seconded by a member of the Opposition of equal repute. Stately speeches are made, extolling the virtues and capacity of the candidate. Election accomplished, whether

by unanimous vote or after a division, the Leader of the House and the Leader of the Opposition make further high-toned speeches, the latter, though defeated, rivalling the spokesman of the Ministerialists in his courtesy and submission to the new Speaker.

Further ceremony follows. Though elected by the Commons, the call to the Chair is not complete till the name of the new Speaker has been submitted to the sovereign. This is done on the following day, when a solemnly appointed royal commission sits in the House of Lords. Thither, at the appointed hour, the Speaker elect proceeds, and standing at the bar, 'humbly submits' himself for royal approval.

Humility is, of course, only assumed. It is one of those little politenesses of the kind that passed between the barons and King John at

Runnymede. To refuse to confirm the election of the Speaker of the House of Commons would be as much as a king's throne, not to speak of his head, was worth. Yet in this prosaic twentieth century the little comedy is played out with painstaking precision.

Pending royal confirmation of his election, the Speaker is content with wearing what in English legal circles is known as a 'bob-wig,' with braided coat and knee-breeches. As yet the Sergeant-at-Arms, direct representative of the Crown to the House of Commons, does not officially know him. Once royal assent is conveyed, everything is changed. The Speaker, retiring to his private apartments, comes forth arrayed in wig and gown. The Sergeant-at-Arms shoulders his mace and escorts him to the table of the House, both living happily together ever afterward.

Elected by an undisputed majority, the Speaker of Congress, wearing in his coat a red carnation, emblematic of a blameless life, took his seat in the Chair with as little ado as if it were the preliminary of having luncheon spread on the table before him. Not for him the chrysalis state of the Speaker of the House of Commons, since there was no later butterfly condition represented by the full-bottomed wig, the black silk gown, the silken stockings shining over shapely calves between knee-breeches and silver buckles set on Oxford shoes. The dress 'Uncle Joe' Cannon wore when, a private citizen, he went to church on Sundays, he wore in the Chair at Congress, and, subject to careful brushing, would wear it every day he was called upon to perform the lofty duties of Speaker of the House of Representatives. To one who has lived in the House of Commons for forty years, known and revered three of our greatest Speakers, there is something furtively pleasing in hearing the Speaker of the Congress of the United States commonly called 'Uncle Joe.'

I suppose that even in Congress this effulgence of familiarity might be carried too far. If, for example, 'the gentleman from Missouri' (whom I was pained to hear speak disparagingly of 'the gentleman from Ohio') had opened his remarks by addressing the occupant of the Chair as 'Uncle Joe' there would have been some disquiet in the assembly. According to the same severe rule of conduct, when the roll of members was run through in the election of Speaker, no one called out, 'Uncle Joe!' It was 'Cannon!' to right of them, 'Cannon!' to left of them, volleyed and thundered, bringing to the Chair 'Uncle Joe' in triumph over his opponent, who apparently had not yet in public life won the endearment of a pet family appellation.

'Uncle Joe,' having been sworn in, took the Chair as a duck takes to water. At the outset he had a little difficulty with his spectacles. An old parliamentary hand, accustomed to exercise the fluency of public speaking which comes

to Americans by nature, as reading and writing, according to Dogberry, come to us all, he fixed on his nose a pair of glasses that had seen long service while he was still a private member. But they would not work. After a moment's struggle he dived into the recesses of his breast-pocket and fished forth another pair. These apparently bore the Speaker's mark. Anyhow, they served. And in a voice a trifle tremulous he read a dignified little speech, as warmly applauded on the Democratic benches as it was by the Republican majority. With prompt and promising eye to business, the Speaker, having finished his reading, said, in quite another tone, reminiscent of the New York surface carman's 'Step lively!' 'I'm ready to take the oath of office.'

Comparing the assembly with the more familiar one at Westminster, I noted a marked difference in the general physiognomy. The average age of Congressmen is considerably less than that of members of the House of Commons. With us parliamentary life is the goal of long labour in the commercial or professional mart. We have a sprinkling of dukes' sons and the like who come into the Commons because their fathers were there before them. In the main the House of Commons is composed of men over fifty, who have made in other fields of labour their mark and their fortune, and feel they can afford to add to their affluence the stamp 'M.P.', which socially and otherwise is of substantial value in Great Britain. Congressmen mustered at Washington gave an impartial observer the idea that they were at full work outside, and meant to take on Congress merely as an annex to their private business.

Complaint is sometimes made by critics of the House of Commons procedure that time is wasted in the division lobbies. The process, especially when utilised for obstructive purposes, is certainly a little dreary. When, on a question put, a division is challenged, the Speaker cries aloud, 'Strangers will withdraw!' Formerly at this signal the strangers' galleries were cleared. Of late years expulsion has been confined to strangers seated beneath the galleries, actually on the floor of the House. The clerk at the table turns a sand-glass which marks a space of two minutes. Meanwhile electric bells are clanging through every corridor and in every anteroom, and members come in on the trot, fearful of losing a unit in their aggregate of divisions.

The Speaker again putting the question, members pass out into the 'Yea' or 'Nay' lobby according to their convictions, having their names noted and their votes recorded by the exit. The performance occupies seven or eight minutes. But it is complete and conclusive. If by rare chance error in the counting is made by the tellers, it is corrected by the clerk, who, standing at the wicket, checks off the names of members as they pass through.

On the day of my visit to the Capitol there was vote by the roll and vote by counting heads. To a stranger the former was wearisome; the latter seemed slovenly, inviting error. The House of Commons is counted by the Speaker only when doubt is raised as to the presence of a quorum. Holding his peaked cocked hat in his right hand, the Speaker, as he audibly counts, points to each member present, the ultimate figure being forty. This action, though made easy by the comparatively small number to be counted, and dignified by the appanages of cocked hat, wig, and gown, has its ludicrous side.

To see 'Uncle Joe' determinedly clutching his hammer-head while he points its handle individually at some three hundred and fifty fathers of families would be fatally suggestive of the sufferer from insomnia, who from his sleepless pillow tries to count how many supposititious sheep are passing through an imaginary field-gate. Happily the Speaker in Congress is relieved from such contingency.

Since Congress gets to work early in the day, adjourning before dinner, there is no necessity for the elaborate commissariat department which is one of the institutions of the House of Commons. In this respect it resembles the House of Lords, members of which rarely, if ever, dine on the premises. Abstention in this respect is due not to lack of accommodation, but to the simple fact that the business of a sitting is, with perhaps half-a-dozen exceptions in a session, completed before eight o'clock. Nevertheless noble lords have at hand what Lord Halsbury would call 'a sort of' victualling department. There is a noble dining-room and a spacious kitchen furnished with titanic grates and ovens of the last century. With their assistance no difficulty is experienced in cooking a chop or—with due notice, such as is given prior to the introduction of a Home Rule Bill or a measure for the Disestablishment of a Church—a joint of meat. The difficulty is presented under the question, Who is likely to partake of a meal?

Under long-prevailing circumstances, purveying being in private hands, there was some demand for a midday meal in the form of luncheon. The last person expected to be found seated at the table is a peer of the realm. The principal customers are committee clerks, with, it is said, a sprinkling of the outside public, who have discovered that, in addition to august connections, they get a moderately cheap meal in the peers' dining-room. There is talk of this anomalous state of things being done away with. The Home Rule Question and the Welsh Church off their mind, noble lords are at leisure to set their house in order, and begin with the kitchen department. Hence the contemplated appointment of a Supervising Committee.

The last Annual Report of the House of Commons Kitchen Committee was certainly not encouraging to fresh enterprise. On an expenditure of something less than twenty-one thousand pounds, it shows a deficiency of two hundred and eighty-seven pounds eighteen shillings and twopence. What seems a fair profit was realised on the turnover of capital. The sale of provisions, bought in at a cost of ten thousand three hundred and forty-seven pounds nineteen shillings and threepence, yielded a gross profit of one thousand two hundred and ninety-five pounds thirteen shillings and tenpence halfpenny. The mention of what Mr Mantalini deprecated as 'demnition coppers' is reassuring as to the minuteness with which the Kitchen Committee's accounts are kept. Mystery lingers over that odd halfpenny. Its appearance is probably due to expenditure by a county member. But what could he buy, or what could Colonel Mark Lockwood and his colleagues on the Kitchen Committee sell, for a halfpenny? However, there it is. The total receipts in this department amounted to the sum of eleven thousand six hundred and forty-three pounds thirteen shillings and three-halfpence, and there being on the other side of the ledger no expenditure of an equal fraction, there stands the halfpenny to the credit of the year's trading account.

The profit on the sale of wines, spirits, beer, and mineral waters was considerably greater than that forthcoming from provisions. An outlay of three thousand six hundred and ninety-six pounds fourteen shillings and eightpence yielded a gross profit exceeding 50 per cent.—a percentage far exceeding that obtained from any other department. An expenditure of eight hundred and eighty-four pounds on cigars and cigarettes shows a profit of two hundred and forty-three pounds. This aggregates a gain on the trading account of three thousand four hundred and eighty-two pounds fifteen shillings and elevenpence. Standing by itself, as it does in the form of accounts presented by the committee, this is eminently satisfactory. But it tells only half the tale. There are, unfortunately, wages and salaries to be paid, washing to be done. They amount to five thousand seven hundred and seventy pounds fourteen shillings and a penny (another odd copper). In spite of a compassionate subsidy of two thousand pounds per annum contributed by the taxpayer, in addition to members' salary of four hundred pounds a year, there stands forth the deplorable deficit recorded above.

To the business caterer it will probably seem a remarkable, not to say a significant, thing that the Kitchen Committee of the House of Commons annually find themselves in a difficulty about making both ends meet. To begin with, they have exclusive monopoly of feeding over six hundred gentlemen more or less comfortably off, each certainly endowed with an income of not less than

four hundred pounds a year. In addition to the subsidy of two thousand pounds a year (withdrawn in the current session), the committee pay neither rent nor rates, and have free supply of coal, lights, and crockery. These are conditions unknown to the trade outside. They are enough to make the fingers of the managers of certain well-known refreshment establishments itch to have the handling of this concern. Well, not many years ago it was leased to a private firm, who certainly did not make a fortune out of the business, and after prolonged trial gratefully withdrew.

There is one condition dominating the victualling department equally unique with others mentioned. It is the uncertainty which pervades the kitchen, making the grasshopper a burden to the cook and all concerned with the management. On a given day no one can say how long the House will sit. Even at times of political crisis, when the Whips have got together a full muster, an unexpected turn of events may bring about adjournment before the dinner-hour. Nevertheless, dinner must be prepared and a full staff be in attendance. This uncertainty, prevalent in degree at every sitting, is the root of the evil apparent in the Kitchen Committee's annual balance-sheet.

In a well-known essay on a ponderous tome Macaulay began his review by setting forth the measurement and the avoirdupois weight of the volume. Having paid twopence halfpenny for a New York Sunday paper, I was irresistibly impelled to appreciate it in the same form. It weighed two ounces less than a pound and a half. Its ninety-six pages, if spread out in succession, would make a pathway along Fleet Street forty-eight yards long by three-quarters of a yard wide. It was profusely illustrated, three supplements being richly endowed with colour. Divided into sections, it dealt with divers subjects of human interest. The first, consisting of twelve pages (about as much as we expect for a penny in London), was devoted to the latest news, including copious cable despatches from London and Paris. The second was, on the whole, local in its character and in its abounding advertisements. The third section of my Sunday paper was devoted to the interests of Southern readers. The fourth, twelve pages of solid advertisements, dealt with real estate. The fifth treated of finance, horses, and carriages. Finally came the magazine section, sixteen pages, the comic section, and the horse show supplement, each lavishly illustrated, partly in colours.

The difficulty besetting the Britisher is that of finding his way through this labyrinth of print. In an ordinary New York household the paper I studied was merely an item. There were five or six equally prodigious in size lying on the table. They made one's flesh creep by headlines in type two inches long printed in blood-red ink. Complaint has been made of the

thickness of a wood which prevented one seeing the trees. To the untutored eye the headlines in some New York papers are so colossal that it is difficult to find the news. Not infrequently it happens that when found its quality and importance turn out to be wholly inadequate to the size of the heading.

Newspapers are much more part of the daily life of an American than they are with us. In the morning and evening trains which fill and empty New York City, every man, woman, or child is reading a newspaper, in many cases with a second in reserve on the knee. In British hotels newspapers are provided for the common use of the guests. In the States, with few exceptions, man, woman, or child going down to breakfast stops in the hall to buy newspapers from the stand. The price is 50 per cent. higher than that for which the same sheet may be bought in the street outside.

But what is a penny to an American? In dealing with small money his idea does not descend below the nickel, whose nominal value is twopence halfpenny, its actual purchasing power being equal to a penny. On the London streets a man can have his boots polished for a penny. In New York and Washington, if a shoeblack, reviewing the situation, adopts the principle of small profit and quick returns, he makes bold advertisement that he will 'Shine your shoes for five cents.' If one nurtured in the lap of luxury hankers after the sumptuousness of a 'Polish Parlour,' bang goes a dime—*Anglicè*, fivepence.

The usual price of a New York morning paper was some years ago three-halfpence. One morning a leading journal, determined to make things uncomfortable for rivals, came out in undiminished size at the price of a halfpenny. It sells at that rate to-day, and a competitor has come down to the same terms. The paper on which it is printed cannot, at wholesale price, cost less than a halfpenny. If, as seems probable, the cost is the smallest fraction in excess of a halfpenny, the loss must be considerable, since one of the journals in question is credibly reported to consume one hundred and ninety tons of paper per day!

The leading New York Sunday papers spread all over the States, in due time reaching the uttermost ends of a continent whose shores are girdled by two oceans. But every town of moderate size, in addition to several morning papers, has its Sunday papers, more or less successfully mimicking the enterprise of the giants in New York.

In general character and point of view a popular American daily and its staidier British contemporary are wide as the poles asunder. The American is morbidly feminine in his curiosity about the private doings of his neighbours. This passion his favourite journal spares neither money nor labour in ministering to.

Interviewing prominent people, whether citizens or visitors, is a practice of late years grafted on British journalism. The American papers have worked it into the position of an exact science. Personalities which a British journal, if it printed them at all, would present in bald paragraph form, are in a New York paper extended over a column by means of hysterical headlines. Space is obtained by the sacrifice of reports of parliamentary proceedings, of the speeches of public men, of law-reports, and of other weighty matters in which the austere heart of the British sub-editor delights.

British journalists are occasionally inclined, with pharisaical pride, to plume themselves on keeping their papers clear of the sort of journalistic free lunch, served with strong drink, at the bars of what are called 'the yellow journals.' There is, however, one respect in which the standard of purity is higher in New York than it is in London. In *causes célèbres* involving charges of immorality, while the most reputable British journals give full reports, some, in fact, supplying a record almost verbatim, the yellowest of New York journals, so far from following that course, studiously omits from its narrative of current events reference to matters not talked about in the presence of ladies. Short of that, it will with frenzied haste and fervid imagination (the latter not infrequently supplying the facts) work up the details of personal and private matters its London contemporaries would not even barely record. One day during my visit a rumour ran through New York that a scion of a millionaire family had been married to, or was about to marry, a restaurant waitress. The tit-bit was

the more tasty since a near kinswoman of the alleged bridegroom was about to endow an English dukedom with her boundless worldly goods. The prospect of the noble duke finding himself party to a double family wedding, the other bride being an ex-assistant in a ham-and-beef shop, was exceptionally attractive. Calling late in the afternoon at the office of a great New York daily, I found the city editor (he has nothing to do with finance) in a state approaching coma. He was exhausted but triumphant. It was noon when the rumour reached him. Now, it being four o'clock, he handed me with pardonable pride a copy of a special edition of the paper enriched with photographs of the father of the ham-and-beef girl and of the priest who was alleged to have been approached on the subject of the marriage ceremony. In spite of diligent search the bride elect and the expectant bridegroom had not been found, but their portraits were given, and, by way of pendant, those of the noble duke and his bride soon to be cousins by marriage of the ham-and-beef girl. The story was expanded to a page, and sold like wildfire.

It turned out to be a hoax. An impostor, assuming the name of the millionaire, had proposed to the ham-and-beef girl, handing her, as appears to be the genial habit of millionaires in such circumstances, a little cheque for a hundred thousand dollars. But what would you? Next afternoon there was another special edition of the evening paper, with more portraits showing how the thing had been done, and recounting the adventures of a staff of amateur detectives on the track of the fugitive personator of the outraged millionaire.

GOLD IN WAITING.

CHAPTER IV.—*continued.*

EBENEZER had no key, and he knew Martha well enough to be sure the house was locked and bolted and barred against all entrance. Still, he must have fire and food and a bed prepared for him. And the old servant must at least sleep there. Fearless otherwise, the young man had an uncanny dread of the bones his grandfather had uncovered.

To call at Coatmayes Farm himself was out of the question. He must find a messenger. He looked up and down the empty street. Presently a big lad came along, a lantern swinging in his hand.

'Say, cully,' called out Ebenezer in his rough way, 'do you want to earn a crown?'

'Put me to it, Master Fancit,' cried the boy.

'Then go to Coatmayes Farm,' said Ebenezer, 'and tell Mistress Martha Ginnett that Mr Fancit is home.'

'Doubt if I can cross the brook, master,' objected the boy, 'but I'll lug along and see.'

'Go you,' said Fancit, 'and put a speedy foot out. Meanwhile, give me your light, because I must get into my house by some means.'

Lantern in hand, Ebenezer went into the yard. Old Martha probably did not know of that loose bar on the scullery window, but Ebenezer had used it scores of times as a boy. The bar was still loose. Having a thought for his beast, he put her in her stable and gave her a feed, promising himself he would bed her down later; and then, with much struggling and swearing, he managed to insinuate his not very stout body through the narrow window-frame, and was home again.

A fire was laid in the parlour; he lit it, and then his thoughts turned to a restorative. But to obtain that he must go down into the cellar, which was a task abhorrent to him at any time.

However, his thirst overcoming his qualms, he seized the lantern and strode down into the depths. Hastily gripping a bottle of wine, he fairly flew up the narrow flight of stairs. A crack, and the neck was off the bottle, and the wine flowing into a tankard.

'Well, a merry Christmas to all of us!' cried he mockingly.

The wine was very soon finished. Lighting a long clay pipe, he sprawled on the couch. It would be some time yet before the old servant could be back. He felt half-inclined to step up to the 'Quart Pot,' and perhaps would have done so had he been in any mood for company; but just now he preferred his own. He felt he could not crack jokes with the rough yokels.

A half-hour passed. It seemed time for another bottle.

Laying down his pipe, Ebenezer rose, took up the lantern, and, a little unsteadily, went out into the passage. After this he would keep his wine above-stairs. He would have done so before had it not seemed an old-maidish thing to do—to keep wine in the sitting-room. A cellar was the place for that. A cellar—yes. But there were cellars and cellars.

Heavens! how the silence and gloom of the house oppressed him!

He brought another bottle up, and had soon finished it. Still the old woman did not come. Besides, the boy should have been back to say she was on the road. Some one had called the lout in to give him a Christmas tart. He had been laggard on his way. A crown! He should have a kick as well. How cold and silent the house seemed—like a tomb! Fancit ran his fingers through his lank black hair and stared about affrightedly. He must have another bottle. There was nothing like it to keep off these fancies. Fancies! Were they fancies? For he felt that there were people about him, and that skinny hands were trying to seize him and bear him away. With a whole volley of oaths he took up the lantern, and again descended into the cellar. *What was that?* A grisly, bony figure seemed to be beckoning to him, a figure of immense height. With a scream, Ebenezer flung the lantern at the apparition and fled wildly up the cellar stairs. Twice he slipped, bruising himself, but he took no notice of his hurts. He tore at the locks and bolts of the back-door, and passing out into the yard, splashed across to the stable, where his horse stood patiently awaiting his attentions.

'I will fetch the lazy old body myself,' exclaimed the frenzied man. 'Ay, and I'll steal a look at the boy. Alice, she can scratch me if she likes, the jade! I will have a look at the boy. They sha'n't deny me that. Who dares keep a man from his own son?'

He sprang into the saddle and rode out into the street. Lights gleamed through many

shutters, but not a soul was in view. Quite a lot of light came through the shutters of Master Perriker's parlour. Ay, the soapy barber would be keeping Christmas with his cronies, those tight-lipped men who knew what was what when they were buying a bit of land. Would he had what was in their pouches! Solid men they were, those three little men; solid, saving little fellows. And they had got all he had.

He plunged his spurs into his horse's flanks, and the beast tore down the hill. The lights of the modest homes flashed by them. Ebenezer was going to see his son. Ay, and he would snatch a kiss from his red-haired lass—he was in a mood to do that; he was in a fine, merry mood that dared anything. How she would spit at him—the cat! Never mind. A look at the boy, a last taste of his wife's lips, and then he'd sell his old house to the three little men and be gone. This place should know him no more.

Splash! He was in the brook. The horse stumbled, made a gallant effort to recover herself, but went down again, flinging her rider from the saddle. Relieved of his weight, she found herself, and struggled back to the road. She gave a shrill neigh of alarm, for she could see nothing of her master, only the pale moonlight resting on the troubled waters. But as the faithful animal stood there irresolute a cry broke the stillness.

A hooded, cloaked woman, approaching the bridge from the opposite side, stood still and gazed at the empty saddle. The mare, upset by this double fright, turned tail and galloped off. Then Alice Fancit—for it was she—set foot on the bridge. But the water was roaring round its supports; it cracked beneath her. She stopped, and drew in her breath sharply. She had a lantern, and by its light she could see a hand clinging to a plank in the bridge. She had recognised the horse. It was Ebenezer's.

The beams of the flickering lantern, the clouds driving over the moon, the swirl of the waters, the receding hoof-beats of the terrified horse, and the thunder of her own heart, all set her in a whirl. But there was that hand, that white hand clinging. She bent down and seized the wrist with both of her hands, and as she did so the bridge fell away beside her, before and behind, leaving her on two shattered fragments of footboard. But she saw a face raised, a face that looked into her own.

'Alice!'

Was she ever to forget that haggard face, the look of unutterable weariness and hopelessness in the once handsome eyes?

'Yes, it is I, Benny!' It was her play-name for him, used but little since their courting days. 'I am holding you. It is I, Benny. Keep up, dearest one. I was coming to fetch you.'

Suddenly the man was himself again. The shock of the icy water had sobered him. His brain was clear. He felt the great strength of

the waters round him. He saw the planks on which she knelt bending; he heard them cracking. He was a strong man, and with her help could have drawn himself into safety; but the little bridge was shattered, and at any moment the tiny portion on which she knelt might be swept away. Certainly it would not bear the double weight.

'Alice,' he gasped, 'let go, or you will be drowned.'

'No; I am holding you,' she said. 'The horse has gone; somebody will see her; there will be help in a minute. Keep up, Benny.'

But the fragment of bridge was cracking.

'It won't hold us both, girl.'

'Hold on, Benny!' she cried piteously. 'You must live. Oh Benny, you will love the boy!'

'My love, Alice!' he said hoarsely. 'I am no good; let me go.'

'Hold on!' she screamed.

He looked at her out of his miserable eyes, and yet there was something of joy in them. It was one of those heavenly moments that are vouchsafed to a man, even to such a man as this. He read love in her eyes, she love in his. With an absolutely clear mind he saw her peril, and with a last look he dragged his hand away, and was swept along the stream.

(Continued on page 340.)

AN INCIDENT IN THE GREATEST MASSACRE OF MODERN TIMES.

By NIMROD.

AMONGST its side issues, the war has brought into prominence the country of Armenia, a province of the Turkish Empire which has suffered many vicissitudes at the hands of various Sultans who have occupied the Ottoman throne. The Armenians are fair in complexion, and a pleasant race of people who give one the impression of being an industrious and well-ordered community. Before the war they not only inhabited Armenia, but large colonies of them had settled in other parts of the Turkish Empire. They are of the Christian faith, and it is partly due to this, and partly to the fact that they are more industrious and energetic than the Turks, that they have suffered so much under Turkish rule. With the entry of Turkey into the present war there also came a new period of tyranny and oppression for this long-suffering race, culminating in what has been aptly described as the greatest massacre of modern times.

At Port Said, by the entrance to the Suez Canal, is a refugee camp numbering over four thousand Armenians, the survivors of one of the recent massacres carried out with such relentless energy by the Turks in the later months of last year. It is with the trials and hardships endured by these unfortunate people that we are concerned in this article; and the recital of their flight and resistance in the mountains, and subsequent rescue by French and British ships when almost at the end of their resources, forms one of the most interesting pages in modern history.

It was early in the spring of 1915 that the Turkish attitude towards the Armenians was such as clearly to indicate that they had determined on the practical extermination of the race. Zeitoun, a town in Asia Minor which was the home of some thousands of Armenians, lies in the Taurus Mountains, on the pine-clad slopes of which are many villages bearing an aspect of peace and pros-

perity such as becomes this fertile and picturesque land. At first various charges were made against the Armenians, and contributions levied on the slightest prettexts. Turkish troops to the number of several thousands were moved into the town of Zeitoun, and attempts to carry the monastery, the principal stronghold, by storm met with a severe check. The leading inhabitants and elders of the town were then summoned to the Turkish headquarters, ostensibly for a conference. There they were seized and thrown into prison, whilst their families were also brought in. This procedure was repeated a few days later, and all were removed to an unknown destination.

At last, when several hundred families had been despatched by devious and unknown routes through the mountains, the people became thoroughly alarmed, and roused to a sense of the dangers confronting them; and, realising the stern fact that their very existence as a community was at stake, they determined on flight whilst there was yet time to save the remnant of their people. The Turks had issued an order of banishment, and the time limit, within which all were directed to be ready to set out on the journey to their unknown place of exile, was fixed at seven days. The night following the day on which the order was received was spent by the leading men in anxious consultation as to the best means to adopt to meet the sinister danger overhanging this gallant and chivalrous band, whose only crime was that they were Christians, and therefore an undesirable element in the Turkish realm. Some amongst the community counselled surrender and compliance with the demands of the Turks, arguing that escape was impossible, that they were hemmed in on all sides, and that any attempt to evade their tormentors must inevitably end in swift and terrible retribution. Others urged a withdrawal to the mountains,

there to hold out until relief should reach them, albeit they knew not how or whence it could arrive. All night long the meeting lasted, but a decision could not be come to, for the delegates were not of the same mind, and even the prospect of being driven into the wilderness and left to the tender mercies of fanatical Arab tribesmen and the savage Kurds could not induce a portion of the assembly to take drastic measures. Finally there was a split in the camp, part deciding on acquiescence to the Turkish orders, whilst the remainder determined to withdraw to the heights of the Musa Dagh Mountains, and hold out as long as supplies and ammunition lasted. They also relied for deliverance on the operations in the Dardanelles, by which if successful, the Turks would be drawn off. Only six days were now left for preparation, and within that period they must be well into the mountains with all their supplies, and entrenched so as to resist the onslaught which would be made upon them the instant their flight was discovered. Included among the fugitives were some fourteen hundred children, about fifteen hundred girls and women, and just over a thousand men. In all, about four hundred modern rifles, flint-locks, and horse-pistols were collected, and thus about half the total number of men were provided with arms of a nondescript pattern. Taking with them all available food, and having sent flocks of sheep and goats into the hills, the little army set out, and by nightfall on the third day they reached the more difficult eyries and crags in the mountains, where a strong resistance could be offered. No time was lost in preparing the position chosen, and ere dawn had broken all were busy digging trenches and fortifying the strategic points and the lines by which the position could be approached. Amongst other things, a committee of defence had been elected and entrusted with the task of evolving a scheme of operations to be put into execution.

Five days had now elapsed since the flight had taken place, and on the morning of the sixth day the advance guard of the Turkish pursuing force appeared in the foothills. They reckoned on an easy victory, and attacked at once; but the Armenians stood their ground well, and the Turks were driven back, retiring to their main body some distance in rear. That night heavy rain set in; and, ill-provided as the fugitives were, and being without shelter or tents, the younger and weaker elements suffered severely for the next few days.

In the meantime the Turks had been completing preparations for an attack on a more extensive scale, and to aid them in their operations they brought up two field-guns and commenced shelling the Armenian position. This wrought havoc in the lines; and eventually volunteers were called for to creep down the mountain-side and endeavour to silence the guns,

either by picking off the gunners or rendering the gun positions untenable, and thus force the teams to withdraw. A young Armenian, who was a good shot, undertook the dangerous task, and under cover of the brushwood he crept down the mountain-side, threading his way through the rocks until he reached a vantage-point from which he commanded a view of the guns drawn up on some flat ground ahead of him. So close was his proximity that he could hear the Turkish soldiers talking, and was able to discern clearly the figures of the men as they moved about. Having constructed for himself an ambush of rocks and branches, he lay in wait, and, never allowing an opportunity to pass, picked off a number of the gunners, accounting for four of them in five shots. This so disconcerted the Turks that the guns were withdrawn to a place of safety, and thus the menace was, to a large extent, removed through the courage of the young fellow, who is still with the refugees at their camp in Egypt.

The Turks now began to realise that in order to achieve success they must embark on larger and more extended measures. They therefore issued a call to the Moslem tribes in the surrounding country to take up arms and exterminate the Armenians, a summons the former would only too readily obey, not only from the prospects of plunder attaching to the work, but also from its religious aspect. These fanatical hordes were supplied with arms and ammunition, and turned loose to aid in the work of destruction; whilst, in addition, a force of several thousand regulars was sent forward. Every line of approach to the besieged Armenians was blocked by the Turks, and by weight of numbers they succeeded in gaining the cliffs along the crest-line. Unfortunately the Armenian reserve was frittered away at these various points in attempts to hold up the Turkish advance, and when this became apparent to the enemy they launched a massed assault through the main ravine, the remainder of the attacks being purely local, and intended only as feints.

Instinctively realising the situation, the Armenians endeavoured to rally, but suffered heavily in doing so. By this time the Turks were in possession of the high ground, and were threatening the camp; and in the late afternoon a decided superiority had been attained over the besieged. Moreover, the range of the Turkish weapons placed the nondescript assortment of arms at the disposal of the Armenians at a hopeless disadvantage. By nightfall the Turks had gained all the ground within four hundred yards of the camp, and only a deep ravine lay between them and their objective. Rather than risk a farther advance in the darkness, they decided to bivouac for the night, and resume operations the next day. This proved the salvation of the Armenians, and, as a result of a hurried council of war, they determined on a

bold and desperate plan. They knew that a crisis in their fortunes had been reached, and it called for uncommonly desperate measures. It was resolved to creep round the Turkish position in the dead of night, and, having out-flanked them, to fall upon the unsuspecting foe, trusting to a fusillade and a hand-to-hand encounter to put them to flight. Taking full advantage of their knowledge of the crags and thickets, they succeeded in carrying out the preliminary phases of the scheme without detection; and then, at a prearranged signal, a volley or two were fired into the Turks, and the attack launched, accompanied by yells and cries, which added to the confusion and alarm in the Turkish camp. The latter was thrown into the greatest disorder, and in the darkness troops were dashing hither and thither, blundering over rocks and bushes, and firing into each other in their dismay. Soon the alarm developed into a rout, and the Turkish forces cleared out of the wood, and, abandoning the positions they had won, fell back some considerable distance to the lower line of foothills.

In this bold attack the enemy lost over two hundred killed, besides leaving behind them a large number of rifles and quantities of ammunition, of which the Armenians stood in such dire need. The tension had now been relieved somewhat, and the besieged force could briefly review the situation and decide on fresh measures to contribute to their ultimate rescue. It was not to be expected that the Turks would leave them alone; on the contrary, they proceeded to rouse up the remainder of the fanatical Moslem population in all the surrounding country; and, being thus reinforced to the extent of a further eight thousand men, they laid siege to the Armenian stronghold on all sides except that opening on to the sea. The idea was to starve them out, a scheme that could not fail in its object within a comparatively short period, for supplies were now running short, and the camp had already been put on half-rations.

A new plan of salvation had to be evolved, and the idea of escape by the sea presented itself. In the meantime a volunteer had crept through the Turkish lines in the hope of reaching Aleppo, eighty-five miles away, and there securing help; but it is doubtful if the runner ever succeeded in gaining his destination, for all trace of him was lost. The Turks carried out several attacks on the position, but each time were beaten back; whilst the Armenians collected rocks and boulders, which they rolled down on the enemy. An anxious watch was kept to seaward for any signs indicating the approach of ships. Five weeks had now passed, and still the remnants held on, despite the numerous attacks upon them and the straits to which they were reduced. On the morning of the thirty-sixth day, when rations had almost run

out, and sickness, wounds, scanty nourishment, and exposure had brought the besieged well-nigh to the end of their tether, a ship was sighted in the distance, and a large Red Cross flag was run up to attract her attention. As she drew nearer inshore the vessel proved to be a French cruiser. A boat was lowered, and came to take off a delegation of the Armenians, who related their plight and all they had undergone. Wireless messages were then flashed across the sea, and soon three other French warships appeared, together with a British cruiser.

The question now arose as to how the large number of refugees could be embarked. The shores of the Mediterranean along the coast of Asia Minor being long and sloping, and noted for the surf and breakers which form so conspicuous a feature, it was not possible to bring boats in, so rafts had to be improvised from wreckage and sundry logs lying along the shore. A couple of rough rafts were put together and poled out through the surf, whence they were taken in tow and the occupants transhipped to the boats in waiting. Despite the difficulties and dangers involved in taking out such a large number of young children and old and infirm people, the embarkation was finally accomplished without a hitch. The guns of the warships covered the operation and prevented interference on the part of the Turks, who, seeing the change in the situation, drew off, as they could effect nothing whatever in the face of such a combination.

Two days later the remnant of this long-suffering people were landed at Port Said, and accommodated in a camp specially constructed for them by the British Government.

The plan and general administration of this camp are worthy of note. It is divided into blocks, each block having a distinguishing letter. Broad roads run between the divisions, and there is ample space round each tent. The tents are mostly Egyptian bell-tents, with a certain number said to have been taken from the Turks in the fighting along the Suez Canal early last year. In the centre of the camp a space is marked off as a distributing-point for the daily issue of rations. Each block of tents has a square, subdivided into smaller squares to correspond with the actual number of tents in the block, and fenced off with little wooden railings. Twice daily the rations for each tent are placed in their respective squares, and are later taken away by the recipients.

Amongst the refugees are upwards of twelve hundred little children, and these, through the philanthropy of an American gentleman who has interested himself in their welfare, are provided with a special ration of bread daily on leaving the schools which have been established in the camp for their education. It is a pathetic sight to watch the little mites as they form up in long lines to file past the baskets containing

the bread; and as one views the scene one wonders how they have managed to survive the horrors of the great massacre and all the hardships involved in the flight from their native land.

In order to give occupation to the men, and to develop their martial qualities, drill instructors from the French warships lying in harbour at Port Said have been lent, and drills are carried out daily. The Armenians are naturally keen to recover their lost possessions and enter once more into their own, and to this end they express a keen desire to arm and train with a view ultimately to taking the field against the common enemy.

The other industries in the camp are lacework-making and cloth-weaving, both from silk and cotton, at which the Armenian women are adepts. A school has been formed where all the women and girls who are exponents of the art attend, and a large number of articles are turned out, which realise a good profit and contribute to the financial resources of the refugees. For the medical care of the camp a hospital has been formed, and a number of Red Cross Sisters minister to the needs of the patients, of whom there are many still suffering from the privations endured before reaching Port Said.

One of the most interesting relics in the camp is the large Red Cross flag made by the sister of one of the leading men. This flag was hoisted on a tall tree during the siege, and was the first signal seen by the French warship far out at sea. Indeed it may be said that the flag in question was the means by which over four thousand people were rescued from a fate overhanging them beside which all

previous outrages would have paled into insignificance.

There is little more to add to the record of barbarism and torture which they have undergone at the hands of the Turks—a policy of annihilation which the latter have applied to Armenia with ever-increasing severity since the day when Gladstone, speaking of the Armenian massacres, characterised the Sultan as the 'Great Assassin.' Under the pretext of dispersing them and checking a phantom rebellion, these unfortunate people have been expelled from their native land, their houses burned to the ground, their gardens and vineyards destroyed, the men and elderly women killed, and the young and prepossessing girls distributed amongst the Turks.

Of those who had given in to the enemy nothing remains to be told beyond a tale of unspeakable cruelties. Whole families, composed of little children side by side with aged grandparents, were driven along the road, deprived of any form of sustenance, and beaten and done to death when they fell by the wayside. Here was a case of the survival of the fittest, for only the very strongest could stand the whips of their guards, the lack of food and water, and the ravages of malaria which now overtook them. A more tragic picture cannot be imagined; and as a closing act of this dark and foul crime, the Turks and Arabs massacred all the males, and distributed the women and girls amongst the tribes.

And here we will take leave of this Armenian community. Some day they may be enabled to return to their own land under new and happier auspices, safe from the tyranny and oppression which have so long been their lot.

REAL VIOLIN ROMANCES.

By WILLIAM C. HONEYMAN, Author of *The Violin: How to Master It*, &c.

ERNST'S STRADIVARIUS.

THREE wealthy musical enthusiasts were once discussing the merits of Madame Norman-Neruda, when one of them chanced to remark that it was a pity that she had not a violin worthy of her powers.

'Ernst's violin is for sale,' said another. 'Suppose we were to buy it for her?'

'Agreed!' was the swift response, and the famous Stradivarius with which Ernst had moved so many hearts was bought for seven hundred pounds, and presented to this greatest of all women players, one of the generous donors being the prince who afterwards became that most popular and tactful of monarchs, Edward VII.

A romantic incident enough in itself, and bringing a lifelong thrill of joy to the lucky artiste; but there was a deeper romance hanging round that wonderful violin.

When Ernst was quite a young man, and playing upon a much poorer violin than that with which Neruda had been presented, he fell in love with a young girl, beautiful, pure, and devoted to him, and would have married her; but her father sternly intervened.

'I like you,' he said not unkindly. 'You are worthy, and you play the violin divinely; but you are a nobody. Go away; travel into other countries, as Paganini did; make a name; then come back here and you shall have my daughter.'

There were tears and protests, of course; but Ernst had to obey, because marriage in that country without a father's consent was impossible. He went away, and travelled to all the great cities of Europe, and proved himself in some respects superior even to Paganini. He secured that wonderful Cremona violin, and with it thrilled the world with his impassioned playing.

In his hands it was not a mere instrument; it seemed a human soul, pouring forth a strange tale of woe and hope and eternal joy. The world rose at him; and with their wild plaudits ringing in his ears, and his Stradivarius in the coach beside him, he after some years presented himself before the father of his fair Mädchen.

Something in the expression of the father's eyes chilled his heart.

'Come here,' said the father; and Ernst, unable to utter a word, followed him to a room above, where lay a coffin covered with white flowers. 'She is dead, but she loved you to the end,' breathed the broken-hearted father. 'I wish I had not sent you away.'

The two men clasped hands and parted, and Ernst composed on his violin that tender and pathetic *Elégie* which will tell his sad romance as long as violin-players and the world exist. It is a song without words, in the minor key, which begins like a whisper out of the land of dreams, with an accompaniment which marches along grim and inexorable as fate; then it merges into the brighter major key, and becomes an impassioned duet; and finally leaves the soprano singing alone, gliding upwards and upwards till it dies away on the harmonic E, clearly representing the wafting of a pure soul up into heaven. Of the violin on which this romance was composed Haweis wrote: 'Here, too, was formed that wondrous violin which in the hands of Ernst, and never since, drew tears and laughter from enchanted multitudes, until it was difficult to believe that the spirits of the dead were not employing its pathetic vibrations to convey to mortals the expression of their infinite longings and ineffable aspirations. . . . Great, deep-souled, weird magician of the Cremona! I can see thy pale, gaunt face even now! Thy Cremona should have been buried with thee. I see it every season in the concert-room; Madame Norman-Neruda plays it. I know she is an admirable artiste. I do not hear thy Cremona; its voice has gone out with thee; its soul has passed with thine.'

A STRADIVARIUS VIOLONCELLO.

SO NEAR, AND YET SO FAR!

A piano-tuner, who was also a dealer in violins, and whom I may name Rossetti, was visiting a mansion not far from Edinburgh, when the lady of the house said to him, 'Mr Rossetti, there's a bass fiddle up in the lumber-room which has been in our family for more than a hundred years. It is what they call a Cremona, and is said to be worth a good deal of money. Now, I am needing a new carpet for my drawing-room, and I want two hundred pounds. If you like, you can have the Cremona for that sum.'

Rossetti smiled, but politely said nothing. He had been offered such valuable fiddles before, and always found them worthless. After finishing his work at the piano, however, he climbed

to the loft, and after much hunting found a violoncello wrapped in a deerskin. Bringing it forward to the light, he uttered a cry of amazement. He scanned it all over, examined the label, gloated over the fine red varnish, and then sat down on an old trunk, or, rather, dropped down in sheer excitement, his legs refusing to support him longer. There could be no doubt about it, he held before him one of the finest specimens of the work of Antonio Stradivari which he had ever seen, almost perfect as when it was made, and worth anything above two thousand pounds. Would he give two hundred pounds for it? Ay would he; on the spot if he had it. He was not a rich man; he had not two hundred pounds or even one hundred pounds, nor was he able to command credit to any great extent.

He was almost sick with excitement; but he carefully put back the violoncello, and descended to inform the lady of the house that he would buy the fiddle as soon as he could scrape together the money. For days and weeks he worried over the problem of that bargain; but though he explained to his friends that he knew where such a prize was to be got, he could not get them to believe him or to lend him the money on however advantageous terms.

Months passed away, and he again visited that mansion, did the piano-tuning, and had another longing look at the violoncello. He also assured its owner that he would buy it soon, though secretly he did not know how that was to be done.

A week later, however, in some magical way, he got hold of the required two hundred pounds, and flew on the wings of the wind to that old mansion, there to spread out the notes before the lady.

'I am very sorry, Mr Rossetti,' she said; 'but the bass fiddle is away. My two nieces were here from the Isle of Wight, and while they were rummaging through the loft they came upon the fiddle, brought it down, and played upon it beautifully, and so begged and pleaded that I let them have it as a present. They're darling girls, so what could I do?'

Rossetti slowly wiped the sweat from his brow, gathered up the notes, and said with absolute truthfulness that he also was very sorry. His fevered dream was o'er. 'Oh, Mr Hone-e-man,' he said to me when sitting at my fireside relating these facts, 'what a feedle that was! And I was so near getting it! I was heart-broken!'

JOHN BETTS'S BARGAIN.

One afternoon in October 1822 a poor man in Birdcage Walk, London, said to his wife, 'Well, that's the last of Lingo Louie,' alluding to a poor Italian who had been their lodger, but who had that day been given a pauper's funeral. 'How much did he owe you when he died?'

The wife consulted the curious jottings which she had made on some scraps of paper, and then answered, 'For grub, fifteen shillings and a penny; rent, four shillings and sixpence—nineteen shillings and sevenpence altogether.'

'Humph! you were a fool to trust him so much,' grunted the husband.

'But he looked so hungry sometimes,' said the wife; 'and there weren't often foreign cases at the police court, so that he could get paid for telling them what they were saying. I don't know how he managed to live.'

'And now he has left nothing but some pawn-tickets and that old fiddle. Women are always soft!' observed the husband with a superior air.

'Well, the fiddle is worth something,' returned the wife. 'He always got five shillings on it at the pawnbroker's, so it must be a good one.'

'It's too new,' said the husband, critically eyeing the fiddle hanging on the wall. 'The black, dirty ones full of cracks are best; and it's got no fiddlestick. Nobody will buy it without a fiddlestick. And then one of the strings is broken.'

'Oh, well, the man who buys it may not notice that,' said the wife. 'It will surely bring a pound.'

'A pound! We'll be lucky if we get ten shillings for it,' said the man. 'Where shall I go with it?'

'Well, I thought you might try that shop under the Royal Exchange. John Betts is the name, and he makes and mends fiddles, so he'll likely buy some too.'

The husband, though affecting to scout this business-like proposition, adopted it; and wrapping the violin in an old handkerchief, he put it under his coat, and about dusk appeared in the shop of John Betts, who was then sixty-seven years old, and a good judge of violins.

'I want to sell a fiddle,' said the man, taking off the handkerchief.

'Oh, indeed!' said Betts, carelessly glancing at the violin, and, noticing its fresh appearance, setting it down as a cheap German copy. 'And how much do you want for it?'

'A pound; it's worth that surely?' said the seller doubtfully.

Then Betts began to look more closely into the violin, while his heart gave a great throb. 'It's Italian,' he thought, 'and by a master-hand.' Then to the seller he said, 'Is it your own?'

'Oh yes; got it for a bad debt,' was the quick reply. 'That's why I can't take less than a pound for it. Isn't it worth twenty shillings?'

The reply of John Betts was to count down twenty shillings to the man, who gathered up the money and hurried out of the shop, saying to himself, 'Well, I am lucky!'

Then Betts took the violin into his back-shop, lighted a lamp, and had a long and earnest look

at his purchase. His judgment had not been at fault; the violin was not only by Stradivari, but the best-preserved specimen of that maker's work which he had ever seen. The varnish was as fresh as on the day it was put on, and very little worn—a little on the breast under the chin, and a little at the centre of the back; the label, dated 1704, was as clean and perfect as if it had been printed the day before; the neck had never been altered; and the original bass bar was still inside, thus proving that the violin had never been opened since it was made.

Betts gazed at the violin for an hour on end, and then sighed out, 'Well, I am lucky!'

That wonderful violin remained in the hands of the Betts family for many years, though they were offered six hundred pounds for it; but at length it was sold to J. B. Vuillaume of Paris for eight hundred guineas. Since then it has changed hands several times, the last price it brought being two thousand pounds.

TO A DEWDROP.

O little drop! O gem of dew!
A wondrous journey thine, and few
Can plumb the depths or span the range
That thou hast known in many a change.

For, bedded by a frozen shore
In massive berg by fairy lore,
Fast bound in icy manacles—
Thou crown of glittering pinnacles!—

Waiting the sun's enchanting ray
To loose the spell at dawn of day;
Then, upward soaring, lightly shroud
A mountain peak, and, lo! a cloud,

Serenely floating, merge and change
From dragon's head to mountain range;
And, slowly sailing, gently shade
A desert parched, a panting glade.

The north wind cools thee yet again,
A myriad pattering drops of rain
Refresh the earth, collect and flow,
That all may live and lovelier grow.

The rushing mountain torrents call
To thee as thou dost leap the fall,
To wander in a valley wide
Or through a lofty cavern glide,

Exploring far the hidden deep
Of Mother Earth, and upward creep
Into the bosom of the sea,
To meet another change for thee.

Again the sun's fair magic wand
Dissolves the spell of water's bond;
And fairy light shall free the chain,
A breeze shall blow thee home again;

Till, wandering softly through the night,
On many a blade of grass alight,
And many a fainting life renew,
O diamond bright! O drop of dew!

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

YOU may mourn for the million; its dignity has gone. Without the awe and mystery that enveloped it as a zone of protective ether, the million is, like any other mere set of figures, easily comprehensible to a fairly mathematical mind. And now the grand mystery is dissolved, and another of the lofty idols of our youth is gone; the cataclysm of these painful modern times has shattered it to dust. At the onset of the armies the godlike million came to be mortal, very common, and even thoroughly practical. The million is now even vulgar. Soldiers are in many millions, yet we can measure their numbers easily in our minds. Money and means are daily reckoned in millions by the people at large. You and I, we all, have been spending our collective five millions per day for the maintenance of an ideal; and when by the chances of the strife at sea an extra three or four millions are lost, it is sad enough in the human way, but in the daily reckoning of the gold it is a little thing, undisturbing. How pathetic is the depreciation of the millionaire! He is but one of us; his imagined might has been exposed, his few millions are such puny things! Perhaps when he and his kind could exert the full force of their old pretensions they could make a war, but now they cannot stop one, and it is that which matters most. Five of his genus, as one might say, are used up between two settings of the sun. Indeed, the millionaire must have our pity, and we shall gather him to a full fraternity with us; he had thought himself rich, and now he is merely poor. He bears humiliation of which he is not the cause. Millions of any kind are a bagatelle. When we were told that out of the fifty-five million square miles of land on the surface of the earth well over thirty were involved in war, and that about a thousand millions of the sixteen hundred millions of people on that land were fighting or helping to fight, did we not, with the aid of a few little paper flags stuck in a sixpenny map, understand precisely? A reckoning was made some while since that there were thirteen hundred million pounds' worth of gold in the world, and it seemed then that we were unmining the stuff at the rate of about eighty millions of pounds' worth in the year, and turning about fifty mil-

lions' worth into coinage. This, you will perceive, is the mechanical or materialistic dependency of that passion of humanity which for its ferocity counts next to love, and often in advance of it. In the City of London they pay through the clearing-house (a pretty institution that the bankers have made for themselves for an annual orgy of millions) cheques to the value of thirteen thousand millions in one year. That amount of money was not comprehended a few years ago by any but those wizards of old Lombard Street, but now we know it for the trifle that it is. A great Empire, the wealthiest ever made, could have a Seven Years' War, of the modern and most expensive kind, with such an outlay. I am assured that in our London banks there have lately been deposits worth seven hundred millions; I saw that the other day a ship took five million sovereigns over from England to lucky America; and then the cables informed us that there had passed through the township of Worcester in Massachusetts, on its way to New York, a train of steel cars so stacked with sovereigns, American bonds, and millions in every variety of form, that sixteen million pounds' worth were aboard. But little are we impressed. Gold seems common enough, and a change is needed for our entertainment. In England we have discovered in ourselves a high appreciation of paper; in Russia they have cardboard money; unhappy Germany has taken to iron; and one can admire the taste of the dwellers in Yap, one of our new possessions in the Caroline Islands, who for money use thick stone wheels, varying from one to twelve feet in diameter, with a hole through the middle so that they may be strung on a pole for currency's sake; *fei* they call it. The standards that have endured through the ages seem to be disturbed; the subtle treatises on political economy which have baffled our unfinancial understandings must now be revised; if the majesty of the million is to be preserved, something new must be discovered, deeper in the earth and rarer. If something is now lost to life through the disappearance of the awe of figures, we must turn for its revival to the billion. A billion is a million millions (in this country), and it is still imposing. It has possibilities. It has a friend in the electron discovered by the mathematical physicists. When

at school we toyed with the pretty idea of the indivisible atom, so unthinkably small, we were as pioneers in figuring and minute division. Now it appears that twenty-five billion electrons ranged alongside would occupy but an inch of space, and that if we filled a little thimble with these tiny beauties, and poured them out from it at the rate of one thousand in a second, we and our exhausted posterity, far flung along the ages, would be occupied with this task for seventeen trillion years—which is 17 with a hardy regiment of eighteen O's behind it.

* * *

And in the matter of space, also, this new interest of infinity seems to be taking hold. The Astronomer-Royal has been telling us lately that two patches of light in the southern hemisphere—the Magellanic clouds they are called—contain a group of twenty-five stars which are six hundred times as luminous as the sun itself. That is perhaps the reason why they have been established at a distance of 186, with fifteen O's to follow, miles from us. It is far away—no farther than it ought to be—and one almost understands. If now we are told that there are between a thousand and two thousand million stars in the sky, it does not seem too many to our bemillioned minds; we had almost thought, with this grand suggestion of eternity above, that there would have been more. But they are enough for their lesson, never more impressive than on clear winter nights in town in recent times, when this spangled ceiling of the world told of the Creator and all immutability, and a vast design that is hardly to be comprehended by the little crawling things below, while about us there were fears and terrors, horrors, and the worst doings of the earth. Nightly they propound to every one the tremendous problem of the First Cause. Napoleon on the deck of his ship, when outside Egypt on a starlight night, heard his officers denying God, and asked them, with his hand uplifted, 'Can you tell me, gentlemen, who made all these?' And as with Napoleon, so with others since. The mere millions, now that we understand them better, need not in any way cause us anxiety. A few extra noughts make no difference now. We are not like the old farmer who drowsily listened to the astronomer's lecture in the village school. The scientist had observed impressively that in seven hundred million years the sun would be cold as the very moon itself, and so the earth would be cold, and there would be neither light nor life upon it. The good and healthy farmer came back from a dreamland of acres that gave, perhaps, three crops a year, and, struggling with this awful idea that had been expressed, called out, 'How long did ye say, sorr, it would be before that happened?' The astronomer answered, 'Seven hundred million years, my friend.' All was well; an anxiety was removed. 'Thank God!' he murmured.

'I thought ye said it was only seven million.' Again, we say, unhappy millions fallen from their proud estate. To our humble but aspiring minds some faint comprehension of the vastness of eternity itself may now be not impossible.

* * *

The million did always seem to be a more practical thing in town than elsewhere. Here, where Whittington and many others have found it to be true that the streets are paved with gold, this million is necessarily just a commodity. Its lofty manner was generally reserved for its country parades where, as one of the great things that came from London, it was held in high esteem. Millionaires, it is believed, have thrones of their own, and are only accessible by some intricate and prolonged financial processes leading to the gorgeous hall of diamonds. In London it is not like this. In some ways there is a better brotherhood, based on personal merit and common-sense, than at any other place. To the impecunious but aspiring masses that are possessed of brains the millionaire is more useful here than in New York or Chicago, and there is reason for it. The American millionaire relies far more than the British millionaire on his own effort, and he makes less disclosure of himself as a professional capitalist. He may even pose as a poor man, sighing and languishing for a pittance that should adequately serve his simple needs. Generally, as I have met him in his own country, he has been inclined to meanness, devoid of warm blood, dull and uninteresting. Mr Rockefeller is never tired of giving you fine advice on life and the achievement of success, much of which is nonsense, and the rest suspected of having been adopted from old volumes of fables and maxims. Others exercise silence and seclusion. They are human failures, and they know it; they are no good to any one. There is no more pathetic spectacle than the average American millionaire (in pounds, I mean, not dollars). There are exceptions; I have met them, but here is certainly a general rule. The British millionaire is altogether a more human thing, especially if he owes little or nothing to his father. Sometimes he has made his millions by his own efforts and genius, but this is rare. More commonly he has found others with brains, made friends of them, and used them. That is why the millionaire is accessible in town, the place of ambition. He says to himself, many times each day, that even a millionaire never knows what may turn up; and when his secretary announces that a strange gentleman, of whose name he has not heard, would like to see him, the millionaire's heart may pit-pat in a convulsive way. His ship may have come home at last! There is honesty, simplicity, good human nature about the seven-figured financier of this City. A friend who is

well known to me had the strange experience, when suffering from poverty in his early youth, of being summoned to London to discuss his professional prospects with a millionaire, and, sincerely, a fine genius. The two sat pleasantly for an hour together in an upper room in the very heart of things in London, and they talked the whole world through. The fledgling, with some hesitation, let forth some views of his own on the unsuspected imminence there had been of a war with France—that was long ago, you know—and the millionaire was in the most enthusiastic agreement. A friendship that has endured through two decades began at that time in such a simple way. About the same period the young man felt he had another proposal to make to another millionaire, and he made it, adding a few lines to the end of his letter admonishing the rich man not to reply to him unless he felt strongly and earnestly that he desired to treat with a keen fellow who burned with zeal, and who meant to go higher in a very short time. 'Do come,' was the answer by telegram; there seemed some pathos in the entreaty. There was need of him, and here again a friendship began. Who that visited him in Hamilton Place by Hyde Park did not discover how well and in the comrade manner the late Lord Rothschild could play the gallant gentleman to a humble caller? If it really seemed that the poor visitor liked the cigars that his lordship asked him to try, a servant somehow, and with no favour, would, with his lordship's compliments, impose a box of them upon him at the door on leaving. It was, I am told, an embarrassing business, for all the delicacy of execution. No, the millionaire in general has lost some of his loftiness, and in the decadence of the million has become like one of us; but in London he was always a human thing before, a good one, and friends in number pray that when the times are changed again he shall rise to billionism—leaving us, his humble supporters, maybe at the million landing.

* * *

I remember well an early disillusionment about the beyondness, of the unreckonability, of the million. It was when I saw it being made thousand by thousand in paper money, just as in these latter days and at the same place it is still being made, but in vastly greater quantities. Influence was set to work, and there came a courteous note that if I would call at a specified hour at the headquarters of the 'Old Lady' who lives at the richest spot on earth, the Director of Printing at the Bank of England would be glad to receive me, and I should witness the printing of the notes, as few were permitted to do. It was an awing spectacle. Here was a million-making factory with engines, flywheels, pulleys, and whirling straps to do the mighty business. Some sixty thousand notes,

from serviceable fivers to majestic thousand-pounders, were then being printed in a day, and nearly half-a-million of postal orders. I stood by a machine that visitors were requested not to touch. It was kept clean and well oiled, and it had many parts. It seemed no better or worse than many other machines, yet it was engaged on a tremendous business. It was working off notes at the rate of three thousand in an hour, and in a full day it would produce twenty-five thousands of them. Of its kind there is not a more wonderful sight in the City than this machine, only eight or ten feet long, reeling off in a continuous stream oblong sheets of paper, each having the magic £1000 stamped upon it twice over—the sheets each embraced two notes, and had afterwards to be cut—so that three million pounds of money may be made in a single hour. My friend informed me that the day before one of the machines had been running from morning till night on hundred-pounders, and had piled up two and a half millions of money on its own account. There were many of these machines in that wondrous hall, and they were making eighteen million notes in a year. A marvellous and most comprehensive place is this paper-money factory. Upstairs I saw a foundry for the casting of lines of type to print the names of Government stockholders, a line for each one of them. Many precautions are observed to maintain secrecy about the stock held by different people. For certain show and other purposes there is kept a specimen printed book in which all the names are fictitious, imaginary stock and imaginary dividends being apportioned to imaginary stockholders. If that book were to be believed there is a considerable amount of stock standing in the joint names of Oliver Cromwell, John Pym, and John Hampden, deceased; M. Coverdale and W. Tyndale being their executors. I see also that William Caxton, whose memory I specially revere, and Wynkyn de Worde, both gone, are the nominal holders of another batch of stock; and again that William Shakespeare, Geoffrey Chaucer, and John Milton, all among the shades, had each and all of them invested some of their profits from literature with the Government. The factories of the Bank are places of methods and mysteries, and in their way they are to some minds just a little unsettling. It is a versatile Bank; by its charter it is empowered to sell beer.

* * *

But from all such thoughts of earthly millions, grave and sometimes a little gay, as may be permitted by the seething circumstances of these times, the imagination has a suggestive way of flying among the stars. It almost used to seem in the days and nights when the higher mysteries were carelessly neglected, and the grandest exhibitions of the universe ignored, that astronomy

was a thing only for hermits and those who dwell in seclusion on the tops of high mountains. The common people disdained it. Now in these darkened nights, when the lights of the heavens are the brightest that we know, when the moon is more blessed than ever moon was since the firmament was set in order, we all become little astronomers; we love and respect the stars. We look for their changes of situation; we welcome them, and bid them a regretful good-bye when they go. Always they induce the sad reflection of the puniness and the stupidity of little man. Here is the firmament in its grand and majestic order, regulated through its millions of time, its millions of space, its infinity of everything, with the most marvellous precision; and here we be on this poor patch of Europe, flung by ourselves into such a chaos of disorder as no world has ever known. And we are all disposed to be something of astronomers now. We had happiness through Venus in this last dead, ugly winter as never before; many then knew her for the first time. She was grandly situated, and for a time she shone by Buckingham Palace in a glorious brilliance. And near the end of the winter season a strange thing happened. Venus and Jupiter, both at their best, came into conjunction in the western sky.

It was a dazzling sight. But by many there was an odd misunderstanding concerning it. Viewed from, say, the War Office, these heavenly lights seemed poised above the Horse Guards, and, so low and so brilliant did they look, the sparkling Venus and the lesser Jupiter but a couple of yards below, there were notions among the little people so far underneath that these were not indeed stars, but something belonging to the schemes of our authorities for preserving the safety of the City from marauders coming westwards through the sky from the foe in Germany. What a strange delusion! Venus and the War Office! Yet it was believed. And at that time Venus in her western sky was twenty-five million miles away from us who gazed upon her, and Jupiter, who looked less in consequence, was four hundred million miles away! And these two, now so near together, as it seemed, though so many million miles apart, were flying away on their own divided courses, Venus in the one direction at twenty-two miles a second, and Jupiter at eight miles a second. Here surely is the highest romance of the million. What does the five millions a day matter, after all? It is a little thing, so very small. There is the universe, that made Napoleon wonder.

GOLD IN WAITING.

CHAPTER IV.—*continued.*

THE three small men were assembled at the house of Perriker the barber, and great things were written on their faces. For only to-day a little Jew attorney had come over from Wayford, wanting to buy certain lands, but, after the manner of his kind, disparaging what he wished to have. Particularly did the little attorney desire that fine stretch from the Cove to Gull's Nest. 'I'd got my fingers on that,' he said, with a wry smile, 'when you stepped in and took it from me!'

He had named his prices, thinking to clinch the matter then and there. Indeed, he had the money with him, in crisp notes. But they told him to stand off a while. This was a busy day. They would consider his offers.

He had gone away grumbling, saying he would be back after Christmas. And now, their business for the day done, their shops shut, the fire roaring, and Christmas cheer at hand, the three small men were met in conclave. So their hard-earned money was to yield them a fine harvest. For this was only the beginning, since they knew that it was proposed to build a fine new inn and houses to accommodate the gentry who came to Sparcliff in increasing numbers every summer-time. As for Perriker, purchaser of that desirable stretch facing the sea, he had already determined that the most tempting offer should

not wrest it from him. He would build upon it himself. So said Perriker, and the others approved what he said. They would each sell some land, and with the money they would build.

'If the old man had lived,' muttered Perriker, as he raised his glass and nodded to his two friends, 'what a price he'd have had from them!'

'Like as not he'd have frightened them off,' said little Maggs, 'for he was a terrible hard one in a deal.'

'Nevertheless, here's one to his memory,' said the smith, lifting his bumper. 'He was a straight man, for all he was hard. A strange thing he should have left so soft a son.'

A silence fell upon them, and a slight chill seemed to pervade the warm parlour; for, they were reflecting—you could read it in their faces—had it not been for that son and his sottish ways, but little of this money that was coming to Sparcliff would have fallen to their pockets.

'We could not,' said Perriker at length, 'have acted otherwise. Better for men of the place to have the land than the Wayford Jew. The old man would have wished it.'

'Nevertheless,' said little Maggs, who was the least shrewd of the three, 'it seems hard on the

lad, not to speak of his wife and the little one just born to them.'

The smith stirred uneasily. 'We will, of course, see that those two never want.' He spread out his great hands. 'As for Ebenezer Fancit, who can save him from himself?'

'God only,' said little Maggs, with a wistful shake of his head.

And even as he spoke there sounded in their ears a clatter of hoofs in the village street, and following that a sound of voices, of doors opening, of people assembling.

'What's amiss?' exclaimed the barber, going out and opening his street door. In a minute he was back.

'There's something greatly amiss,' he said hurriedly, his smooth, full face wearing a look of consternation. 'Fancit's house is afire, and here's his horse riderless.'

The smith was on his feet in a moment. All three went out. A man with a crowbar was smashing his way into Fancit's house, from the back of which smoke was rising. The mare was the centre of an agitated group of villagers.

'I saw him ride off down the hill but just now,' said a woman.

'By your leave,' said the smith, pushing his way to the horse. 'Likely he's come to grief at the stream.—Let us have that lanthorn, Joe Thurrock.—Some of you come, and t'others be quenching that blaze.' And mounting the horse, he rode off down the hill, the lantern swinging in his hand. Perriker and Maggs, procuring their hats and greatcoats, followed on foot.

The mare was snorting and trembling, for she liked not to be going to the water again. Behind the horseman a streak of flame shot up from the old house, for the liquor in the cellar was on fire.

Down the long hill rode the smith. Approaching it, he could hear the stream rushing turbulently between its banks. Reaching, at last, the spot where the stream crossed the road, a smothered exclamation came from him; for, on that portion of the footbridge which was still standing, he perceived a woman's form.

'Steady, lass!' he cried sharply, as the mare flinched from the flood. 'Steady now!' And he put her to the water firmly. The fierce swirl of the stream took her off her legs, and with heaving chest she put out her strength to make the far side. The smith, sitting the saddle like a Centaur, let the lantern drop, and leaning over to the left, snatched the woman from the bridge. And as the mare's feet found the road again the last crazy timbers of the little bridge were gone.

A lantern shone in the near distance, and next moment Farmer Clinkscales appeared, some anxiety in his face.

'Be that you, Ebenezer Fancit?' he asked.

'Nay, it's Burden,' said the smith. 'Take your lass, farmer.'

'She would go alone. She was going to fetch him,' quavered the old man, as he received the dripping form. 'We couldn't abear the thought of him in that house by himself.'

Other figures were approaching from the farmhouse, and on the village side lights flickered towards the dip in the road where the stream passed.

'Let your men come with me,' said the smith; 'for if he's not in that blaze he's in the water, and the Lord help him either way.'

Crooning over the insensible form of his daughter, the old farmer, with the help of one of his men, bore her away to the house, while the smith turned his horse's head down the stream. Perriker and Maggs were on the opposite side, and, thus searching, the moonlight intermittently aiding their lanterns, the three small men at length came up with the man they sought.

A fallen tree had caught him, and the waters surged over him as he lay like a bit of driftwood against it. You could just see his white face, with the black hair tumbling about it. The smith, dismounting, plunged in waist-deep and drew the body to the bank. And from his throat came a sob, for Ebenezer was drowned. He was drowned, and upon a Christmas Eve! And when the tale was told of how he died, men bowed their heads reverently, and all said that in the manner of his dying he had made amends for the way he had lived. And the young rector, of the calm life, preaching upon it, said that Ebenezer Fancit had gone into the water a great sinner, but had come out of it, as they must all feel sure, cleansed and pure, in that he had paid the highest price a man can pay, giving his life for another.

So Sparcliff rose to be a great marine county borough, and the little John Fancit, when he grew up, found himself a rich man, for by agreement made with his mother in her early widowhood, the three small men claimed and received the right to give to the boy one-half of all the profits they should make out of his father's lands. They put it to her—and how could she, in her sorrowing, know or care otherwise?—that they had secured Ebenezer's property to save it from others who were preying on his weakness; and, indeed, that was partly so, wherefore it appeared to her that the pact was a just one.

To-day the sun shines merrily on the golden sands of Sparcliff and its happy holiday thousands; it shines upon the great house standing within the tall trees at the far back of the town; it shines upon the Fancit almshouses, themselves coming to be veterans; it shines upon certain ancient tenements in Sparcliff Old Town that once sheltered the three small men who were the first to exploit the possibilities of the village; and it shines upon the orderly shaven grass of the churchyard, wherein lie old John Fancit, and his son Ebenezer, and Alice, the wife of

Ebenezer, and upon a certain patch of ground that was once the site of a house, but was a hundred years since gathered again to its mother green. It shines now as it shone in that old time, and so it will shine when present men, and their joys and griefs, and their good deeds and

evil ones, are swallowed up in the remote past. But present men, like the three small men, may prove themselves worthy of their day, and be held in honour for the heritage they leave to generations unborn.

THE END.

THEN AND NOW.

A COMPARISON AND A FORECAST.

By the Rev. SYDNEY DENTON, M.A.

THERE is no more fascinating period in our national history than the one which terminated a hundred years ago at Waterloo. Interesting at all times, it has assumed, in the light of the present war, an importance which cannot be overestimated. For it is not merely the record of our long struggle for national existence, telling us of sufferings bravely borne, and of sacrifices willingly made, by those who thought no cost too great so that Britain might live; it is also a mirror in which we may see our immediate future reflected.

We know already that the burden we shall have to bear will be a very heavy one, taxing our resources to the limit; and already we are wondering how we shall be able to accommodate ourselves to the new conditions thrust so suddenly upon us, for we know that the present generation cannot hope to see the pleasant days of prosperity which now seem so far behind us. In point of time only nineteen months have elapsed, but in intensity we seem to have passed through a lifetime.

There are some who take a very despondent view of the future; for such as these the study of the past should prove a useful tonic. There are others determined to make the best of circumstances, an attitude much to be commended. To all alike, however, the past experience of our ancestors should proclaim a message of hope and calm confidence.

The war may end sooner than we expect, or it may drag on for many weary months; but whether the time be long or short, we may with equal advantage make our comparison, for in either case it will serve many useful purposes. It will show us the real measure of our burden; it will reveal the strength or weakness of our resources. Above all, it will show us the things we shall do well to copy, and also those we shall do well to avoid.

There are some, however, who say that there is no true basis of comparison between the present crisis and any other which has occurred in our national history. They say the world has never before passed through so terrible a period; it not only dwarfs, it extinguishes anything which has ever happened in human experience, and threatens to sweep away our modern civilisation.

It should be remembered, however, that a crisis may be in actual magnitude outside human experience, and yet in proportional magnitude it may be no greater than one which has already occurred; and it is just this sense of proportion which we need to bring to the calm consideration of the present and the immediate future. The question for us, after all, is not so much what we actually expend, but our power as compared with that of our ancestors to distribute the burden. A comparison such as this goes to show that, so far, our burden is not by a long way so great as was theirs, and also that to the world, as it then was, the long-drawn-out agony of the Napoleonic wars, in loss of life, expenditure of treasure, and human suffering, was as great as ours is proving in the present titanic conflict. We are suffering now from a great rise in the price of all articles of domestic consumption, and it is estimated that the cost of housekeeping has risen by about 30 per cent. This is indeed a heavy burden upon small incomes, and one which is being severely felt by all classes. On the other hand, however, there is no lack of employment. We are passing through a period which we may term one of fictitious prosperity owing to the great demand for labour of all kinds, and as a result of this there are fewer inmates to be found in our work-houses than usual, and there is perhaps less real suffering among the poor than in normal times of peace.

It was very different a hundred years ago. There was then, it is true, a prosperity among certain classes which could scarcely be called fictitious; but the great mass of the population was perilously near starvation. On one occasion it was said in Parliament that the farmers were making a profit of 200 per cent. The speaker, the Earl of Warwick, added that he did not wonder at the extravagant style of living of some of the farmers, who could afford to play guinea whist, and were not contented with drinking wine only, but mixed brandy with it. He went on to say that on farms from which they derived so much profit they could afford to leave one-third of their land uncultivated, the other two-thirds yielding enough to support them in their extravagance. Under such conditions it is not surprising that bread reached famine prices.

Occasionally the quartern loaf fell to elevenpence, and even as low as ninepence; but it usually ranged from one shilling and twopence to one shilling and fivepence, and there were times when it was as high as one shilling and ninepence. It stood at this price in 1800; and early in that year such was the scarcity of grain that the king issued a proclamation exhorting all persons who had the means of procuring other food than corn to use the strictest economy by abstaining from pastry, reducing the consumption of bread in their respective families by at least one-third, and upon no account to allow it to exceed one quartern loaf for each person in one week. It was also made illegal for any baker to expose bread for sale that was not twenty-four hours old.

Coal is of more vital consequence to us now than it was to our ancestors, for we have not the supply of wood which then was plentiful in country districts, and thirty shillings or more a ton is a high price even for the well-to-do, and for those compelled to buy in small quantities almost prohibitive. Our present prices are, however, reasonable compared with the prices which prevailed a hundred or more years ago. In 1806 the chaldron of twenty-eight and a half hundred-weights was sold at sixty-four shillings, in 1809 it rose to seventy-four shillings, and in November of that same year it rose as high as eighty-four shillings. What the poor in large cities like the London of that period must have suffered can be imagined rather than described.

We might continue this comparison of prices much further, but it is unnecessary; the fact remains that the further we pursue it the more we learn that our position is infinitely more favourable in every way. It has been necessary for us to exercise greater economy than in the times of peace, and many articles which were formerly classed as necessities have become luxuries, to be consumed in smaller quantities or to be altogether done without; but the actual pinch of want has not reached us. The labouring man, comparatively, is as well off as any other member of the community; but a hundred years ago he could scarcely be said to live, in the true sense of the word; he eked out a miserable existence little removed from that of the brute beast.

The taxation of the people was excessive, and so far-reaching that it was difficult to find an article which did not pay duty in some shape or fashion. The Chancellor of the Exchequer complained in 1811 'that there was not an article of dress—boots, shoes, leather, breeches, &c.—which had not been recommended to him for taxation.' The income-tax stood at 10 per cent., and only incomes below sixty pounds were exempt. It was said in those days that men were taxed from the cradle to the grave. One could go even further than this, however, and say with truth that they were taxed for the air

they breathed and also for the light by which they worked, for the window-tax was literally a duty on light and air; of all objectionable and harmful taxes it was the worst ever devised by man's ingenuity, and yet in spite of this it was not repealed until the year 1851.

For twenty years our ancestors endured the ever-increasing load until the maximum was reached in 1815, when a sum of no less than one hundred and twenty million pounds was needed to meet the current year's expenditure. It is very difficult to compare their actual financial position with ours at the present time, there are so many different and varying factors to be considered; but when we bear in mind that the population of Great Britain was then only twelve millions, and that it is now over forty millions, and that the income-tax in 1815 produced little more than fourteen million pounds, levied at 10 per cent. under very stringent conditions, it would seem that we have some way yet to go before we shall reach a proportionate rate of expenditure. In making an exact calculation we should have to take into consideration the present value of money as compared with that which prevailed in those days. The purchasing power of the sovereign has so fallen since the beginning of the war that the relative values are probably much the same; but at the beginning of this century it was calculated that twenty-six shillings and eightpence represented the sovereign as compared with the twenty shillings in 1800. We should also have to compare the present state of our currency; and here we should find the comparison most favourable, for, while it is true that much paper money has been issued, there is no evidence of its depreciation as compared with gold, whereas in 1815 the price of gold had risen from three pounds seventeen shillings and tenpence halfpenny per ounce to four pounds ten shillings per ounce, so that it paid to melt sovereigns down and sell them as bullion. We should have, lastly, to give accurate statistics of the actual wealth of the country at the different periods, a difficult, and for the ordinary reader an unnecessary, task.

There is no reason at present for undue pessimism as to the future of this country. That hard times are before us is evident to every thinking mind, times which will need much fortitude and a drastic revision of our scale of needs. We shall have to discriminate between the things we want and the things we can do without, for the age of luxury has gone. Our children may possibly see it return; but the present generation will have to be content with memories of the past. We shall lose much; but if we face the future in the spirit of our ancestors we shall gain far more than we have lost.

In some respects our task will be harder than theirs, for we cannot possibly return to the primitive conditions which contented them, and it goes without saying that we would not, even

if we could. Social conditions have altogether changed. We cannot, and we dare not, put the clock back; but there are none the less great fields open to the true economist in preventing the scandalous waste of public money squandered in excessive rates, alike in our large towns and in small country villages where gas and paving are unknown. We shall require an increased sense of public duty from the more responsible members of the community, and the council in town and village must no longer be the home of ambitious mediocrity.

There is one lesson of the past we shall do well to learn. Our ancestors failed to recognise that in the State as in the Church we are all members one of another. In the reconstruction

which lies before us, one class of the community must not be exploited at the expense of another, and the hateful cry of the classes against the masses must never again be raised. It has ceased to be uttered face to face with the foe. There we have been Anglo-Saxons only, facing a common task in the true bond of brotherhood, community of aim, and community of danger. The bond created under such conditions must continue, and rich and poor must be united in their willingness to bear all needful sacrifice. Then we may hope that Britain will arise in due time from her season of recuperation, grown once more to the full measure of her strength—a nation which has been weighed in the balance and not found wanting.

PINCHER MARTIN, O.D.

CHAPTER III.—*continued.*

SUCH a variety of shell there was! Some had bright-yellow bodies with red bands round their middles, and sundry stencil-marks on their sides denoting the date and place of manufacture, date of filling with explosive, and other purely personal details. These were the lyddite high-explosive shell Martin had often heard about; and he was informed, by an A.B. who was lowering them below as if they had been mere sacks of potatoes, that they burst into thousands of minute fragments on impact, and that they were designed primarily for use as man-killing projectiles against the unarmoured portions of an enemy's ship. Then there were the common shell with black-painted bodies and red-and-white bands round their noses. They, too, were deadly in their way, but not quite so deadly as the lyddite, since they were filled only with black powder, and did not burst so violently on striking. The armour-piercers were also black, and had white-red-white bands round their heads. They, Martin was told, had very thick walls and specially toughened points, and were designed to bore their way through an enemy's armoured sides and to burst inside. Then came the shrapnel shell for the lighter guns, with their red tips and red bands; they were provided with a small bursting charge, were filled with bullets, and had time-fuses, so that they could be burst in the air at any moment, to send their leaden bullets flying on over a cone-shaped area of destruction. The practice projectiles were black, with yellow bands round their middles and white tips. They were quite harmless, being made of cast-iron, with small quantities of salt inside to bring them up to the exact weight.

It was quite six o'clock in the evening by the time the ammunition had all been taken in, and even then there were many hours' work in stow-

ing the shell, corlites, and explosives in their several shell-rooms and magazines.

The next morning, at cock-crow, they started another very similar job, taking in slops and stores of provisions from the victualling yard. This time the deck was littered with bundles of clothing done up in sacking, bags of flour, boxes and cases containing boots, shoes, straw hats, caps, biscuits, condensed milk, tea, coffee, chocolate, jam, preserved meat, tinned salmon and rabbit, mustard, pepper, salt, raisins, rice, dried beans and peas, pickles, suet, compressed vegetables, oatmeal, split peas, celery-seed for flavouring pea-soup, soap, and tobacco. There were also casks or drums of rum, vinegar, and sugar. The total consignment ran into well over a hundred tons dead weight, and all the hundred and one different articles had to be hoisted on board, sorted out, transported, and stowed in their proper storerooms.

The ship's steward and his assistant 'dusty boys' had a very busy day. Quite early in the proceedings a flour-bag burst like a shell and deluged the steward with its contents. He was powdered from head to foot, and remained so for the rest of the day; and the little runnels of perspiration running down his whitened face made a strange criss-cross pattern which transformed his ordinarily rubicund countenance into a very fair representation of a map of the planet Mars, with all the canals clearly marked. His appearance caused titters of amusement and howls of derisive merriment when his back was turned, as, armed with an enormous note-book and a sheaf of coloured pencils, he flitted in and out of the piles of boxes and packing-cases like a lost soul. He was endeavouring to trace odd cases of raisins, or errant boxes of jam or pickles, and looked very worried, poor man! At any rate, it was hardly safe to talk to

him, for finding the mislaid things among the heaps of barrels, drums, cases, and boxes, which covered the deck in places to a height of fully five feet, was for the time being rather like searching for a pebble on the bottom of the Atlantic Ocean.

II.

The *Belligerent* was a 'Pompey'* ship. Many of her officers and men had their homes in or near the port, so the 'funny party'—otherwise the ship's concert troupe—prevailed upon the first lieutenant, their honorary president, to petition the commander for permission to give a farewell entertainment on board the evening before they sailed to rejoin the squadron.

The commander, with visions of endless trouble in rigging a stage for the performance, and the sacred quarterdeck being littered with cigarette-ends, banana-skins, and orange-peel, was not altogether pleased at the prospect. 'They want to give a show!' he said, in surprise, when the first lieutenant mooted the subject. 'Great Scott! they must be mad. It's midwinter. Suppose it's raining or blowing a gale o' wind?'

'Yes, sir. I pointed that out to them,' answered No. 1. 'I quite realise there are serious objections. They're so jolly keen on it, though, that I couldn't choke 'em off.'

'And they propose that we shall bring all the guests off in our boats, eh?'

Chase nodded. 'They do, sir,' he said. 'But I'll take the management of all that off your hands if you'll let me. They want the show to start at eight o'clock.'

'The devil they do!' laughed the commander, beginning to relent. 'You'll have to cut the encores, though. It'll have to be over by ten-fifteen at the latest. We're sailing the next morning.'

'I'll see to that, sir.'

'Are the officers and their wives to be asked?' the commander wanted to know.

'Oh yes, sir. They specially mentioned that.'

'Well, for goodness' sake censor the programme. Last time we gave a show and had ladies on board, one of the songs was altogether too—er—spicy. I can't remember who sang it, but one of the captain's guests was very much shocked. For heaven's sake make certain it doesn't occur again!'

'Yes, I'll do that, sir,' smiled No. 1, with vivid recollections of the incident.

'All right. I'll ask the captain, then. I don't expect he'll object. You'd better tell me beforehand how many boats you want to bring the people off, and I'll leave all the rest in your hands.'

'Thank you, sir.'

The captain raised no objections; and on the afternoon of the entertainment the carpenter and his men, assisted by the members of the 'funny

party' and many willing volunteers, set about preparing the quarterdeck. The day, luckily, was fine, but bitterly cold. A temporary stage, built up of planks placed upon biscuit-boxes, was rigged right aft athwartships. It was provided with the necessary scenery painted on board, was decorated with flags and coloured bunting, and was flanked by a brightly polished twelve-pounder gun and a Maxim on their field-carriages. The awning overhead was shrouded in enormous foreign ensigns, while canvas side-curtains were laced all round the quarterdeck to keep off the wind. Seating accommodation for several hundred people was provided by bringing all the available stools from the mess-decks, and placing them in rows on the deck and the top of the after-barbette, with its two 12-inch guns. The first two rows of stalls, so to speak, were reserved for the officers, and consisted of arm-chairs and other chairs borrowed at the last moment from the officers' cabins and messes.

By seven-forty-five the preparations were complete, and the guests were beginning to arrive. As they stepped over the gangway they were claimed by their respective hosts, presented with printed programmes, and conducted to seats. By seven-fifty-five the last boats had come off, and the quarterdeck was tightly packed with men and their female belongings. They were all very much on their best behaviour, talked in hushed, expectant whispers, and spent the time criticising their neighbours and admiring the drop-scene.

The drop-scene was a truly terrific representation of the *Belligerent* in action. It had been painted on board, and the artist had allowed his colours to run riot. The sea, well covered with shell-splashes, was very, very blue, and so was the sky. The ship herself, with flaunting White Ensigns hoisted everywhere, was fiercely blazing away with every gun at some invisible enemy over the horizon. Here and there the blue expanse of sky was punctuated with large yellow and white blotches. Whether or not they represented clouds, the bursting of hostile shell, or cordite smoke, nobody but the artist could say. They did equally well for any one of them. At the bottom was an elaborate scroll, royal blue in colour, inscribed with the battle honours of previous *Belligerents* in gold letters; while in the centre came the ship's crest and motto, '*Ut Veniant Omnes*,' the Latin equivalent of 'Let 'em all come!'

Before long the guests thawed a little, and the place began to hum like a beehive. The ladies produced chocolate and other edibles from handbags, and thrust them on their neighbours in token of friendship. The men lit pipes and cigarettes until the air was blue with tobacco-smoke. Martin, with several other youngsters, had installed himself in an excellent position on the top of the after-turret, and waited anxiously for the performance to start.

The chattering ceased as the orchestra filed

* 'Pompey' is the naval slang term for Portsmouth.

out from the wings and took their places behind a zareba of bunting-covered biscuit-boxes and hired palms erected in front of the stage. They all wore their best tunics, had their hair well parted and greased, and seemed very full of their own importance. They concealed themselves behind their barricade until only the tops of their heads were visible, leaving the bandmaster perched precariously on a chair set on a couple of rather insecure boxes. He wore a brand-new pair of white gloves in honour of the occasion, twirled his moustache, and tried hard not to look self-conscious.

'Swanker!' came a loud and very raucous remark from the top of the after-turret. Martin, greatly daring, but carried away by the excitement of the moment, had been responsible for the utterance. He looked round apprehensively, half-expecting to get into trouble for his temerity; but every one seemed quite pleased. The audience was actually tittering. The titter became a laugh, and the laugh a roar of delighted amusement. The bandmaster, with his back to the gathering, seemed rather agitated. He half-turned on his chair, thought better of it when it gave a dangerous wobble, and then pretended he had not heard.

The culprit, undiscovered save by his immediate neighbours, hugged himself at the success of his sally.

A minute later, when the band began to tune up for the overture, the first lieutenant appeared from one of the after-hatches. He had the reputation of being a 'taut hand;' but the men loved him dearly, and his arrival was the signal for a volley of cheers and hand-claps. He faced the audience nervously, bowed and smiled, and then, watch in hand, walked across to the bandmaster and held a whispered conversation.

Other officers came up the after-hatches and filed into their places. They were greeted with round after round of applause, as, very red in the face and very uncomfortable, they settled down in their seats. The *Belligerent* was notoriously a happy ship, and on occasions of this kind her ship's company were not slow in showing their appreciation for their officers.

The captain had been having a dinner-party in his cabin for some of the married officers and their wives; and he, the commander, engineer-commander, fleet surgeon, Hatherley, and Tickle, with their respective wives, arrived last. They, too, received their share of cheers while taking their seats. The captain, however, remained standing, and held up his hand for silence.

'Ladies and gentlemen,' he said when the uproar had subsided, 'I am very glad to see you all here to-night, and I hope you will enjoy the entertainment. The first lieutenant asked me to sing you a song myself, but I'm afraid I'm getting too old for that sort'—

Loud cries of 'No, no!' and more cheering.

'I am,' he continued, laughing, 'though you

may not believe it. What I want to tell you is that I have arranged for light refreshments to be served in the battery during the interval, so I hope you will all—er—do full justice to them.'

Loud cheers, during which Captain Spencer sat down and nodded to the first lieutenant for the entertainment to begin.

The latter left his chair and glanced at his programme. 'Ladies and gentlemen,' he said, 'the first item on the list is a selection by the band. It is called—er—"Down Channel," and has been specially composed for the occasion by Mr Johnson, the bandmaster.' He sat down again.

The bandmaster rapped twice with his baton, and with a rattle of drums the music began. The selection was a strange pot-pourri of every nautical song that Mr Johnson had ever heard. It started off with a variation of 'Hearts of Oak,' wandered into 'The Bay of Biscay,' 'Tom Bowling,' 'They all love Jack,' and several other tunes, ancient and modern, and finished off with 'The Red, White, and Blue' and 'Rule Britannia.' It was hardly original, but it was received with vociferous applause. The bandmaster, highly satisfied, rose from his chair and bowed his acknowledgments with great dignity.

'The next item on the programme,' said the first lieutenant, rising to his feet again, 'is a comic song entitled "Archibald," by Stoker Williams.'

The footlights were turned on, and the curtain went up to disclose Stoker Williams dressed in the height of fashion. He wore a morning coat, gray trousers, patent-leather boots and spats, eyeglass, immaculate shirt, collar, and tie. He represented, it would seem, a young man about town looking for a friend named Archibald. Presumably he had some difficulty in finding him, for he walked mincingly across the stage, grasping a cane and a pair of gloves in one horny hand, and in the other a very glossy top-hat, which he twirled violently when the spirit moved him. The first lieutenant fidgeted uneasily. The hat, a brand-new Lincoln & Bennett, belonged to him. So did the clothes. The chorus of the song went something like this:

Har-ar-chibald! Har-ar-chibald!

Son of a belted heart.

Har-ar-chibald! Har-ar-chibald!

I'll bet 'e's mashin' 'is girl.

'E promised to meet me at 'arf-past three;

But 'e's such a nut that 'e's gone on the spree.

With 'is girls, girls, girls.

(Spoken) 'Har-ar-chibald! where are you?'

The words were not conspicuous for their wit or cleverness, but the tune went with a swing, and the audience, highly appreciative, rocked with laughter; and after the performer's 'Now all together, please,' at the end of the first verse, joined in the inane chorus until the roar of 'Har-ar-chibald! where are you?' could have been heard as far as the dockyard gates.

The song eventually came to a close with Archibald still missing, and Stoker Williams, very pleased with himself, left the stage amidst clapping, cat-calls, and loud cries of 'Encore!' But encores were barred, and the curtain came down with a crash.

The next turn was by the P.T.I. (Physical Training Instructor). He was a magnificently built man, and appeared, despite the weather, clad in flesh-coloured tights, sandals, and an imitation tiger-skin. 'Ladies and gentlemen,' he said, advancing to the front of the stage and addressing the audience in the approved music-hall manner, 'with your kind indulgence I will now introduce a few lifting feats without apparatus of any kind. After that I shall have pleasure in giving a display with the Indian clubs. For the first part of my performance I must ask a member of the audience weighing at least ten stone to join me on the stage.'

After some hesitation and tittering, the challenge was presently accepted by Able Seaman M'Sweeny. Tubby, as he was called by his shipmates, was a short, rotund, and very bulbous person, who was a source of unfailing amusement to his friends. He had a fat red face rather like an apple, and a pair of humorous blue eyes; and, being something of a buffoon, was delighted at the idea of making himself conspicuous. He pretended to be very nervous, left his seat amid shouts of laughter and cries of 'Good old Tubby boy!' from the lookers-on, and presently appeared on the stage with the P.T.I.

'This gentleman informs me that he weighs thirteen stone,' said the P.T.I., producing a broad strap; 'one hundred and eighty-two pounds. I first place the strap round him, so'—buckling it round Tubby's middle—'and will now ask him to lie flat on the deck in the centre of the stage.'

This was rather more than M'Sweeny had bargained for, for he guessed what was coming next. But he acquiesced nevertheless, and, turning his funny face toward the audience with a solemn wink, began to agitate his arms and legs as if he were swimming.

Martin, on the verge of hysterics, was slowly becoming purple in the face. He had never seen anything quite so funny in all his life.

'Look at our Tubby boy!' came another loud remark from a youth seated near him. 'Ain't 'e the limit?'

The P.T.I., seeing that Tubby was getting all the applause, became very wroth. 'Look here!' he growled in a very audible whisper, 'is this your turn or is it mine? Knock off playing the fool, can't you!'

The victim, breathing heavily and balanced on his most prominent part, with the tips of his toes just touching the floor, looked up with a grin. 'Ere,' he asked loudly, 'w'ere do I come in?'

The audience rocked in their seats, with tears streaming down their faces.

'Shut your fat head!' whispered the gentleman in the tiger-skin.—'Ladies and gentlemen,' he went on, producing another short strap fitted with a stout hook, 'I hook this into the strap passing round the gentleman's body, so, and shall now carry him round the stage in my mouth.'

The 'gentleman' seemed distinctly nervous, but it was too late to back out now.

The band broke into slow music. The P.T.I. bent down, seized the strap in his mouth, and, bracing himself with his hands on his knees, lifted M'Sweeny a few inches off the floor. Then, with another heave which very nearly precipitated his victim and himself into the middle of the orchestra, he swung his burden waist-high, and staggered slowly round the stage with his back bowed and his muscles bulging.

Tubby, suspended by his centre of gravity, hung limply, with drops of perspiration trickling off his face. He was desperately alarmed lest he should be dropped with a crash, poor man!

The P.T.I., who, judging from his stertorous breathing, had undertaken more than he had bargained for, tottered once round the stage, and then went to the side and lowered his prey gently to the floor out of sight of the audience. At the same time the big drum gave a pre-arranged and very resounding crash. The audience laughed themselves hoarse, and cheered uproariously. After sundry other feats of strength with a long wooden bar from which depended the limp figures of two Royal Marines, one ordinary seaman, and one stoker, the performer gave his club-swinging display with lively music from the band. It was quite effective, and came to a close with great *éclat*.

The next item was a very doleful sentimental ditty about a lonely robin. It was sung by an intensely serious A.B., and the bird, it appeared, was on terms of great intimacy with a lady suffering from an incurable disease, who was slowly dying in the top back-room of a cottage. Every morning at breakfast-time the robin appeared on the window-sill; but on one memorable occasion he came rather late, to find the undertakers in the house. The shock unnerved him to such an extent that he died too, poor bird! It was so intensely pathetic that some of the ladies in the back-rows actually wept. The two rows of officers and their wives blew their noses and hid their faces in their programmes. Their shoulders shook visibly, but not with grief.

'The next thing,' said the master of ceremonies—rather perturbed because the last man had exceeded his appointed time by three minutes—'is a song called "Slattery's Mounted Foot," by the members of the troupe.'

The curtain went up to show a man clad more or less as a soldier. He wore a marine's red tunic, baggy blue trousers with broad yellow stripes, a cocked hat with an enormous plume,

a naval cutlass, and a pair of leather sea-boots with huge tin spurs. He sang the first verse of a song amidst much amusement, and then started the rollicking chorus :

Down from the mountains came the squadrons
and platoons,
Four-and-twenty fighting men and a couple of
stout gossoons.

At the cue 'squadrons and platoons' the Mounted Foot, riding home-made hobby-horses with flowing manes and tails, galloped on to the stage. Their appearance was the signal for a volley of shouts and laughter, in which the music was quite inaudible, and truly they were comical. There were six others besides the first man, who, it would appear, was General Slattery himself. They all wore burlesque military uniforms. One was a hussar, another a lancer, a third a soldier in a British line regiment, a fourth an Indian cavalryman with lance and turban all complete, a fifth a cross between a Chasseur d'Afrique and a Chinese brave, and the last an artilleryman. The *pièce de résistance* was the artillery itself, for the last man to arrive led the very unwilling Nellie, the ship's pet pig, to which was attached a large cardboard cannon. Headed by their General, they pranced about the stage enjoying themselves hugely. Their efforts brought the house down, for they quite succeeded in making fools of themselves, and 'Slattery's Mounted Foot' was a long way the best event of the evening.

The remaining turns were too numerous to be mentioned in detail. They included further ditties by the singers of 'Archibald' and 'The Lonely Robin,' a banjo solo, some really clever conjuring and lightning sketching by an engine-room artificer, and an absurd sketch, written on board, called 'The Broker's Man.' The plot of this production, if it could be called by

such a name, can be deduced from the list of characters :

Mr Stony-Broke—an impoverished aristocrat.

Mrs Stony-Broke—his wife.

Miss Gertrude Stony-Broke.

General Sir Thomas Dammit, K.C.B.—a rich uncle.

Mr Hardcash—a hard-hearted landlord.

Mr Theodore Buggins—the broker's man.

Hon. Bertie de Montmorency—Gertrude's fiancé.

Giles—a footman.

Scene—The Stony-Brokes' drawing-room in London.

Time—The present.

The parts of Mrs and Miss Stony-Broke were played by seamen. Mrs Stony-Broke appeared in black satin and a shawl, and the fair Gertrude in an evening-dress of pale yellow. Both mother and daughter were very shapeless, while their home-made wigs, white cotton gloves, bare red arms, and enormous feet brought tears of joy to the eyes of the audience. So did the gallant General Sir Thomas Dammit, who, it would seem, made a habit of wearing his full-dress uniform, cocked hat, and sword on all occasions.

Mr Hardcash, the villain of the piece, was loudly hissed ; while his emissary, Mr Theodore Buggins, a truly dissolute fellow, became hilariously intoxicated at Mr Stony-Broke's expense. But everything ended happily. Gertrude and the Hon. Bertie plighted their troth, and were duly set up for life with a handsome cheque from Sir Thomas.

The curtain came down amidst scenes of the wildest enthusiasm from the audience, and the orchestra playing Mendelssohn's 'Wedding March.'

When finally the band played 'God Save the King,' Pincher Martin was convinced that it was quite the best entertainment he had ever seen. His shipmates agreed with him.

(Continued on page 358.)

ST PIERRE AND THE WAR.

By AUBREY FULLERTON.

THREE small islands off the south coast of Newfoundland, representing all that is left of the French dominions in North America, will perhaps change owners as a result of the war. They have changed owners some seven or eight times before ; but for the past hundred years France has had undisputed possession. Now they are likely to come back to Britain again.

St Pierre-Miquelon is the name of the island colony that is thus the last remnant of French rule in the New World. Champlain and Frontenac, in their days of empire-building, would have scorned the three little rocks ; but in these latter times France has valued them. She has two reasons : they are an important base of food-supply for the homeland, and they furnish an excellent training-ground for service in her navy.

Till the war came, ten thousand men and boys went every spring from St Malo, Cancale, and other parts of coastal France to exploit the Grand Banks fisheries. They took with them the promise of a liberal Government bounty on every quintal of fish they caught, and the Government also paid the wages of the boys, who were sent out under contract as helpers to the fishermen. The official interest was not altogether paternal, however, for after two or three years of this kind of service the boys were required to enter the French navy, for which the rough-and-tumble life of the North Atlantic fisheries is good apprenticeship. There are men on some of France's warships to-day who got their first training of nerve and muscle on the fishing-smacks off the Grand Banks.

The ten thousand fishermen did their summer's work, and came back home in the fall, leaving the islands for the rest of the year to the resident population of about five thousand people. But when the war broke out it took them away two months ahead of time, for they were reservists, to whom their country's call came as a matter of course. A little later the St Pierrais themselves were told that every able-bodied man was expected to go to France's help. Nearly a thousand men answered this second call, and St Pierre was left to the women and children and old men. The colony, thus deprived of its bread-winners, has been sorely stricken. Bread-winning there means cod-fishing on the Banks, and that alone. There is no farming, for the rock-islands have so little soil that even grass will not grow. With their one industry crippled, the people who have remained are chiefly dependent upon the separation allowances sent to them by the Government of France.

After the war, the St Pierre men who have survived it will be unlikely, it is thought, to return to their hard life as deep-sea fishermen, for which many of them, in fact, will then be unfit. There is a report that France will not repopulate the colony, but will turn it over to Great Britain, receiving in exchange certain permanent fishing rights in the waters thereabout, which will be of quite as much real value to her. Britain probably will, in that case, annex the islands to Newfoundland, which in turn will some day become, it is expected, a part of the Canadian confederation.

The three islands of the colony, St Pierre, Miquelon, and Langley, have together an area of about fifty thousand acres. Only one of the three, St Pierre, is of importance, and it chiefly because of the little city of the same name at its southern extremity. This city is practically the whole colony, and in it is centred a life that is normally as quiet and simple as the world can show; it is a bit of the Old World in the New. The people are unmixed French, except for a

few Englishmen and Americans who are there for business. The town is rambling, and innocent of all things modern except electric lighting; the shops and cafés are of an old European type, and equally so are the townspeople, the priests, the public institutions, and the dogcarts that are driven by Basque villagers.

When the fishing season is over it has been the habit of the St Pierrais to enter heartily into the social life they themselves have made. Away off the world's highroads, St Pierre has lived a life apart, but has managed remarkably well to find some pleasure in it. The social instincts of the people are especially catered for by many cafés, which are gathering-places for all kinds of festivities and neighbourly talks.

The colony has a governor, who administers its public affairs. St Pierre is, in general, law-abiding. Its greatest misdemeanour is smuggling, which is very cleverly carried on with both the Canadian and American coasts, but is not regarded as a serious offence.

Except for the occasional calls of the steamers and a submarine cable that connects with the transatlantic system, there is no communication with the outside world. The people live their quiet, uneventful, but busy life, unknowing of what goes on beyond; but their isolation has bound them closer to one another, and made them as one family.

To this quiet and remote corner the news of war came like a bolt from the blue. The St Pierrais knew very little, if anything, of the original causes and outbreak of the war; but after the storm had burst they heard its distant noise, and gave up their strongest men in response to its call. In proportion to its resources, St Pierre-Miquelon has been harder hit than almost any other part of the Allies' dominions; yet the people are bearing themselves bravely. If finally the colony becomes British, and if then it is more fully modernised, it may be hoped that it will not lose all the quaintness that now gives it its chief attraction.

THE MONTH: SCIENCE AND ARTS.

AN INGENIOUS GAS-COOKER.

THOUGH the familiar gas cooking-stove has been brought to a high standard of perfection, it is apt to be wasteful in fuel unless skilfully managed. In the average stove, including oven and outer rings and grill, there are from one hundred and fifty to two hundred gas-jets, probably all of which are burning simultaneously when a full-course dinner is being prepared. But a distinct part of the heat thus generated fails to perform any useful purpose, for it escapes around the vessels and is dissipated into the surrounding air. An

invention has now been devised to minimise this escape of heat, and to induce the gas-stove to do more work with a less consumption of fuel. The oven itself is abandoned, although if desired it may be employed as an auxiliary. The inventor has brought into operation what may be described as a modern adaptation of the well-known hot-plate. A four-square flat steel plate is laid upon the top of the gas-stove (or on the top of an ordinary gas-ring) in such a manner as to cover the whole of the burners. At the sides of the plate there is an ingenious arrangement of four steel wings, which are deflected at a specially designed angle. The apparatus is also

provided with a number of heat-suction vents, which effect the distribution, equalisation, and conservation of the heat. The superficies of this apparatus is about two square feet, and it is necessary to light only one of the rings. This ring, instead of heating a surface aggregating merely a few square inches, such as the bottom of a saucepan, heats up the whole of the plate; and, owing to the deflecting wings and the suction-vents, heats it up equally, the temperature at the extreme edges being the same as that immediately over the ring. Saucepans placed upon the plate will boil or simmer as readily as if each were placed over its particular ring of lighted jets. Thus, instead of having possibly one hundred gas-jets burning simultaneously, only a single ring of perhaps forty-four jets is alight, and yet it is doing all the work of the hundred, for a much less proportion of the heat is lost in the surrounding air. For baking purposes, a portable oven, also made of steel, and of sufficient dimensions to receive pastry and a joint simultaneously, is placed upon this hot-plate. The heat penetrates into the oven, which is bottomless, and cooks the articles as well and as expeditiously as the ordinary gas-oven, although only a single ring is being used. When the oven is in position, sufficient space is left at one side to enable a couple of saucepans to be placed on the hot-plate, while the top of the oven may be used for heating plates or for keeping warm other foods already prepared. Demonstrations with this apparatus have convincingly proved its possibilities, and have shown how cooking by gas may be carried out with greater economy than is possible at present. The hot-plate heats up quickly, and after the gas is turned down or out it retains its heat for an appreciable period. It is stated that with this apparatus it is possible to reduce the consumption of gas from 50 to 75 per cent. The apparatus is inexpensive, cannot get out of order, and, being fashioned from Bessemer steel, will withstand the hard wear of the kitchen.

A MAGNETIC HAND FOR CRIPPLED SOLDIERS.

The deprivation of a limb is one of the possible penalties of warfare, and it is imperative that every effort should be made, so far as possible, to compensate our fighting-men for the loss of a hand or arm. In this connection the Germans are already displaying initiative, and the magnetic hand is one outcome of their ingenuity. By means of it a number of operations may be carried out almost as effectively as if the wearer were not deprived of his limb. The device consists of an artificial limb strapped to the stump and carrying a magnet, which is fitted with a ball-and-socket movement, so that it may be swung in any direction. The magnet is fed with current through a flexible cord and plug; hence it may be switched on and off as desired. With this device any iron tool may

be lifted up, held, and manipulated, and after a little practice the wearer becomes quite proficient. When the man is accustomed to working in wood, the problem of gripping the tool by the magnet is overcome by attaching to it a small steel plate in a convenient place, so that the tool may be gripped in an almost natural manner. The German scientist who has devised this magnetic hand declares that the idea may be applied to almost any existing tool, and where this cannot be done simple special tools may be cheaply devised. He has thus indicated a wide field for future development in the supply of artificial limbs of such a design as to enable an injured soldier to pursue his normal occupation. The German success in this connection should serve as a stimulant to British brains, that the inconveniences suffered by our crippled soldiers may be minimised to the utmost degree.

A NEW TRENCH STOVE.

Among the many devices intended to improve the lot of soldiers serving in the trenches, an ingenious portable stove commands attention. While the thermos flask has solved the hot food problem up to a certain point, it suffers from its limitations, which are pronounced. In this latest device a brazier is provided. The grate resembles an inverted truncated pyramid, the bottom being formed by a perforated plate, which allows the ashes to escape and ensures the draught necessary for proper combustion. The grate is supported in a square metal frame mounted upon four legs. On being folded up, it packs flat into a space ten inches square, so that it may easily be carried in a haversack. Although of strong steel construction, the stove is light in weight, scaling only four and a half pounds. It can be set up in a moment, and will burn any fuel—wood, coal, coke, or charcoal—with equal facility. It is not only valuable as ensuring hot meals, but is additionally serviceable from the trench soldier's point of view, inasmuch as it offers him a means of keeping warm.

AN INCANDESCENT GASLIGHT IMPROVER.

An invention, having for its dual purpose greater economy in the consumption of gas, together with increased lighting efficiency, has recently appeared upon the market. If we examine a lighted upright gas-burner from which the mantle has been removed, it will be observed that the flame bears toward the centre. Thus it is apparent that when the mantle is in position the greater portion of the gas burns away uselessly in the hollow space, only a fractional part impinging upon the mantle and raising it to imperfect incandescence. The new device consists of a fireclay core, which is slightly tapered and shaped at the top, and is bored from end to end. The fork which supports the mantle is slipped through this core, and thus holds it

in a vertical position, so that when the mantle is placed over it only a narrow annular space is left between the mantle and the economiser within. If the gas is now lighted the flame is deviated from the centre by the core, so as to play completely upon the mantle itself. By forcing the gas-flame outwards in this manner the mantle is raised to a higher degree of incandescence, and consequently more light must be emitted for an equivalent consumption of gas, while the light is diffused from all parts of the mantle in equal degree. If the burner is of the latest pattern it will be found necessary to reduce the gas-pressure. In some cases the tap may be turned half-way, and even then a brighter light is furnished than would be obtained from full pressure if the core were removed; while, of course, the consumption of gas is reduced by 50 per cent.

A HOME WATER-DISTILLER.

Sufferers from rheumatism, gout, and kindred maladies realise the importance of absolutely pure drinking-water. Distilled water is desirable for this purpose, as there is then no risk of the disease becoming aggravated, or a treatment which is in progress being impeded, if not entirely arrested, by impurities dissolved in the water. In order to obtain the most satisfactory results it is desirable that the water should be prepared as required, and a convenient apparatus for achieving this end in the home is now available. It is a small, compact, complete still, wherewith the water is first converted into steam, and then condensed into liquid free from all organisms, lime-deposits, and other impurities. The purifier can be mounted upon a small table, and either a gas-ring or a spirit-stove may be employed for boiling the water. If the apparatus is placed within convenient reach of a water-tap, a continuous yield of pure water may be obtained while the purifier is in operation.

A SIMPLE PROTECTION AGAINST RUST.

The problem of treating small, inexpensive articles with a cheap protector against rust, sufficient to preserve them during the period of transport, is of material importance to the hardware manufacturer. While costly machines destined for distant markets, and passing through varying climes in transit, may be treated with expensive greases, such measures are out of the question when cheap lines of goods are to be shipped. It is, however, equally imperative that these should preserve their pristine lustre until their arrival, as tarnished articles invariably arouse distrust on the part of the purchaser, who may reasonably be pardoned for suspecting that he is buying a second grade of goods. An American exporter has now solved this problem, apparently to his complete satisfaction. He uses a cheap varnish diluted with methylated spirit, the proportion being two or three parts of the

latter to one of the former. Owing to the volatile character of the spirit the mixture has to be prepared as required, and therefore the inventor has adopted a novel method of treating a great number of articles at one time. He takes two oil-drums of varying sizes, and removes one end from each. The smaller drum serves as the container for the articles to be treated, and its bottom and sides are perforated with half-inch holes. The mixture is placed in the larger drum, into which the smaller container, with its charge, is lowered. The immersion is instantaneous, and the inner vessel, after being withdrawn, is held up for a few minutes to drain. The contents are then shot upon a wire draining mat or rack stretched over a table, with a tray beneath to catch any superfluous liquid. In about fifteen minutes the protective coating has hardened sufficiently to permit of the goods being packed. The protective skin which the bright surfaces receive is extremely thin, and is not noticeable unless the articles are closely examined; but it is sufficient to prevent the metal beneath from becoming affected by the atmosphere. In fact, it has been found that articles so treated will retain their original lustre and protective film for a year. Even sea air cannot break through the protective coating. When the articles are in use the film rapidly wears off, revealing the true lustre beneath. The process is simple and inexpensive, one preparation being sufficient for the adequate treatment of several thousand small articles, such as buckles, rings, hooks, &c.

SUGAR AND SWEETS.

There has been some correspondence in the newspapers on the limitation of the use of sugar. Lady Frances Balfour remarked that if the consumption of sugar is restricted, it may prove a direct incitement to the use of less nutritious stimulants, for sugar is a necessity in the child-life of the community and a felt want in the diet of all who do good and strenuous work. Some soldiers at the front, especially where vegetables are scarce, have developed a taste for sweets. Sir Lauder Brunton in a letter to the *Times* distinctly approved of a statement by Mrs Bramwell Booth, in which she said that sweets are a valuable food, especially for children. Further, this eminent doctor said that the nutritive value of sugar is so great that the Germans, some years ago, added it to their soldiers' rations. In addition to this, sugar renders palatable food which might otherwise be insipid, or even distasteful; and it has been shown by the distinguished Russian physiologist I. P. Pavlov, whose recent death we greatly deplore, that food which pleases the palate is much more digestible than food which is insipid. Sweets have the additional power of appeasing a craving which is sometimes felt, even after a full meal, a fact which is usually recognised by their being placed on the table along with dessert after a public dinner. They

satisfy also a vague desire which is sometimes felt at other times, and instead of leading to indulgence in alcohol or tobacco they supply their place. Over-indulgence in sweets between meals, especially by children, is apt to lead to indigestion; but sweets taken along with, or just after, meals are of advantage. As sugar when converted into beer or spirit loses most of its nutritive power, the doctor is of the opinion that it is a much greater economy to the country to keep sugar in its own form than to convert it into beer.

WAR-TIME GARDENING.

A practical gardener writes that one of the most profitable crops for the small holder to grow is the sunflower. The plants should be sown in pans in April, and transplanted, twelve inches apart, in rows fifteen inches from each other. They can also be grown by sowing the seed in the open. As soon as the plants appear the ground should be well hoed. When they are eighteen inches high cut off the leaves up to twelve inches. Wire net about a rod of the ground, then put in a brood of ducks. The shelter from the sun afforded by the broad leaves will be most beneficial to the ducks, which will keep every weed down and manure the crop at the same time. It is advisable to shift the water-pan every four days, as the ducks naturally make a habit of congregating near it. The reason for cutting off the leaves is that if they are left on, one young duck will pull the plant down, and another will eat the top off. The plants will thrive wonderfully from the manure of the ducks, and will produce about double the crop. The outside leaves can be chopped up with weeds from the garden, wetted, and a little meal sprinkled over them. This mixture makes a very good feeding-stuff, and thus ducklings worth a shilling each will be raised at very little expense, and a supply of good sunflower-seed will be at hand for food for fowls during the winter. Moreover, the land will be in fine order for an onion-bed next season.

MODERN EXPLOSIVES.

We regret that in the article 'The Romance of Modern Explosives,' printed in *Chambers's Journal* for November 1915, the author made no mention of the part taken by Sir Hiram Maxim in connection with smokeless powder. The versatile inventor's own account of how he came to take up the matter is distinctly interesting: 'In the early days of the Maxim gun I was invited to give an exhibition at Pirbright in the presence of Lord Wolseley and other high officials. When I had fired three hundred and thirty-three service cartridges in exactly half-a-minute there was an immense cloud of smoke. Lord Wolseley said, "Maxim, unless you can give us a smokeless powder your gun will be of little use." I commenced at once to study the

subject. I purchased all the books I could find on high explosives, and in 1887 I had succeeded in making a smokeless powder that did fairly well. This was the subject of several patents, the principal one being No. 16,213 of 8th November 1888. In the early summer of 1888, having received a large number of orders for Maxim guns, and finding my little shop in Hatton Garden altogether too small, I took large premises at Crayford, and moved into a house near the works. In order to continue my powder experiments upon a more advantageous scale I established two laboratories—a fairly large one close to the gun-works, and a small one near my house where I could work in the evenings. It is a fact that the powder which I made at that time has never been excelled, and that it is the standard powder of the world to-day.' It was this patent that enabled the Government to beat Nobel in the great cordite case, in which it was decided that Sir Hiram S. Maxim was the original inventor of that class of smokeless powder known as cordite, which is still used by the British Government.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A LULLABY.

BECAUSE some men in khaki coats
Are marching out to war,
Beneath a torn old flag that floats
As proudly as before;
Because they will not stop or stay,
But march with eager tread,
A little baby far away
Sleeps safely in her bed.

Because some grim, gray sentinels
Stand always silently,
Where each dull shadow falls and swells,
Upon a restless sea;
Because their lonely watch they keep,
With keen and wakeful eyes,
A little child may safely sleep
Until the sun shall rise.

Because some swift and shadowy things
Hold patient guard on high,
Like birds or sails or shielding wings
Against a stormy sky;
Because a strange light spreads and sweeps
Across a darkened way,
A little baby softly sleeps
Until the dawn of day.

G. R. GLASGOW.

*. * TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible. ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

SEVENTH SERIES

CORPORAL MARGUERITE.

By CLIVE HOLLAND, Author of *A Madonna of the Poor*, &c.

CHAPTER I.

THE Germans had come. A whole regiment of the gray-coated invaders had swept down the valley of the Marne towards Paris, devastating picturesque and peaceful villages, terrorising, slaying, outraging the inhabitants, and crying out loudly, as they tramped along, 'Paris! Paris!' The very walls of the little inn of Armand-sur-Marne, which stood at the southern corner of its single cobbled street, had been shaken to their foundations by the concussion of artillery fire.

Old Grandpère François, who, with his son's wife and daughter, saw after the little inn now that his son had gone to join the flag, had known something of the war of '70. Then German soldiers had come to the little, smiling village; but, as he said when the new hordes had passed, 'They in '70 were soldiers, and not savages.'

Grandpère François's daughter-in-law, Madame Baudet, was a woman of five-and-forty, buxom, alert, though inclining to stoutness, and with a 'business head,' as Henri Baudet, her husband, was wont to declare, 'second to none in the village.'

Marguerite Baudet, her daughter, was nineteen years of age, and by common consent the prettiest girl in Armand. Above middle height, with a well-developed figure and a wealth of the corn-coloured hair which is found on the heads of some of the girls of this district, and clear blue eyes, she was quite strikingly handsome.

When the Germans had come, after French regiments in full but orderly retreat had passed through the village, retiring before the enemy on Paris, Marguerite had hidden herself in the loft at the back of the inn where apples, potatoes, and other produce of the kind were usually stored for the winter. Marguerite's mother had heard tales of what had happened to girls like Marguerite in other villages, and so she hid her away, and the Germans passed by without having caught even a glimpse of her, although they overran the guest-rooms of the little inn, drinking all the wine in the cellar, even to a few bottles of champagne and fine cognac which had been there ever since Grandpère François had succeeded his father as proprietor.

After the Germans had gone, the village and its inhabitants made a brave struggle to believe that the tide of war had passed them, and to carry on their usual vocations much as before that August day when like a thunderbolt had come the news that France was at war. In the fields round Armand, especially those which stretched down to the placidly flowing river, harvesting was continued, the workers little knowing that the crops they cut would be seized from them almost before they could be tied into bundles and carried to the stackyards.

Then one day there came hurrying to the village a German scout, who told the *maire*, who was by trade a cobbler, and Grandpère François—the two most important men in Armand save M. le Curé—that at sundown a regiment would be in the village, and food and lodging must be found. Even as he spoke, in quite excellent French, to M. Carpentier, the *maire*, and Grandpère François, in the sunlit street outside the little inn, the 'Coq d'Or,' the rumble of heavy cannonading came, borne to them on the north-westerly breeze.

It was not a retreat, according to the German. Oh dear, no! They were merely detaching a certain force from the main army under the command of Von Kluck to guard against any outflanking movements or an attack in the rear. The speaker might have told old Carpentier and Grandpère François any other story; for so long as military phraseology was used neither of them was likely to grasp the true significance of what he heard. The thing that concerned them was that by six or seven o'clock the village would be in the hands of the Germans. Of that there could be no doubt; and every bit of food that had been left when they passed through Armand a little more than a week before would now be seized.

'See to it,' said the scout, ere he mounted his motor-cycle to flash away down the road towards Chalons, 'that everything is in order, messieurs, or I will not answer for what may be done to you and your village.' Then he added, with a cynical smile on his handsome boyish face,

'Men have been shot and villages burned for less crime than the failure to provide food and lodgment for our soldiers.'

As he disappeared down the road the faces of the two men to whom he had been talking became grave.

'What can be done?' said old Carpentier, seizing hold of Grandpère François's hand with his own horny palm, and holding it firmly. 'There is little enough food in the village now, and if these locusts come, what is going to happen?'

Grandpère François shook his head until one of the locks of his long white hair came tumbling over his brows, and he had to thrust it back. 'The good God only knows!' he replied; 'but better give them everything than have our houses burned down and our women seized.'

And so the two old men hurried from house to house warning the inhabitants that they should gather together all the food possible for the hungry men who would before sundown be clamouring at their doors. 'And offer no resistance to their demands that can be honourably met,' was the keynote of the instructions issued by Carpentier.

A pall of misery seemed to have fallen upon the village. The Germans were coming again. The hated invaders of France would once more clank their way down the cobbled street, pushing open or battering in doors, and possibly ransacking the houses and carrying off anything that took their fancy, insulting the women, ill-treating the men, increasing tenfold the hatred with which they were already regarded. It was terrible. 'What were the soldiers of France doing that such things should be?' And to questionings such as these Grandpère François could only reply, 'Patience, my children. The sons of France are doing their duty. Is it not that the Germans are being driven back from off our sacred soil that the invaders are about again to pass by here?'

But to frightened women and children the speaker's explanation and exhortation brought little comfort.

And so the afternoon passed in preparations and lamentations, with the thunderous roar of artillery growing ever louder and louder as the hours and minutes crept on. Frightened beyond endurance, some of the women and children sought refuge in the little wood which lay on the far side of the village, and was approached through several cornfields. There, at least, they thought, they would be safe, hiding in the undergrowth, and now and then furtively peering forth from the hillside to see if the enemy had come. Those who had not fled just waited and waited in or outside their houses, listening with ears rendered preternaturally keen by anxiety for the sound of approaching men.

CHAPTER II.

Just as the sun was sinking in the west the advance guard of the 45th Bavarian Regiment appeared over the crest of a slight rise half a mile along the road to Paris. A few minutes more and the whole regiment blocked the street. Houses were entered, food was seized, and an orgy of pillage commenced. They were famished, were these Germans; and, notwithstanding what the scout had told the *maire* and Grandpère François earlier in the day, the travel-stained, dusty, and in some cases wounded men who crowded the little houses and sat or lay about in the streets knew that they had been beaten back. How far the disaster was general they did not know; for in that titanic struggle within fifteen miles of Paris one only knew, indeed, what was taking place in one's own immediate neighbourhood.

The officers came to the 'Coq d'Or,' demanding a meal, 'as though,' as Madame Baudet put it, 'you could make an omelette out of cobble-stones, and soup out of pump-water.' And then, finding the food was scant and the supply of wine confined to half-a-dozen bottles or so which had escaped the notice of their comrades who had passed through Armand when the army, of which they formed a part, was advancing on Paris, two of the younger men set out to raid the premises.

As they crossed the yard, their heavy boots clanking on the flags, and came towards the apple-loft, Marguerite, who had fled there an hour before, heard them, and hid herself deeper amid the trusses of straw which had been got ready for laying down the apples later in the month.

'Surely,' she thought, 'they will not discover me. They will not trouble to climb the ladder into the loft;' and she lay holding her breath to listen.

They came to the door and shook it—she knew it was not locked—and a moment later she heard the click of the lifted latch. Then a moment or two later, and she heard the scrapings of some one's feet upon the rough ladder which led up into the loft itself, and a voice in a foreign language spoke. Another voice down below seemed to be expostulating with the person who was climbing, but the other only laughed and called out something in reply. And then she heard the creaking of the boards as the climber stepped from the ladder on to the floor.

The German paused a moment. The voice from below called out, 'What is it? Is there anything?'

'Nothing!' was the response, coupled with a coarse oath. 'Only a few bundles of straw.'

'That all?' cried out the voice from below. 'Well, chuck them down. Isn't there a door

somewhere? We may be glad of them to sleep upon.'

The girl behind the straw was holding her breath till she felt almost suffocated. She trembled lest the beating of her heart, which sounded in her ears as loud as the tapping of a hammer, should betray her. She heard the intruder go to the side of the loft, fumble with the bolt which secured the doorway, and then pull the door back, flooding the dusty chamber with the golden-red beams of the setting sun. Next the footsteps came creaking across the floor, and one of the bundles was dragged away towards the door, and she heard it fall with a rustle and a soft thud into the yard beneath. Then another bundle was pulled away, and she was conscious that her foot was exposed.

'*Mein Gott!*' she heard the intruder exclaim, as he walked away across the floor and called out down the hole through which the ladder came, 'Come up, Hans. I have found something, after all.'

There were sounds of some one scrambling hastily up the ladder, the boards creaked again, and another truss of straw was pulled hastily away. In a moment the remaining trusses were pulled off and thrown back towards the loft door, and the trembling form of Marguerite was disclosed to view.

The two men paused and stared at her. The one who had first come into the loft was a tall, fair young fellow of four or five and twenty, whose dusty, dishevelled uniform could not disguise the fact that he was a gentleman by birth. His companion was of a rougher type, though also an officer. He was the first to recover from his astonishment.

'A perfect Venus!' he exclaimed; 'and found in an apple-loft! We're in luck, Eitel, my friend. There was nobody to wait on us but that old woman in the inn; here we have just the waiting-maid that will please us all—the colonel included!' he added with a laugh that was not pleasant to listen to.

Then the speaker stooped down and pulled the girl roughly to her feet. She shrank from his touch as though it were something foul and contaminating.

'Ho! ho!' he said, 'is that the way you would treat a gentleman?' And he seized her again and kissed her roughly.

In a moment all the spirit of a French girl, all the fire that lies sleeping in the women of her race, all the hatred instinctive and national for the Germans, sprang into being, and she drew her nails down the side of the man's face, leaving scratches which might have been made by a wild-cat.

For a moment Lieutenant Hans Hofmeyer was disconcerted. Then for another moment his face flushed a deep red, and for just a fraction of a second the girl's life trembled in the balance.

But his companion, Eitel Beyerlein, laid a

restraining hand upon him. 'Don't hurt her,' he said. 'She's a wild-cat, my friend, I admit, but a beautiful one, and we have means—eh?—of taming the wildest of them.'

Hans Hofmeyer said nothing, but stood glaring at the girl, whose face was very white now, and whose limbs trembled. Then, feeling a thin thread of blood trickling down his cheek, he took out a dirty handkerchief and dabbed his face.

It was his companion who spoke again. 'I will go down first,' he said, 'and then make the girl come down. If she slips I can catch her. Then you come last. With the two of us she can't play any tricks.'

'Good!' said Hofmeyer; and as his companion went towards the little hole in the floor to descend he took hold of the girl's wrist roughly, and dragged her towards the opening. 'Down you go!' he said, hardly able to resist the temptation to expedite her movements with a kick.

When Marguerite's fair head had disappeared down the ladder, the man followed slowly.

Dragging the girl between them, the two men crossed the yard and entered the large room of the little inn, now thick with tobacco-smoke, where already the colonel and several other officers were sitting drinking the few bottles of wine that had been found for their enjoyment, waiting the while the serving of the meal that Madame Baudet was hastily and tremblingly preparing in the little kitchen.

'Here we are!' called Beyerlein, as he pushed the door open with his foot. 'Here, colonel, is a Hebe or a Venus, whichever you like, to wait upon us. And a spitfire, too—look at Hofmeyer's face.'

The colonel turned his heavy gaze upon the trembling girl. The younger men sprang to their feet with a shout of 'Bring her in, and let's have a look at her!'

'A perfect beauty!' exclaimed one.

'Just the girl I've been looking for!' said another.

'How much will you take for your capture?' shouted a third.

And then there ensued a babel of tongues, all speaking rapidly in German, discussing Marguerite and what should be done with her. Happily, she knew not a word of the language they used, though she guessed something of it from their gestures and the looks that they threw at her.

At last the colonel, to still the noise, banged on the table with his cup, which was half-full of wine, slopping over some of the ruby fluid. 'Never mind what you'll do with her,' he called out gruffly. 'Send her now to hurry that old beldame with the meal. I am hungry,' he went on, 'and I'm not going to wait all night for something to eat.'

'You can go,' said Beyerlein, addressing her in French, and loosing his hold on Marguerite. 'Tell the woman to hurry up, or it'll be the

worse for her. The colonel is not accustomed to be kept waiting, and we have had nothing to eat since we left Dormans this morning.'

Tremblingly Marguerite left the room, the smoke-laden atmosphere of which caused her to feel half-suffocated, and hurried away down the little passage to the kitchen.

As she pushed open the door her mother turned round from the fireplace with a start of alarm. 'You, my child!' she said. 'What are you doing here? Go and hide lest the cursed Boches see you.' And then she saw that Marguerite was very pale.

'Alas, *maman*!' she exclaimed, 'it is they who have discovered me and dragged me from my refuge, and have sent me to tell you to hurry with their meal, or terrible things will happen. Here, let me help you;' and the girl crossed the floor to where her mother stood.

The meal, when it was served, was prolonged, and Marguerite was not allowed a moment's cessation from waiting upon the unwelcome guests. These German officers, accustomed almost to a man to the life and the *habitués* of the great and notorious Palais de Danse in Berlin, subjected Marguerite to a cross-fire of coarse chaff and even coarser praise of her good looks till the night was far advanced, and the girl almost dropped with fatigue whilst serving them. She summoned to her aid all the innate courage and endurance of the healthy French peasant girl. She would not give in, for the longer they sat and drank and joked and smoked,

and even insulted her with their coarse jokes, the greater chance there was of her escape from more terrifying evils.

At last the colonel exclaimed thickly—for the wine he had drunk was far more bemusing than the light beer of his native land—'*Donner und Blitzen*, gentlemen! if we are to get sleep to-night we must snatch it now. Who can tell but those cursed English or the French may wake us before dawn?' and then he gazed steadily at Marguerite, who stood trembling, leaning up against the jamb of the door leading into the passage, waiting further orders.

There were already dark lines under her eyes, and her whole figure had a dejected mien, arising from fatigue and the violent emotions of the last few hours. Her mass of fair hair, never easily confined by pins or plaits, now tumbled down over her shoulders in a cascade of gold, upon which the light from the lamps shone.

Beyerlein, who had kept one of the soberest of the younger men, rose suddenly and went towards Marguerite as though to speak to her, but she fled, terrified, down the passage, and vanished.

As she disappeared the colonel said, 'At six to-morrow, gentlemen, if not before, we move on towards Rheims.'

And with these words, one by one, led by the colonel, they filed from the room, Hans Hofmeyer stumbling blindly over a chair, and cursing volubly as he picked himself up off the floor.

THE CAT.

By Professor HERBERT A. STRONG.

IF we could transport ourselves back to the time of the early Roman Empire, and be permitted to have the *entrée* to a Roman household, we should probably be astonished to find that most of the domestic animals which we possess were even then possessed by our hosts. But we should look in vain for one animal which moderns expect to find in nearly every house; and it may be that we do not all suspect that the little animal whose presence seems to us a necessary adjunct to almost every home is a comparatively late arrival in Europe.

The cat, with its mysterious ways, with its inscrutable look, came to us from the valley of the Nile, and is a legacy from that mysterious and interesting people, the ancient Egyptians. We are expressly told by ancient Greek authors that the Egyptians reared cats in vast numbers, that they regarded them as sacred, and that they embalmed and mummified them after their death. Even had written evidence been wanting, monuments, inscriptions, and actual mummies would have told us the same tale. A few years ago a regular cats'

cemetery was dug up near Fayoum, and cart-loads of these animals were despatched to Liverpool to be used as manure. Some fell into the hands of professional zoologists, and aided them to guess at the species of cat reared by the ancient Egyptians, which is now considered to be the *Felis maniculata*. Diodorus bears witness to the veneration in which these animals were held by the Egyptians, in relating an occurrence which he himself witnessed. Although it was the policy of the Romans to leave complete liberty to every nation which it conquered to worship in its own way, it happened sometimes that accidents would happen which might lead to a contrary conclusion. The Egyptian Government wished above all things to remain in Rome's good graces, and to avoid offending a people who inspired such terror and who wielded so much power. But a certain Roman happened by accident to kill a cat. The mob instantaneously gathered to avenge the death of the sacred animal, and surrounded the house of the guilty murderer of their favourite, and no effort of King Ptolemy or his officers,

no fear of the Romans, was able to save his life.

We may guess from the very untamable nature of most of the *Felidae* the length of time which must have been necessary to domesticate these animals. Hundreds of years must have passed, and endless perseverance and kindly handling must have been demanded to tame them as perfectly as they are tamed. In this case, as in some other cases, superstition has had a benign and not a baleful influence upon civilisation. Egyptologists consider that the cat was introduced originally into Egypt from the South, and that the credit of domesticating it belongs entirely to the inhabitants of that country.

It is fortunate that the cat found its way into Europe at the time of the Roman supremacy, which, like other polytheistic systems, was in religious matters at least tolerant; had it been confined to Egypt till the iconoclastic intrusion of the Moslems, it might have been extirpated as a pagan object of worship. The Egyptians seem to have kept their cats in vast enclosures, and it is perhaps a trait of heredity which causes them to remain so faithful to a house in which they are domesticated.

The cats of Alexandria were looked on as so many images of Neith, or the Pallas of Saïs, a goddess worshipped both by Greeks and Egyptians, and it passed into a proverb with the Greeks, when they spoke of two things being unlike, to say that they resembled each other as much as a cat resembled Pallas. It is to Alexandria that we trace the story of a cat turned into a lady to please a prince who had fallen in love with it. The lady, however, when dressed in her bridal robes, could not help scampering about the room to catch a mouse seen upon the floor; and when Plutarch was in Egypt it had already become a proverb that any one overdressed was as awkward as a cat in a crocus-coloured robe.

Whenever a house caught fire the chief care of the neighbours was to save the cats; the men and women might be burnt in the ruins, but the cats were to be saved at all risks. When a cat died a natural death every inmate of the house shaved his eyebrows, and when a dog died they shaved all over. No doubt the attachment of the Egyptians, which grew into a superstitious reverence, for the cat arose from its utility as a vermin-killer. Now the Romans and Greeks felt the necessity also of some animals to kill mice, which seem sometimes to have appeared in vast numbers, as we have seen them do in modern times. We have even notices of entire village communities having been obliged to migrate on account of these pests, which are well called by a name which in most Aryan languages signifies 'the micher,' a 'stealer.' It may be noted that the Romans were free from rats, which seem to have come into Europe from the East somewhere about the third century of the Christian era,

and it is most probable that the cat was introduced from Egypt to combat these animals. A few rats may, of course, have been introduced at an earlier date by trading-ships, and a few cats may have been introduced as curiosities to be exhibited with other wild animals at the games, but they were certainly not generally known. The Romans and Greeks domesticated some species of weasel, just as we in India domesticate the mongoose in order to cope with the plague of mice; and they called this animal by the name of *mustela*, *felis*, and *melis*.

Consequently, where we in stories, fables, or allusions should expect to meet with references to the cat, we find instead, in the classic writers, references to the weasel. The Mouse in the *Batrachomachia* says to the Frog, 'I fear more than anything on earth the weasel, the strongest of beasts, who can even creep into my hole.' In Aristophanes one speaker says, 'Tell me a story.' 'Good,' says the other; 'here is one for you about a mouse and a weasel.' In Plautus a speaker says that he has just seen a weasel catch a mouse in the house. In the well-known fable cited by Horace of the town and country mouse, it will be remembered that the town mouse treated his friend from the country to a sumptuous repast consisting of the remains of the overnight supper, and then laid him to rest on purple coverlets; when, presto! the doors fly open with a clatter, dogs' barks are heard, and the country mouse politely takes his leave.

There is in the Pompeian Museum in Naples a mosaic representing a cat killing a quail, but it is generally agreed that this is the representation of a wild-cat. At last we find in Palladius, who wrote a treatise on agriculture probably early in the fourth century, when the days of the Western Roman Empire were numbered, mention of our house cat under the name of *catus*, a name which, like the animal itself, has passed into most of the civilised and many of the half-civilised nations of the world. Palladius says that it is advisable to keep '*catos*' to keep down '*talpas*;' by the last word we must probably understand what the Italians express by the word *topo*, which is used either for rats or mice. Now we know that rats came to Europe from the East, and indeed this tradition is preserved in language; the modern Greek calls the rat 'the Pontic' mouse; the Welsh and Irish call it the 'French' mouse. The name *ratte* is found in old German glossaries and in the Anglo-Saxon of Ælfric in England; though it is not mentioned by writers on natural history till the time of Albertus Magnus, about the year 1200 A.D.

We know that enormous numbers of rats sometimes make their appearance quite suddenly, and after walking in long processions disappear mysteriously and suddenly. This is well known in the case of the Norwegian lemming or hamster rat; but a similar fact is recorded with respect to the *kiore* rat of New Zealand. A

few years ago such a visitation of rats occurred on the west coast of the Middle Island. A countless swarm of these little creatures travelled southward along the shore for a distance of more than one hundred and fifty miles. The procession kept always to one direction, as if impelled by some unseen motive, and allowed no obstacles to interfere with its progress. Many died of hunger on the way, and the moving host was exposed throughout its journey to attacks by the imported Norwegian rat, which is stronger and fiercer than the *kiore*, and has almost succeeded in exterminating our native black rat. They suddenly disappeared as mysteriously as they had made their appearance, and no one knew where their journey ended. Perhaps the most remarkable circumstance connected with this strange migration is that its members consisted wholly of males, not a single female being found among them. This migration is described at greater length in Edward Wakefield's *New Zealand After Fifty Years*.

Philology comes to a certain extent to our aid in helping us to follow the wanderings of the rat. It must have come into Europe at a time when the Slavic nations had already split up into different divisions, for the Poles and the Russians have different names for the rat. The Russians call the mole by the word *krot*, which seems to be an adaptation of the old German *rato*. It seems, then, most likely that cats were imported in numbers from Egypt to deal with a large incursion of rats from the East. These rats were in all probability those which we know as the British black rat, which, as noticed above, was attacked by our well-known foe, the *Mus decumanus*, the bearer of the rat flea which carries plague germs. This animal appeared early in the eighteenth century on the lower reaches of the Volga, and made its way mainly on ship-board into western Europe, whence it has been imported into the New World, and indeed to most of the countries of the world.

In the Middle Ages witches and sorcerers were fond of assuming the form of cats; their mysterious movements and their eyes that glisten in the dark may well have been the cause of this legendary transformation. A German legend tells how a miller's assistant spied a large cat

entering his mill. Failing to scare it away, he brought a stick down on its forefoot, and it fled, squeaking horribly. Next day he remarked that his wife had a bruised arm, and it turned out that she was a witch who had taken the form of Grimalkin. The story reminds us of the werewolf in Petronius who suffered in the same way. The origin of the word 'puss' is unknown. In German the pet name answering to 'puss' is *Miezchen*, a diminutive of Marie, and in Russian *Waska*—that is, little Basil—or *Mischka*, little Michael. Grimalkin is probably from gray-Malkin; Malkin being a pet name for Matilda or Maud; so the French *motou*, a tom-cat, is probably from Mathieu.

It is perhaps worthy of note that until lately, as Mr Lane in his book on the modern Egyptians notices, houseless cats were fed in Cairo at the expense of the *kadi*. Every afternoon a quantity of offal was brought into a great court, and the cats were summoned to eat. It would be interesting to know if this merciful trait in the character of the Moslem successors of the ancient Egyptians is a legacy from the old superstition which saw in cats something divine.

The cat seems to have been known in Greece at a very early age, if we may trust the evidence of two daggers discovered at Mycenæ. The blades of these are most skilfully inlaid with gold and silver and a dark substance on a ground of enamelled bronze. A scene is depicted on one of these which seems to represent cats hunting ducks amidst the papyrus on the banks of a river which appears to be the Nile. The Egyptian sportsman, when he went out fowling or fishing among the marshes, took with him, together with boomerangs to kill birds, a trained hunting cat to retrieve them; the cat was also probably trained to catch fish for its master. Visitors to the British Museum will see a wall painting in Case I. in the Third Egyptian Room representing such a scene. The Egyptians called the cat *mau*, evidently an onomatopoeic word; the cat-goddess was called *Bast*. Their affection for the animal is shown by the fact that a pet name used by them for a child was *mai-she-ravi*—that is, little pussy-cat. A toy, too, may be seen in the British Museum (Room IV.) representing a cat with a movable lower jaw.

PINCHER MARTIN, O.D.

A REALISTIC STORY OF THE INNER LIFE OF THE ROYAL NAVY.

By TAFFRAIL, Author of *The Bad Hat*, *The Decoy*, *An Eye for an Eye*, &c.

CHAPTER IV.—THE STRENUOUS LIFE.

I.

TWENTY-FOUR hours later the *Belligerent* was at bleak, wind-swept Portland; and during the next fortnight Martin began to realise what life in the navy really meant. He

fondly imagined that he had been hard worked at Portsmouth, but it was mere child's-play compared with what went on when they were with the squadron.

The anchorage was full of men-of-war. First came seven other battleships precisely similar to the *Belligerent* herself, squat, ponderous-looking vessels, with piled-up superstructures and heavy gun-turrets which gave them an aspect of strength rather than of speed. They were commanded by a vice-admiral, who flew his flag in the *Tremendous*. Next came an independent cruiser squadron of four sister-ships under the orders of a rear-admiral. They were long, lean craft, with four funnels like factory chimneys, and raking masts. They had an ungainly appearance, but looked fast. Then came a couple of light cruisers, slender, graceful vessels, with beautiful lines. They, too, had four funnels, and gave the impression that they were fliers, as indeed they were. Innumerable black destroyers, with another light cruiser as their flagship, lay in glorified sheep-pens jutting out from the shore. They were evil-looking craft, and could do their thirty knots with ease.

But the ships were not always in harbour. Most days of the week they spent outside the breakwater, indulging in what was officially known as 'aiming rifle practice.' It meant that 1-inch or .303-inch aiming rifles were placed in all the guns, and that the ship steamed past a minute target, firing as she went. It kept the gunlayers and guns' crews proficient, for the weapons were worked, aimed, and fired exactly as if they had been using their proper ammunition. Unofficially, this practice was known as *piff*, from the feeble sound of the reports.

Sometimes the whole battle-squadron went to sea for steam tactics under the orders of the vice-admiral; while at least one night a week was spent somewhere out in the Channel without lights, to give the destroyers practice in making torpedo attacks under war conditions.

It was all very wonderful to Martin; but what impressed him most was the way in which the entire squadron of eight battleships steamed about as a whole. Each vessel remained at precisely the same distance from her next ahead, until it seemed as if they were all joined together by some invisible string, rather than free units capable of independent motion and movement. How they managed to achieve this result he could not imagine. It savoured of necromancy. He did not know until later that on the bridge of each vessel was a young lieutenant with a sextant, whose duty it was to measure the angle between the masthead and the water-line of the next ship ahead. Briefly, if the angle grew larger it meant that the ship was drawing up on her next ahead; if smaller, that she was dropping behind; and the revolutions of the engines were accordingly decreased or increased to get her back into her correct position. 'Station keeping!'—the officers of watches would have laughed if they had been asked how they did it. 'My dear chap, it's as easy as falling off a log. Any fool could do it.' Perhaps he

could; but then there are fools and fools. Some of them are wise fools.

Steam tactics, too, were very impressive. The eight battleships would be steaming along in two ordered columns of four ships each. A string of gaily coloured bunting would suddenly appear at the flagship's masthead, to be repeated by the rear-admiral leading the other line. Hardly had the flags blown out clear than every other vessel would be flying a white-and-red 'answering pendant,' meaning 'I have seen and understood.' The flagship's signal would come down with a rush, and after a brief interval of suspense every ship would be swinging round under the influence of her helm. They formed single line ahead, line abreast, and quarter line, each gray ram cutting the water at precisely the same distance from the next ahead. Now and then they broke off into pairs. Sometimes they circled round in succession, each vessel following dead in the wake of her leader. Occasionally they wheeled, the pivot ship reducing her speed, the wing ship increasing, and the intermediate vessels adjusting the revolutions of their engines until every foremast was exactly in line. They twisted themselves into knots, and unravelled themselves again. The effect was really rather wonderful. The squadron seemed to manoeuvre this way and that with the same ease and flexibility as a company of well-drilled soldiers.

It must be very difficult, Martin concluded; but he wondered vaguely why the admiral should take it upon himself to act the part of a glorified drill-sergeant. He did not know that flexibility of movement and ability to change formation with rapidity and precision are even more important in a squadron at sea than with a regiment ashore.

The admiral, experienced officer though he was, was merely accustoming himself to handling his squadron as a compact and organised whole against the time when he might be called upon to do it with an enemy's fleet looming up over the horizon. Moreover, no two ships are ever handled in quite the same way, and he was giving his captains—who, provided they lived, would be admirals themselves one day—an opportunity of learning the ways and tricks of their several ships, so that, when the time came, they should not fail him. Practice makes perfect, even with such gilded potentates as admirals and captains.

The destroyer attacks after dark, too, were very spectacular. The long winter nights were usually overcast and very dark, and the squadron would be steaming without lights; but even then the lynx-eyed young gentlemen on the bridge would not admit that they had any real difficulty in keeping station. They were used to it. On such occasions the men kept their watches, and the lighter guns and the searchlights were manned exactly as they would be in war. Martin, being an ignorant new-comer, found

himself detailed as a bridge messenger; and there, in the very nerve-centre of the ship, he had an excellent opportunity of seeing everything that went on. He never forgot the first destroyer attack he ever saw.

Looking ahead, he could just see the next ship as an intense black blur against the lighter darkness of the sky and sea. Astern came another ponderous mass. The intervals seemed dangerously close, but the officer of the watch showed no anxiety. On the contrary, he stood at the standard compass on the upper bridge, using his binoculars every now and then, and giving occasional muffled orders in a calm voice through the voice-pipe communicating with the man stationed at the engine-room revolution telegraph below. Even the captain and the navigator, who were up there as well, did not seem to be taking things very seriously, though in reality they both had their weather-eyes very much lifting, and were using their glasses constantly. They were always on very friendly terms, and were carrying on an animated conversation about nothing more important than—golf!

'Well, sir,' Colomb was chuckling, 'if your putting hadn't been so bad you'd have knocked me endways. You were shocking on the greens.'

'Yes; but you wait till I get used to that new putter of mine,' the skipper returned, not in the least offended. 'I botched every single putt, and if I hadn't done that——Hallo!' he suddenly broke off, sniffing; 'd'you smell that?'

'That' was a pungent whiff of crude petroleum floating down from windward, and Captain Spencer knew well enough that it meant the attacking craft were somewhere fairly close. The greater number of modern destroyers consume nothing but oil-fuel in their furnaces, and in a strong wind the reek of its burning can often be smelt for several miles.

'M'yes. They're pretty close, sir,' Colomb agreed.

'Keep your eyes skinned, officer of the watch,' the captain cautioned, busy with his own glasses. 'Warn the group officers and guns' crews!'

'Ay, ay, sir,' said the lieutenant, pressing a push by his side, which caused an alarm-bell to sound at all the anti-torpedo-craft guns throughout the ship.

For some minutes there was silence, broken only by the humming of the wind through the rigging and the liquid plop of breaking seas. But all the time the smell of oil-fuel became gradually stronger; and then, quite suddenly, the flagship—two ships ahead—switched on a searchlight. She had seen something!

The powerful blue-white beam flickered out, swung round slightly, and then fell on a black phantom shape rushing through the water. She was a destroyer, and came along with the wind and sea dead astern; but even then sheets of

spray were flying over her low decks and bridge.

Martin held his breath.

The moment the attacker was lit up by the ray there came the loud crash of a gun, and an instant later more searchlights joined the first.

Boomp! Bang! Boomp! Boomp! went the guns in an irregular volley, as the first and second ships in the line got to work. Sharp stabs of red flame danced in and out of the beams of the lights. The thick smoke of the blank discharges wreathed and eddied through the rays as it drifted down the line on the wind; but the destroyers—two of them—still came on at full speed, pitching and rolling horribly.

They seemed to be about six hundred yards on the starboard bow of the flagship, travelling down the line of battleships in an opposite direction to that in which the latter were steaming, and so brilliantly were they illuminated in the glare that even the figures of the men crouching on deck round the torpedo-tubes were clearly visible through glasses. The water was washing knee-deep over their decks as they rolled, but it was not until they were nearly abeam of the flagship that a ball of red fire shot up into the air from each of them. This indicated the moment at which, if it had been the real thing, their torpedoes would actually have been discharged.

'That pair were sunk all right,' muttered Captain Spencer, watching them through his glasses as they swept past barely three hundred yards off. 'They were under fire for quite half-a-minute before they let go their torpedoes. Poor devils! they're having a pretty rotten time. Great Scott! just look at that sea!'

The leading destroyer had put her helm over to alter course outwards. It brought her nearly head on to the sea, and she had shoved her nose straight into the heart of an advancing wave. It was not really rough, as seas go, but the speed with which she was travelling caused the mass to break on board until she seemed literally to be buried in a smother of gray-white water, while sheets of spray swept high over her mastheads and funnels. For quite an appreciable time she was hidden, but then slid back into sight on the crest of a sea, with her twin propellers revolving wildly in the air, to disappear in the darkness as suddenly as she had come, with her consort still in close station behind her.

'Thank the Lord I'm not in a T.B.D.!' muttered the officer of the watch to the navigator.

Martin shared his feelings.

For the next forty minutes the guns' crews in the battleships were very busy; for, having sighted the searchlights during the first attack,

the remainder of the flotilla, attracted to the spot like wasps to a honey-pot, came dashing in from all directions to deliver their assaults. They came on gallantly, some singly, others in pairs or fours at a time; and though, naturally enough, the battleships claimed to have sunk every mother's son of them long before they had had a chance of getting home with their torpedoes, the destroyers themselves thought otherwise.

The attacks were over by two A.M., and at this time the weary men at the guns and search-lights were free to go to their hammocks, the scattered destroyers were collected by their senior officer, and attackers and attacked, with navigation lights burning, turned their bows homeward.

By eight o'clock the battleships had moored in Portland Harbour, and the destroyers, in a long single line, headed by their light cruiser, came silently in through the northern entrance on their way to the pens. Their funnels were caked white with dried salt, but they steamed past jauntily, showing few traces of their buffeting.

Martin watched them with a new interest, for to him it seemed nothing short of miraculous how such slender-looking vessels could stand the weather he had seen them in a few hours before.

'What yer lookin' at, Pincher?' asked Billings, stopping on his way to his mess for breakfast.

'Them,' said Martin, jerking his head in the direction of the destroyers.

'Them!' said Joshua, rather surprised. 'What's up wi' 'em?'

'I wus thinkin' it must be a dawg's life to be aboard one o' 'em. They looked somethink horful larst night.'

Billings, who had served in a destroyer himself in his young and palmy days, grinned broadly. 'They ain't so bad,' he murmured. 'You gets a tanner a day,* 'ard lyers in 'em, an' that's a hextry three an' a tanner a week. It's werry welcome in these 'ere 'ard times.' The old reprobate smacked his lips longingly, for three-and-six a week meant many pints of beer.

'I reckons they deserves it,' Martin remarked.

'I reckons all matloes deserves double wot they gits,' laughed his companion. 'But larst night weren't nothin'. You wait till yer sees 'em in a gale o' wind; then they carries on somethin' hawful. Larst night it weren't blowin' nothin' to speak o'. They 'ad a bit o' a dustin' p'raps, an' got their shirts wet, but that ain't nothin'!'

Martin gasped. He had seen the destroyers plunging about like maddened racehorses, with water breaking over their decks; but yet Billings referred to it casually as a 'bit o' a dustin'. If their behaviour of last night was nothing out of the ordinary, he prayed his gods he might never serve in one of them. 'A bit o' a dustin', indeed! What must they be like in a gale of wind? It nearly made him seasick to think of it.

(Continued on page 370.)

THE RESCUE OF A BRITISH RED CROSS HOSPITAL PARTY.

ON a night in mid-September 1914, a British torpedo-boat-destroyer was making her way from Dover to Ostend. Pacing the deck was a young staff-officer, Captain Henry Gilroy by name. Happening to be in Liège when war was declared, he had escaped from Belgium in the very nick of time, and was now returning to that sorely stricken land on a mission for which he had been specially selected by the War Office on account of his complete mastery of the language and his unrivalled knowledge of local conditions.

In those early weeks of the war all Britain was agog with the belief that Antwerp would prove a rankling thorn in the ribs of the Germans, while men in high places cherished the delusion that a flank attack was possible along the Ostend-Bruges-Brussels line.

But Gilroy was an eminently sane person. He understood the situation only too well to be thus deceived. When the lieutenant-commander in charge of the destroyer took him below half-way across for a smoke and a drink,

and the talk turned on strategy, the soldier dispelled an alluring mirage with a breath of common-sense. 'The scheme is nothing short of rank lunacy,' he said. 'We haven't the men; France can spare none of hers, and Belgium must be crushed when the big battalions come. Germany has at least three millions in the field already. Paris has been saved by a miracle. By some other miracle we may check the onrush in France; but if we start dividing our forces, even Heaven won't help us.'

'Surely you'll admit that we should strengthen the defence of Antwerp?' argued the sailor.

'I think it impracticable. Liège only held out until the new siege howitzers arrived. Namur fell at once. Why should we expect Antwerp to be impregnable?'

The navy deemed the army pessimistic; but exactly a month later the lieutenant-commander remembered that conversation, and remarked to a friend that about the middle of September he

* Men serving in destroyers receive sixpence a day extra pay. It is known as 'hard-lying money.'

took to Ostend 'a chap on the staff who seemed to know a bit.'

It is now a matter of historical fact that when Von Kluck and Sir John French began their famous race to the north, the Belgian army only escaped from Antwerp by the skin of its teeth. The city itself was occupied by the Germans on 9th October, Bruges was entered on the 13th, Von Bessler's army reached the coast on the 15th, and the British and Belgians were attacked on the line of the Yser next day.

Thus fate decreed that Gilroy should witness the beginning and the end of Germany's shameless outrage on a peaceful and peace-loving country. On 2nd August 1914 King Albert ruled over the most prosperous and contented small kingdom in Europe. Within eleven weeks he had become, as Emile Cammaerts finely puts it, 'lord of a hundred fields and a few spires.'

Though Gilroy should live far beyond the allotted span of man's life, he will never forget the strain, the misery, the sheer hopelessness of the second month he spent in Belgium. The climax came when he found himself literally overwhelmed by the host of refugees, wounded men, and scattered military units which sought succour in, and—as the iron ring of *Kultur* drew close—transport from, Ostend.

With the retreat of the Belgian army toward Dunkirk, and the return to England of such portion of the ill-fated Naval Division as was not interned in Holland, his military duties ceased. In his own and the country's interests he ought to have made certain of a berth on the last passenger-steamer to leave Ostend for England. He, at least, could have done so, though there were sixty thousand frenzied people crowding the quays, and hundreds, if not thousands, of comparatively wealthy men offering fabulous sums for the use of any type of vessel which would take them and their families to safety. But at the eleventh hour Gilroy heard that a British Red Cross Hospital party, which had extricated itself from the clutch of the mailed fist, was even then *en route* from Bruges to Ostend by way of Zeebrugge. Knowing they would be in dire need of help, he resolved to stay, though his action was quixotic, since no mercy would be shown him if he fell into the hands of the Germans. He took one precaution, therefore. Some service rendered to a tradesman had enabled him to buy a reliable and speedy motor-bicycle, on which, as a last resource, he might scurry to Dunkirk. His field service baggage was reposing in a small hotel near the harbour. For all he can tell, it is reposing there yet; he never saw it again after he leaped into the saddle of the Ariel, and sped through the cobbled streets which led to the north road along the coast. The hour was then about six o'clock on the evening of 13th October.

A Belgian staff-officer had assured him that the Germans could not possibly occupy Ostend

until late next day. The Belgian army, though hopelessly outnumbered, had never been either disorganised or outmanoeuvred. The retreat to the Yser, if swift, was orderly, and the rear-guard could be trusted to follow its timetable.

Hence Gilroy determined to cover the thirteen miles to Blankenberghe before it was dark. The hospital, which was conveying British and Belgian wounded, would travel thence by the quaint steam-tramway which links up the towns on the littoral. It might experience almost insuperable difficulties on the way, and he was one of the few aware of the actual time-limit at disposal, while a field hospital bereft of transport is a peculiarly impotent organisation.

Road and rail ran almost parallel among the sand-dunes. At various crossings he could ascertain whether or not any tram had passed recently in the direction of Ostend, thus making assurance doubly sure, though the stationmaster at the town terminus was positive that the next tram would not arrive until half-past seven. Gilroy meant intercepting that tram at Blankenberghe.

Naturally, it was late in reaching the latter place, but the only practicable course was to wait there, rather than risk missing it. A crowd of terrified people gathered around the calm-eyed, quiet-mannered Briton, and appealed for advice. Poor creatures, they imposed a cruel dilemma! On the one hand, it was monstrous to send a whole community flying for their lives along the Ostend road; on the other, he had witnessed the fate of Visé and Huy. Yet by remaining in their homes they had some prospect of life and ultimate liberty, while their lot would be far worse the instant they were plunged into the panic and miseries of Ostend. So he comforted the unhappy folk as best he might, though his heart was wrung with pity at sight of the common faith in the Red Cross brassard. Men, women, and children wore the badge indiscriminately. They regarded it as a shield against the Uhlan's lance! Most fortunately for that strip of Belgium, the policy of 'frightfulness' was moderated once the country was overrun. So far as local occurrences have been permitted to become known, the coast towns have been spared the fate of those in the interior.

To Gilroy's great relief, the incoming tram from Zeebrugge brought the British hospital. There were four doctors, eight nurses, and fifty-three wounded men, including a sergeant and ten privates of the Gordon Highlanders, who had scrambled across Belgium after Mons.

The tram offered an extraordinary spectacle. Soldiers and civilians were packed in it and on it. Men and women sat precariously on the roofs of the ramshackle carriages, stood on the buffers and couplings, or clung to door-handles. Not even foothold was to be had for love or money on that tram at Blankenberghe.

Gilroy, who dared not let go his machine, con-

trived to get a word with the medical officer in charge.

As ever, the Briton made light of past troubles. 'We've had the time of our lives!' was the cheery comment. 'After Mons we were left in a field hospital with a mixed crowd of British, French, and Germans. Of course, we looked after all alike, and that saved our bacon, because even a German General had to try to behave decently when he found a thousand of his own men in our care. So he sent us to Brussels with a safe conduct, and from Brussels we were allowed to make for Ostend—had to leg it, though, the last twenty miles to the Belgian outposts. Then we refitted, and started for Bruges, where we've been at work in a convent for five weeks. The remnant of the Belgian army passed through Bruges yesterday and the day before, so we cleared out all possible cases, and started away with the creaks early this morning. At the last minute we were hustled a bit by a Taube dropping bombs on the station. One bomb took from us a vanload of kit. We haven't a thing except the stretchers and what we're wearing.'

'I'll ride on now, and meet you at Ostend,' said Gilroy. He had not the heart to damp the spirits of the party by telling of the chaos awaiting them. Sufficient for the next hour would be the evil thereof.

'I say it's awfully good of you to take all this trouble,' said the doctor.

'I've lost my job with the departure of our troops, so I had to find something to do,' smiled the other.

A fleet of Belgian armoured cars cleared a road through the stream of fugitives, and Gilroy kept close in rear, so he made a fast return journey. Dashing past the town station, near which the steam-tram would disgorge its freight, he headed straight for the Gare Maritime. It was now dusk, but he saw at once that the crowd besieging the entrance was denser and more frantic than ever, though the last steamer whose departure was announced officially had left early in the day.

He ascertained from a helpless policeman that the rumour had gone round of a vessel coming in; the sullen, apathetic multitude, waiting there for it knew not what chance of rescue, had suddenly become dangerous.

'The American consul, who has worked hard all day, has had to give it up,' added the man. 'He is closing his office.'

Just then a harbour official, minus his cap, and with coat badly torn during a violent passage through the mob, strode by, breathless but hurried.

Gilroy recognised him, having had much business with the port authorities during the preceding week. 'Is it true that a steamer is in sight?' he asked.

'Monsieur, what am I to say?' and the accompanying gesture was eloquent. 'It is only a

little cargo-boat, an English coaster. If she nears the quay there will be a riot, and perhaps thousands of lives lost. The harbour-master has sent me to ask the mayor if he should not signal her to anchor outside until daylight.'

Prompt decision and steadfast action were Gilroy's chief qualities. If luck favoured him he might set his own project on foot before the mayor's messenger burked it by a civic order. He thanked the man and rode off.

Happily the tram came from Blankenberghe without undue delay. He had only dismounted when the engine clanked into the station square. Already his soldier's eye had noted that the Gordons and some of the Belgian soldiers had retained their rifles and bayonets.

'Get your crowd into motion at once,' he said to the doctor, as soon as the latter alighted. 'Nothing you have gone through during the last two months will equal the excitement of the next quarter of an hour. But if your cripples can fix bayonets and show a bold front, we have a fighting chance—no more. And unless we leave Ostend before to-morrow morning, it'll be a German prison for both you and me.'

Men who have smelt war and death, not once but many times, do not hesitate and argue when a staff-officer talks in that strain.

With an almost marvellous rapidity the members of the mission and the wounded able to walk were formed up, stretchers were lifted, and the march began. Gilroy and the doctor headed the procession with the Gordons, and the mere appearance of a Highlander enforces awe in any part of Europe.

Gilroy explained matters as he went, and impressed on the escort the absolute necessity of showing a determined front. On nearing the packed mass of people clamouring outside the Gare Maritime he vociferated some sharp orders, the rifles came from the slope to the ready, and those on the outskirts of the throng saw a number of war-stained kilties advancing on them with threatening mien.

By some magic a way was opened out. The vanguard knew exactly how to act, and faced about when the main gates were reached. Here there was a hitch; but a threat to fire a volley through the bars was effectual, and the whole party got through, though even the hardened doctors looked grave when they heard the wail of anguish that went up from the multitude without as the gates clashed against further ingress.

Of course, as might be expected, there were hundreds of influential people, both British subjects and Belgians, already inside. To them Gilroy gave no immediate heed. Merely requesting the doctor to keep his contingent together and distinct, he sought the harbour-master.

No orders had been received as yet from the

mayor, and the incoming steamer, quite a small craft, was already in the channel.

The harbour-master, a decent fellow, whose sole anxiety was to act for the best, readily agreed to Gilroy's plan; so the vessel, whose skipper had actually brought her to Ostend that evening 'on spec,' as he put it, was moored at a distance of some ten feet from the quay.

'How many people can you carry?' was Gilroy's first question to the captain.

'Well, sir,' came the surprising answer, 'we're licensed by the Board of Trade to carry forty-five passengers in summer; but in a pinch like this I'll try to stow away two hundred.'

After that there was no hitch. A gangway was fixed in position, the armed guard were disposed around it, and the doctors and Gilroy, with a representative of the burgomaster who arrived later, constituted themselves a committee of selection. The hospital staff and their patients were placed on board first. Wounded soldiers picked up in Ostend itself were given the next claim. Then British subjects, and finally Belgian refugees, were admitted.

It was a long and tedious, yet almost heart-breaking, business; but the order of priority established a method whereby claims might be tested with some show of equity. At last, at some hour, none knew or cared exactly when, the steamer forged slowly out into the channel, backed, and swung, amid the shrieks and lamentations of the thousands who were left to the tender mercies of *Kultur*.

In addition to her crew, she carried seven hundred and thirty-nine passengers, mostly wounded soldiers, women, and children!

There was no room to lie down, save in the space rigidly preserved for the stretcher cases. The decks, the cabins, the holds were packed tight with a living freight. Surely never before has vessel put to sea so loaded with human beings.

The captain decided not to attempt the crossing by night, and lay to till morning. The ship's boats returned to the quay, and brought off some food and water.

Meanwhile leaders of sections were chosen, the people were instructed as to the danger of lurching, and ropes were arranged so that any unexpected movement of the hull might be counteracted.

At eight o'clock next morning the engines were started; at ten o'clock that night the ship was berthed at Dover. By the mercy of Providence the sea remained smooth all day, though the heavy tidal swell caused dangerous and anxious moments. Of course, there were mine-fields to be avoided, and strong tides to be cheated; allowing for these hindrances, the trip occupied fourteen hours, whereas the Belgian mail packets employed on the same journey used to adhere steadily to a schedule of three hours and three-quarters!

On the way death took his dread toll among the wounded, but to nothing like the extent that might well have been feared. The bringing of that great company of people from the horrors of the German occupation of Belgium to the safe harbourage of the United Kingdom was a magnificent achievement, worthy of high place in the crowded and glorious annals of British seamanship.

A POWERFUL ROGUE.

BEING THE TRUE STORY OF HOW SHER SING CONQUERED THE ELEPHANT WHO TRIED TO DROWN HIS MAHOUT.

By Mrs CATHERINE F. DEIGHTON, Author of *Domestic Economy, Practical Housewifery, &c.*

IT was evening, just a short while before sunset; and as I left the tent where the master was still busy hearing petitions and trying to put wrong right, the cattle, goats, and sheep were slowly wending their way across the maidan toward the village some half-mile distant, and the sun sinking in the west cast long shadows of trees, men, and animals.

Accompanied by my *peon*, Hussein Raman, I strolled toward the village, where through the trees one could see the white dome of the mosque and the minarets of the temple glinting in the sunlight. As I left the *tope* where the tents were pitched, I saw that the herd-boys were driving the buffaloes and the cows to a large tank to give them their evening drink before taking them to their homes in the village; so I told Hussein Raman to lead the way to the tank *bund* before going to the village.

Arrived at the top of the *bund*, I stood watching the scene before me. To my right the boys were driving the buffaloes and the cows into the water, where great splashings showed how the buffaloes at any rate enjoyed the coolness after the heat of the day, and the laughter and talking of the herd-boys showed that they too were enjoying themselves, their day's work of looking after the cattle being done. From the village came the women with their water-pots to draw the evening supply, many of them either carrying babies or accompanied by tiny toddlers clinging to them.

Of men there were but few; but I noticed, sitting beneath a large banyan-tree, a fine-looking old man with snow-white hair. He appeared to be of advanced age, and young and old showed him great reverence and respect, even more so than is usually shown to the old out here, where age

meets with the deference and respect that should ever be meted out to it. He spoke little to the two men who were with him, but sat leaning forward watching the boys playing in the water, and the people coming from and going to the village, his gnarled and knotted hands clasping a stout stick.

'See, Hussein Raman,' I called, 'who is that grand old man sitting there beneath the banyan-tree, to whom all who pass by offer reverence?'

'Mem Sahib,' he replied, 'that is Sher Sing, a great and mighty warrior in the past, who has spoken with Rabat Sahib Bahadur [Lord Roberts], who has even now but lately died. Sher Sing can also speak great tales of the wars of long ago, when Jan Nikalseyn [John Nicholson] Sahib was alive; and he has seen the Nana Sahib, who betrayed and slew the men, women, and children in the days of the great mutiny against the British Raj. Ah yes, Sher Sing is a great and mighty warrior; and he it was who conquered the elephant who, until Sher Sing rode him, always drowned his mahout when there was a river to cross; and he it was who carried the famous necklace safely back to the regiment from Calcutta, where the Colonel Sahib took it to have its value set upon it, and where the Colonel Sahib fell sick and had to cross the *kali pani* [black water], whence he never returned. Ah me!' he half sighed, 'truly Sher Sing is a great man, and has seen and done many mighty deeds.'

'Go to Sher Sing,' I commanded Hussein. 'Give my salaams, and ask him if he will come round to the tents to-morrow, to talk with the Collector Sahib and me, to tell us of the wondrous things he has seen, heard, and done.'

'I go, Mem Sahib,' replied Hussein, salaaming, and moved off along the *bund* to where the stately old warrior was sitting. I saw him approach Sher Sing and salaam profusely; and then, after a few minutes' conversation, he returned to me with the message that Sher Sing would come to the tents the following day.

As I had spent so much time on the tank *bund*, it was too late for me to go on to the village; so I went back to the camp to tell the master about Sher Sing, and also to inform him that he would come to the tents on the next day and tell us some of the stirring stories of battles and deeds in which he had taken part.

The following is the story told us by Sher Sing of the wicked elephant who always tried to drown his mahout when crossing a river.

Many years ago, long before the days of railroads crossing and recrossing the country, when regiments moved from one station to another they had to march, and these marches sometimes took from eight to ten weeks. To move a whole regiment meant a great deal of baggage, and for that reason elephants were used for carrying the guns and the heavier *samaan*, such as the tents,

the food-boxes, and the sacks of grain. The officers had, of course, to arrange for the conveyance of their own *samaan* either by *bandies* or by elephant.

In fine and dry weather such marches were pleasant enough. The regiment would start off in the cool of the morning, and would reach the new camping-ground before the great heat of the day, unless it was in war-time, and then, of course, the men had to push on regardless of the heat, often not waiting for the tents to come up, lest they should be too late to render the aid desired of them. The most trying time of all to march was when the rains were on; and, indeed, unless it was war-time and help was urgently needed, no General worthy of the name would ever dream of moving his troops then; but at the time when Sher Sing conquered the wicked elephant the regiment was on its way to relieve a war-pressed garrison.

The monsoon had burst early, and this had hampered and delayed the regiment; and when they arrived at the banks of the sacred river, the Ganges, lo! it was in flood. No one could cross, for even the tallest elephant would not have the strength to withstand the stream that swept by in a roaring torrent, tearing up trees and sweeping away whole villages from the low-lying lands around its banks. The only thing to do was to wait until the torrent rushed by a little less fiercely; so the men were ordered to find timber and to make stout rafts for carrying the regiment and horses from shore to shore.

Two days passed without rain, and still the mighty river rushed by, defying the men on its banks to cross it. Bamboos were thrust in at the water's edge to gauge the rise or fall of the water. On the fifth day the waters began to subside, as one bamboo was high and dry, and round another the water only lapped at the bottom; so new bamboos were thrust in as far out in the water as a man dared wade.

The sixth day passed, and still the river was deemed too dangerous for even the elephants to attempt to cross it; but on the evening of the seventh day the colonel gave orders that the elephants would start fording the river at day-break the following morning, the biggest and strongest elephant being detailed to lead the way. Shortly after the order was given out cries and wails were heard coming from the elephant lines. Thinking that something unforeseen had occurred, and that some of the men had died, or that an elephant had died, which would have been almost as great a loss as that of some of the men, the colonel sent the adjutant of the regiment down to the lines to find out what was the matter.

The adjutant, accompanied by three or four officers, left the mess-tent, and walked through the gathering twilight toward the twinkling lights that showed where the elephant lines were, each huge beast being chained to heavy

weights to prevent his straying in the jungle. Fires were lighted at intervals all round the camp to scare away the wild beasts, and to keep them from attacking the horses and draught bulls and buffaloes. The four officers passed by groups of men who were talking earnestly together; others were cooking their food for the evening meal, the flickering flames casting weird shadows. Then came the horses, and after them the draught bulls and buffaloes, then cows, goats, and sheep; for, remember, in those days a regiment had to march its live-stock with it, as no country village then or now, however willing, could give daily supplies to a whole regiment without starving its own people. After the cattle came the elephants, and great was the weeping and wailing to be heard.

As the adjutant and his brother-officers approached, the jemadar of mahouts came up and saluted.

'What is all this noise about, jemadar?' demanded the adjutant in his sternest tones.

'Adjutant Sahib,' replied the jemadar, 'the Colonel Sahib has given orders, as thou knowest well, that the elephants are to begin to cross the river at daybreak to-morrow; hence this weeping.'

'But why should the elephants having to cross the river cause all this commotion? Stop it. It must not be.' And the adjutant turned on his heel and started to return to the mess-tent.

'Sahib, sahib!' cried the jemadar, 'hear, I beseech you, the reason why the Colonel Sahib's order for the elephants to cross the river has caused this sorrow and wailing. It is because of the biggest of the elephants; no one will ride him, for he is a great and wicked beast.'

'What folly is this, jemadar? The mahout has been drinking,' said the adjutant testily.

'Nay, sahib,' replied the jemadar. 'Idar Sing is a brave and a good man, but he will not take the elephant across the river to-morrow morning.'

'Jemadar, this is rank mutiny,' cried one of the other officers.

'Nay, sahib,' said the jemadar respectfully; 'it is not mutiny, Huzoor. You will remember Bir Sing, who met his death when bringing up supplies to the regiment. Again, Wazir Sing was picked up dead, the elephant coming into the camp by himself; and yet once more, not two weeks ago Sant Sing was picked up crushed and beaten, and died without speaking. What caused their deaths, oh sahibs? Ye know that they were brave men and true. What, then, caused their deaths? Tell me that.'

'That I am afraid I cannot tell,' replied the adjutant; 'but you seem to know, jemadar, so out with it, and let us know what you believe.'

'Sahib,' said the jemadar, 'it was the big elephant; of that I am quite sure, for he is not really an elephant, but an evil spirit come to

earth for a given time, and that is why no man can manage him; and he who tries to control the creature and bend him to his will is at once either killed or injured by him.'

The adjutant looked grave; then, turning to his companions, he said, 'Let us go and see the brute. Maybe there is some sore on him which, when he enters the water, smart, and that makes him wild and unmanageable.—Come, jemadar, and point out to me this evil beast.'

The jemadar led the way a few steps farther on to where the elephants stood in a row, great unwieldy beasts, ever restless, moving now on this foot, now on the other, clanking their chains, and ever and again throwing up their trunks and snorting through them. At the head of the line, some little distance from the others, stood a gigantic beast, and this was the one described by the jemadar as being possessed with an evil spirit; and truly, as the men drew near to him, his little eyes seemed to wink wickedly at them. He was throwing about some leaves and stamping. He was a magnificent brute, and appeared to glory in his mighty strength. Big as the other elephants were, they seemed to be dwarfed by this huge creature.

'He does look a wicked brute,' said the adjutant. 'Why use him? If Idar Sing will not or is afraid to ride him across the river when it is in flood, let him wait and cross when the water subsides. Let the other elephants take the *samaan*.'

'Huzoor,' said the jemadar, 'that cannot be, for this elephant is the leader, and unless he goes first not one of the others will move away from the bank; besides which, he is the biggest and the strongest, and carries the heaviest load. No; he will have to lead the way, and when he enters the water and begins to cross there will be no trouble with the others; but before he reaches the opposite bank the man who rides him will be a corpse, his wife a widow, and his children orphans.'

'I cannot help it, jemadar,' said the adjutant. 'The Colonel Sahib has given orders that the elephants are to cross the river at daybreak to-morrow, and these orders must be obeyed.'

'Huzoor, thou wilt be obeyed,' said the jemadar.

The adjutant and the other officers turned to leave the elephant lines, when a fine young sepoy stepped forward and saluted.

'Well, who are you, and what do you want?' asked the adjutant.

'Sahib,' he replied, 'I am Sher Sing.'

'Well, then, Sher Sing, what do you want? Out with it. Don't stand there like the *hutti* yonder, always moving first one leg and then the other. If you want to ask me anything, ask it.'

'Huzoor,' Sher Sing began, and then paused.

'Well,' said the adjutant, 'what is it you want? I have told you to speak.'

'Sahib,' said Sher Sing, 'I will take the big elephant across the river to-morrow morning, or will die in the attempt.'

A groan burst from the jemadar. Sher Sing was one of the finest men in the regiment.

'You will take the big elephant across the river? Why, Sher Sing, you are not a mahout; and if a mahout cannot manage the vicious brute, do you think that you will be able to?'

'If the Presence will let me, I will take the big elephant across the river,' said Sher Sing doggedly.

'Sahib,' cried the jemadar, 'let not Sher Sing do this mad deed. I love him as my son, and I shall see him killed before my eyes.'

'Now, look here, jemadar,' said the adjutant. 'You tell me that Idar Sing refuses to ride the elephant. The Colonel Sahib gives his order that the elephants cross the river to-morrow morning. Sher Sing comes and says that he will take the wicked one across. Sher Sing will do it. *Bus*.'

'God's will be done!' murmured the jemadar as he turned sadly away.

That night in the elephant lines prayers were said and offerings made to the gods so that Sher Sing might not be killed on the morrow. The wicked elephant had much food given to him, prayers were said to him, and offerings of sweetmeats brought that he might not harm the brave Sher Sing; but he whisked his little tail and flourished his trunk as if to say, 'What fools these people be!'

The morning dawned gray and cloudy, and the rushing torrent appeared not to have abated one jot as it raced by, still bearing rooted-up trees and other debris in its course.

The whole regiment, officers and men, were up betimes to see the elephants cross the mighty stream; and the deepest interest was centred on Sher Sing, whose offer to ride the wicked elephant across the river was soon known throughout the regiment.

The *samaan* was brought out and fastened securely to each elephant, extra strong ropes and leather thongs being used for fear that it would be washed off the animals' backs by the rush of water.

The colonel and his officers came to see the start. Everything seemed to be ready, yet no mahout had mounted his elephant; all appeared to be engaged in some religious ceremony. The colonel called to a havildar of the regiment standing near by, 'What are they waiting for? The elephants are loaded with *samaan*; why do they not start?'

'Sahib,' replied the havildar, 'the prayers for the dead are being said for Sher Sing, whom none of us will see alive again. Sahib, from the moment that he mounts the big elephant he is a dead man.'

The colonel made no reply, but turned away

and stood in silence, watching the rushing torrent of the river.

Suddenly there was a stir amongst the men, and Sher Sing, accompanied by the jemadar, walked toward the big elephant. He was naked except for his loin-cloth, and every muscle of his strong body showed out. His handsome face was grave as he looked at all the ropes and fastenings that held the *samaan* in its place on the elephant's back. In his right hand he grasped a short, strong, bamboo spear with a fine steel head; to the bamboo was attached a leather thong, and this was wound round his wrist and securely fastened. He also wore a strong leather belt, with stout leather straps; and as he stepped forward and saluted first the colonel and then the other officers, the colonel asked him why he was wearing the belt.

'Sahib,' said Sher Sing, 'these straps,' taking one up in his hand, 'will fasten me to the strap that goes round the neck of the elephant, and thus, should I be swept off him by the rush of water, I shall be able to regain my place by the aid of the strap.' He once more saluted and turned away.

'There goes a fine man, and a brave man,' said the colonel. 'I would that there were more with his courage and forethought. Nothing left to chance. I hope to God that he will win through!'

A shout went up from the onlookers when Sher Sing mounted the elephant, and had himself strapped securely to the band passing round the animal's neck. A slight prod with the spear made the huge beast rise from his knees. Then he stood quite still, and, turning his trunk first to one side and then to the other, seemed to sniff his rider. Sher Sing spoke to the elephant, and silence fell on the watchers as they parted into two lines, down the centre of which the great beast slowly took his way, followed by the other baggage elephants. Arrived at the water's edge, he stopped, sniffed at some juicy tufts of grass on the bank, tore them up with his trunk, and proceeded to eat them; then, trumpeting loudly, he faced the water. He put one foot out cautiously into the stream, feeling to see if he had a firm foothold; finding it firm, he walked a yard or two into the water. There he stood still, and then began playfully to squirt water over himself and his rider. Getting tired of this game, he moved farther into the stream, the water now reaching almost to his middle. Again he stopped. Sher Sing sat like a rock. Every one on the bank seemed to hold his breath, as all knew that the struggle was about to begin.

The elephant drank some water. Then he lifted his trunk and tried to put it round Sher Sing; and, catching his leg, with a jerk the elephant tried to pull him off, but the straps held securely. At the same moment Sher Sing raised his spear in the air and brought it down

with a thud on the elephant's head. It was a mighty blow ; and, giving a cry, or, rather, a roar of rage and pain, the animal plunged forward into deepest water. Again he stood still, but only for a moment. Aghast, the watchers on the bank saw that the huge beast was gradually lowering himself in the water, until his body was covered. Down, down, he sank. Could he have got into a quicksand? No, that could not be so, for Sher Sing was seen to raise his arm and hit the elephant again and again. At last only the elephant's trunk held up and the tireless right arm of Sher Sing were all that could be seen of either man or beast. The minutes seemed like hours, and the only sound to be heard was that of the river rushing by.

A gasp of relief came from the watchers. The elephant had risen once more, and was again trying to unseat his rider with his powerful trunk. Now Sher Sing must have plied his spear with all his might, for the great brute, giving himself a shake, dashed into deep water. The current was so strong that, powerful as he was, he could not make headway against it. Once more he sank, and again Sher Sing's relentless arm hammered blows on the elephant's head.

To the onlookers, who by this time were some distance off, it appeared that Sher Sing was getting exhausted ; but they could still see his arm rising and falling, and this at any rate showed that he was not only alive, but that he was conscious, and still had the strength to continue the fight.

Again the elephant sank, and to the watchers it seemed that he must have won the contest, as no one could distinguish Sher Sing's right arm rising and falling raining blows ; but the distance was great. Every one strained his eyes to the utmost.

Suddenly a great cry arose. The elephant had come to the surface of the water, and still clinging to him was Sher Sing. No longer was his arm relentlessly rising and falling dealing out a succession of blows, but he seemed to be waving his spear as if in triumph. And this was indeed the case, for the elephant was wading quite quietly toward the opposite shore, which was reached without further difficulty. But such was the force of the current that the elephant landed on the opposite bank a mile farther down the stream than the spot where he had entered the river.

The other elephants got across without any accidents happening, some of them landing one and a half miles, others two miles or more, farther down the stream, not having had the strength to withstand the rush of the current. One of the rafts taking the men and horses across the river was carried down by the current for over three miles before a landing was effected.

The next day every one in the regiment, from the colonel downward, came to look at the big elephant, who stood quietly eating his food, taking no notice of any one. His head was covered with cuts and gashes where Sher Sing had hit him with the spear ; but they did not seem to trouble him at all, and they very quickly healed up. From that day he became quite tractable, and acknowledged man as his master. Being such a powerful beast, he was much prized on account of his great strength, which enabled him to carry very heavy loads.

Sher Sing, too, quickly recovered from his exertions. He was a faithful soldier and servant of Queen Victoria, to whose Jubilee he came with a detachment of his regiment. He again visited England at the time of King Edward's coronation ; for, although he was then an old man, and had gained his pension, he was held in high esteem, and was sent because he had such a good influence over the younger men.

THE HILL-NEST OF THE CLANS.

THE sun glints o'er the rippling rills,
And on the bonny braes ;
It lingers on a hundred hills,
A hundred waterways ;

From Lowland plains and daisied leas
Its girdling glory spans,
The purpling moors, the limpid seas,
The hill-nest of the clans.

And loud and long the curlew shrills
Her piercing, plaintive cry
Across the dumbness of the hills,
The silence of the sky.

The burnie's gushing, richly brown,
Through brake and bog and fen ;
By bosky banks it wimples down
The dusky fairy glen.

Beyond a thousand leagues of sea,
Behind the desert space,
Far off—far off—there sounds to me
The Call of Home and Race,

That o'er the wide sea's ebb and flow
Soft to my bosom brings
Sweet memories of long ago,
Dreams of forgotten things.

O'er swelling sands that round me roll
My stirrèd spirit scans
The Homestead of my exiled soul—
The hill-nest of the clans.

And, far from stress and strife of men,
I seem to smile once more ;
My heart within the dusky glen,
My foot on Scotland's shore.

SEVENTH SERIES

THE MANSION OF ADAM.

By the LADY FRANCES BALFOUR.

IT stands on the banks of one of the great waterways of commerce. The river runs into the firth, and the shores are set round with shipyards and ports. When the foundations of the mansion were dug, green and pleasant pastures sloped to the river-bank; a walled garden ran round it, set with orchard trees, herbs, and flowers, as yet unsullied by the grime of factory and forge. A comfortable family house, designed and decorated throughout by the master architect of the North. No speculative builder had a hand in it. The moulder and plasterer wrought through the leisured days modelling the graceful classical designs which adorn it from domed skylight to the fanlights of the doorways. Within the solid walls turns the winding staircase, the banistered rail swelling out at the stair, a reminder of the hooped ladies who passed in and out; the mahogany polished doors telling of the epoch when foreign woods came in abundance in the holds of the trading-vessels.

In that period it was the 'big hoose' of the little fishing-village near at hand, and across the river-bank the small, yet steadily spreading, commercial town. So was reared the mansion-house away back in the quiet days of the eighteenth century, the time when Scotland began that growth in commercial enterprise in which she and her cities were to grow and flourish greatly in worldly prosperity.

In the mansion-house lived the shrewd, canny merchant—a bailie, no doubt with dreams of the provostship; an elder of the Kirk, which put no bar in the road of his ventures; they might be in a slave-trader, or his gains might be reaped from a Southern plantation. The womenfolk guided the gear, saw to the household plishings, were 'weel respectit,' and reared the citizens that were to own the ships on the river and guide the trading markets.

Softly dreaming, the river passed by its banks, swollen by the mists and storms in the long, dark winters, and dwindling small and evil-smelling in the summer droughts. Thus the old order, moving sedately through its accustomed unquestioning ways, has passed along the current of the centuries.

The mansion is still standing; but those who built it and lived within its shelter would find it hard to recognise. The garden has disappeared,

and where it stood there run grimy roads set with tram-lines. The pastures are beaten spaces of earth, where vast sheds covering the engine and the anvil stand in ordered confusion. The house remains, the outer steps worn, the delicate balustrading broken down; the pleasant rooms, stripped of furniture, are used by the designers for the shipyard. On every hand tower the stocks on which are cradled the ships of the future. The hammers ring unceasingly, and the clanking engines are never at rest. The river-banks are dark and stained, the low clouds are charged with the darkness of smoke unending, and the never-ceasing rain falls in driven storms across the mile-long stretches of yards.

Through the gates come trooping the workers, the men who can give or withhold so much in these days of toil with head and heart and hand. The mansion-house is again being worked by women, who are attending to the household gear in the shape of canteen food for the riverside builders and makers. Once again the kitchen is odorous with baked meats and steaming broth. The withdrawing-room, parlour, and dining-room are set with tables, and there is little excuse to wander outside for the glass that inebriates and does not speed the work.

The mansion stands in its monumental dignity, teeming with a new generation, and under its roof strange things are thought and said. Men pass it by careless of that for which it stands, and others enter and use its comforts, and pass away unheeding. The ancient roof-tree knows that as its walls have seen better times, so it has seen a better race of citizens in the days that are behind—men who feared God, and believed in their country and their city; men of thrift, of hardihood, of pride and honesty, upright in walk and conversation. Their successors in the industrial life of Scotland have in many instances ceased to walk in the footprints of those who made Scotland an example among the nations. The canker that eats the life out of the people and has darkened counsel is the love of strong drink, and the slothful self-seeking habits which are engendered by intemperance. It is impossible to serve God, to love the neighbour or the country, and to be a slave to drink. That form of mammon and the Christian ideal of service cannot go together.

The men who see this most clearly are those who have left for a time the ranks of industry, and are serving in the armies of the nation. They have learnt under discipline that service and drunkenness are not compatible. They, in the hour of the fight, know how much they have to rely on those who should be toiling for them in arsenal and shipyard. The toll of life

taken from them is the measure of the work of the comrade or the slacker in the workshops they have left. They who fail them will have a stern sentence pronounced by the men who have fought and passed through the fiery ordeal to win the victory for the dwellers in the ancient mansions and homes of Scotland.

PINCHER MARTIN, O.D.

CHAPTER IV.—*continued.*

II.

AS a start to his seagoing training, Martin found himself put in the gunnery-training class with eleven other youngsters like himself; and here, under the expert guidance of Petty Officer Samuel Breech, he was soon being initiated into the mysteries of squad drill, the rifle and field exercise, the various parts of a rifle and their uses, gun drill, the anatomy and interior economy of lighter weapons and machine-guns, and their ammunition. Much of it he had already learnt before, during his period of preliminary training at the barracks, and the instruction, essentially practical, did not overtax his intelligence.

Petty Officer Breech, a fully qualified gunner's mate, was a strict disciplinarian and something of a martinet. He was a short, burly little man, with a bull-neck and a rasping voice; and the former, combined with a closely clipped red beard and a pair of piercing gray eyes, gave him an air of ferocity which he really did not possess. He was naturally kind-hearted, and the buxom Mrs Breech could twiddle him round her little finger. But on board ship he upheld his dignity with firmness. After long experience with ordinary seamen and their ways, he had come to the conclusion that the only way of getting them thoroughly in hand was to frighten them at the start, and to keep them frightened; so he invariably commenced operations by giving each new class a short lecture.

'You 'ave joined the navy,' he used to say, glaring fiercely, 'to learn discipline, an' you've come to me to learn somethin' about gunnery, or as much of it as I can drive into your thick 'eads. The sooner we understand each other the better; an' before we start work I warns you that I'll stand no sauce from the likes o' you, so just bear it in mind. When I gives you an order I expects it to be obeyed at once, an' at the rush. I don't want no shufflin' about in the ranks, nor skylarkin' neither,' he added, gazing ferociously at Martin, who was endeavouring to remove a spot of moisture from the end of his nose without using a handkerchief.

'I wants to blow me nose,' murmured the culprit, reddening.

'An' I wants no back answers unless I asks you a question,' Breech went on, wagging an

admonitory finger. 'When you're standin' at attention you must keep still, no matter whether a moskeeter's bitin' you 'longside the ear'ole, or a wild monkey's chewin' your stummick. I wants you to look like a squad o' Henglish sailors, not a party o' mourners at a H Irishman's funeral, nor yet a gals' school out for a airin'. It's no laughin' matter, neither,' he continued, eyeing one of his pupils who had a suspicion of a smile hovering round the corners of his mouth. 'W'en I makes a joke you can laugh—bu'st if you like; but if I sees you laughin' when I'm not, that's hinsolence, an' you knows wot to expect.'

The smile vanished.

'I'm 'ere to enforce discipline,' the petty officer resumed, 'an' discipline I'll 'ave. I wants you to be smart, an' if I sees you're tryin' to learn I'll do my best for you. If I sees any one skylarkin' or talkin' in the ranks I runs 'im in at once, so don't forget it. To start with, I'm goin' to teach you the parts o' the rifle; an' w'en you knows that, we passes on to squad drill with an' without arms. Squad!—stand easy! This 'ere,' he explained, balancing a Lee-Enfield in his hand, 'is a magazine rifle, Lee-Enfield, Mark 1 star. Its weight is a trifle over nine pounds, as you'll find w'en you 'ave to carry it; an' its length, without the bay'nit, is four foot one an' a narf inches. This 'ere's the bay'nit, with a blade 'xactly twelve inches long, an' 'e fixes on to the muzzle o' the rifle, so. The bay'nit is only sharpened on the outbreak o' 'ostilities, an' is provided for stickin' your enemy; not, as most sailors thinks it's for, for openin' corned-beef tins, an' such like. 'Owever, we'll 'ave plenty o' bay'nit exercise later on.'

It took them a full day and a half to learn the ins and outs of the rifle; and, having mastered it thoroughly, the class passed on to squad drill and the rifle and field exercise. The greater number of them already had some smattering of these, but that fact did not prevent Petty Officer Breech marching and counter-marching them up and down the deck as if their very lives depended upon it. He kept up a running commentary the whole time.

'Squad!—shun! Stand at—ease! A little

more life in it; an' keep still when you 're standin' at attention, can't you? Knees straight, 'ead an' body erect, eyes straight to the front.—'Awkins, you 're waggin' your 'ead.—Flannagan, keep your knees straight, an' stand up.—Now then, try again. Squad!—shun! Ah, that's more like it now. Number! Form fours! As you were! A little life in it, please! Form fours! Right turn! Quick march! Come along, come along, step out smartly with the left foot, an' take a full pace. Left—left—left—right—left! Mark time! Pick your feet up! Pick 'em up! Bend the knees! That's more like it! For-ward! About turn! Not a bit like it. Squad!—halt! Left turn! Stand easy! Look 'ere, now. W'en I says, "About turn!" I don't want you to shuffle round any'ow. I gives the order "turn" as the left foot comes to the ground, an' each man turns on 'is own ground in three paces. At the fourth pace step off with the left foot in this manner.' He marked time himself, and proceeded to demonstrate how easy it really was.

For a whole week they were hard at it, learning to march, side step, change step, double, form fours, turn, and change direction. Sometimes, when one or other of the pupils was called out to drill the class, they got tied up into inextricable knots with the rear rank facing the front, and the men in their wrong places; but after seven hard days even Breech admitted that he was fairly satisfied with their progress.

Then they spent hours fixing and unfixing bayonets, ordering, shouldering, sloping, trailing, changing, grounding, and securing arms, until they were sick of the very sight of a rifle. It was dreary work—very dreary; and if they showed the least signs of slackness or inattention they were doubled round the deck until they were ready to drop from sheer fatigue, or did 'muscle drill' until their biceps ached.

They saluted mythical officers, varying in rank from the sovereign himself to second lieutenants and midshipmen, and attended imaginary funerals as the escort or firing-party. On these occasions Breech walked solemnly up and down to represent the officer or party to be saluted, or, in the case of the funerals, the corpse on its gun-carriage. 'The next time I passes I represents 'is Majesty the King inspectin' a guard o' honour, mounted at Bucking'am Palace,' or 'Now I'm a Field-Marshal,' and 'Now I'm a lieutenant in the navy,' he would say, approaching with what he considered the slow and stately gait befitting his exalted rank. 'Now I represents a regiment o' soldiers with their colours flyin'.' 'Now I'm the corpse comin' out o' the mortu-ary.'

The first time he made this last remark it caused the second man from the left in the rear rank to burst out into a raucous chuckle of amusement, and in another instant the whole class was tittering.

Breech fixed the culprit with a horny eye. 'There's not nothin' to laugh at, 'Awkins,' he observed without the ghost of a smile. 'This is a very sad occasion. You'll be the corpse yourself one day.'

They made pretty good progress on the whole—all except Peter Flannagan, that is. He was by way of being a 'bird'—a man who is constantly in trouble—and had already been through the gunnery-training class once, but had failed in the examination at the end of it. As a result he had been put back for a further period. He was naturally as obstinate as a mule, and unusually thick-headed; but, instead of doing his best with what wits he possessed, he endeavoured to show his superiority by taking as little trouble as he dared. He was Breech's *bête noire*; and, if ever anybody was wrong, it was pretty certain to be Flannagan. But he deserved everything he got, and was very unpopular with the others.

On one never-to-be-forgotten occasion the petty officer cautioned him for talking and joking in the ranks whilst at drill. The Irishman, in some fit of devilment, promptly repeated the offence, and, not content with that, put out his tongue to show his contempt.

Breech saw it. 'Flannagan,' he thundered in a voice of iron, 'come out to the front!'

The Irishman came out and stood before him with a sullen scowl.

'You disobeys my order wilfully, an' puts out your tongue,' the petty officer said. 'Disobedience an' hinsolence. 'Ave you anythin' to say?'

'Nothin', except that I'm fair fed up wi' bein' chased about this 'ere deck like a dawg.'

'Fed up, are you?' Breech answered, keeping his temper, but with a dangerous ring in his voice. 'You 'ave the himpertinence to spin me a yarn like that! If I chooses to take you on the quarterdeck, you gets a couple o' months in the detention quarters for hinsolence. But you're long past the stage where punishment'll do you any good. No; I shall 'ave to deal wi' you another way, my lad. I'll see that you're taken out o' the trainin' class, to start with, an' you comes an' reports yourself to me at five o'clock this evenin'. Now you takes off your accoutrements, returns your rifle, an' reports yourself to the capt'n o' your top. Perhaps 'e'll find some use for you; you're no good to me.'

Flannagan, rather ashamed of himself, slouched off.

What happened at five o'clock that afternoon the class never discovered; but the fact remains that Mr Peter Flannagan trod rather delicately, and had some slight difficulty in sitting down for the next ten days or so. Rumour had it that Breech, who was a powerful little man, had armed himself with a singlestick, and had taken the law into his own hands. Very reprehensible conduct on his part, no doubt, for it was strictly

against the regulations, and might have got him into trouble if the Irishman had lodged an official complaint. But Breech knew his victim to a nicety, and was perfectly well aware that he lacked the necessary courage to make the matter public. He knew, moreover, that to a man of Flannagan's type a little concentrated physical pain was far and away a better deterrent than any other form of punishment. Whatever his method was, it had the desired effect, for thereafter Ordinary Seaman Peter Flannagan treated Petty Officer Samuel Breech with a respect which almost amounted to reverence. A strong arm and a thick stick do sometimes achieve wonders.

Martin and the remainder of the class waxed hilarious over Peter's downfall. He was not popular. He was a K.H.B.,* and they were not sorry to be rid of his presence.

III.

The life, however, was not all work, and Martin found he had a certain amount of leisure for amusement. He was allowed ashore every alternate day from four o'clock in the afternoon till ten o'clock at night, and on Saturdays and Sundays from one-thirty.

The *Belligerent* ran her own football team—she ran everything, from a concert-party, a pipe-band, and a tame pig, to a monthly magazine (written, edited, and produced on board); and Pincher, who had been rather a shining light as a wing forward in his village team at home, invariably went ashore to watch the matches.

The squadron always played a football league competition during the winter, each ship playing every other vessel in turn, and the winner of the most points at the end of the season holding a challenge cup—presented by the flag officers and captains—for the ensuing year. In addition to this, the members of the winning team received personal prizes in the shape of inscribed silver medallions. The *Belligerent* had come out top in the league the year before, and the victorious team had promptly had their photographs taken, with, of course, the medallions and the cup; and the latter, enshrined in its glass case, now lived on the fore mess-deck as a tribute to their prowess. They were very proud of it. They were keen to win again, but rumour had it that the *Tremendous*, which had been newly commissioned, had a remarkably good team. Two of them were reported to be county players, so the 'Belligerents' were rather fearful of their laurels.

Now Martin, small and puny though he was, was fleet of foot and very tricky with his feet, but he was far too modest to let anybody know it. He always watched the matches, however, and took an intelligent interest in the games, and

eventually, by dint of being present on many occasions, found himself installed as a sort of honorary member of the team in the shape of their recognised touch-judge. He was even permitted to appear in the photograph which was taken soon after the ship arrived at Portland. He was in the back row, it is true, and wore his seaman's clothes instead of a highly coloured shirt, blue shorts, stockings, and football boots. But he carried a small hand-flag as his insignia of office, and considered himself no small beer in consequence. It was an honour to be associated with the team in any way; and as most of the officers, and practically the whole of the ship's company who happened to be ashore, made a point of attending the matches, Martin, running about with his flag, felt he was a—if not the—centre of attraction. At any rate, he was quite a personage, and talked about the game to the other ordinary seamen and boys with an air of great authority.

The scenes of excitement during some of the matches baffled description. 'Play up, Yaller-bellies!' two hundred of the *Belligerent's* men would shout in unison. The yellow referred to the canary-coloured shirts worn by their team, while the other rather inelegant word was the abbreviated name of the ship.

'Come on, the Cockneys!' or 'the Duffos!' would come the answering roar from the partisans of the other team, according to whether their ship hailed from Chatham or Devonport. 'Down wi' the Pompeyites!'

For minutes at a time the repartee bandied to and fro was so vociferous that the whistle was well-nigh inaudible; but the referee was used to it. He had an unenviable time in other ways, poor man! for whatever decision he gave was quite certain to be wrong from the point of view of fully half the spectators, in spite of the fact that he was a strictly neutral man from some other ship. 'Foul!' somebody would bellow, as the whistle blew for a free kick. 'Garn! That ain't no foul!' was hurled back from the men of the ship against which the penalty had been given. 'Play the game! Play the game, carn't you?' 'Goal! Well shot! Good old Yaller-bellies!' would come a roar, accompanied by a shower of caps in the air, as the ball flew past the white posts into the net. 'That's the style! Knock 'em end-ways!' 'Offside! Offside!' came louder yells from the other side. 'Where's the referee? What's 'e thinkin' of?' And so it went on.

But the referee, used to the ways of seamen, merely smiled, and paid no attention whatever to the ribald remarks hurled at his head, personal as some of them were. He was proof against such attacks, and his decisions were always fair.

Occasionally there were stormy scenes at the end of the matches; for when a favourite team had lost, their adherents were sometimes anxious

* K.H.B. = King's hard bargain, a term used in connection with a man who is an undesirable character.

to take on the partisans of the other side with their fists to discover which really was the better ship. More than once men returned on board with black eyes and swollen noses; but actual bloodshed was rare, though feeling always ran high. More often than not, victors and vanquished alike repaired to the canteen, and absorbed malt liquor at each other's expense, the former to celebrate the victory and the latter to drown their sorrow. They were very keen on the result of the league matches. The canteen did a roaring trade.

At one of the most important matches a member of the *Belligerent's* eleven happened to be absent at the time the game was due to start, and Lieutenant Boyle, who captained the team, was at his wits' end to find a suitable substitute. 'Have any of you men played this game?' he asked, going up to a group of seamen belonging to the *Belligerent* who had come to watch. 'Parkins hasn't turned up. We want a forward badly.'

Pincher, seizing the opportunity, stepped forward before any one else had a chance of answering. 'I've played at 'ome, sir,' he said, reddening at his own temerity. 'I used to be on the right wing.'

Boyle seemed rather surprised. 'You!' he said. 'Can you run? D'you know how to dribble and shoot?'

'Yessir.'

The officer looked at him for a moment without replying. He seemed rather doubtful.

'E's orl right, sir,' chipped in Billings, who happened to be present. 'E's pretty nippy on 'is feet. I've seen 'im kickin' the ball abart.'

The lieutenant looked up with a laugh. 'All right, Billings. We'll take him on your recommendation.—Martin, rush across to the pavilion and borrow some gear. Hurry up about it; we're late already.'

Pincher, overjoyed and very proud of himself, flew off like the wind, and presently reappeared

clad in full regalia, yellow shirt and all. It was his first really important match; but he felt he was on his mettle, and played well, almost brilliantly. At any rate, he shot two goals; whereat the 'Belligerents' howled themselves hoarse, raised cheers for 'young Pincher,' and wished to treat him with much beer at the end of the game. It was the first time in his life he had ever received adulation, and he was a proud man. His play had undoubtedly helped to win the match.

He was prouder still when Boyle sought him out afterwards. 'You played excellently, Martin,' he said. 'Why on earth didn't you let us know you played?'

'Didn't like to, sir.'

The officer laughed. 'I wish you men wouldn't be quite so modest,' he remarked. 'How d'you expect us to raise a decent team if you all hide your lights under bushels? You're the very man we've been looking for.'

'I'm sorry, sir,' said Martin sheepishly. 'I didn't know as 'ow I wus wanted.'

'We didn't know you were a player. However, now we've got you, you will remain in the team; so look out you keep yourself in decent training. A pint of beer after each game, and no more, mind. If you come to my cabin this evening I'll give you your jersey and other gear.' The lieutenant strolled off to change.

Martin could have jumped for joy. He was a full-fledged 'Yellow-belly' at last, and would appear before the whole ship's company in all the glory of a canary-yellow shirt with a large blue 'B' on the left breast. It was one of the things in this world he had been longing for. He was no longer a mere excrescence on the face of the earth—a poor, puny Pincher who was everybody's whipping-boy. On the contrary, he was a very proud Pincher, for at last he had come into his own. The *Belligerent* had some use for him, after all.

(Continued on page 387.)

'THE BEST JOB IN THE ARMY.'

A SUPPLY OFFICER'S WORK ON ACTIVE SERVICE.

By a S.O.

'BRIGADE Supply Officer, are you? Best junior job in the army, young man. You're a lucky young devil!' These were the words with which a senior officer congratulated a subaltern acquaintance upon his appointment to the office of S.O. recently. Whether it is actually the 'best job in the army' is open to doubt; but it is certainly one of the most interesting, if being close in touch from time to time with possibly every unit in a division implies interest.

Supplies—that is, supplies in the usual sense of the word: meat, bread, groceries, forage, disinfectants, oil, and commodities of a similar nature—are sent up from the base depots by train to railhead, a railway station with a goods-yard, as far advanced towards the trenches as is consistent with safety and general convenience. They are sent up for an ordinary infantry division in quantities known as standard packs—food for twenty thousand men and six thousand horses. At railhead the train is off-loaded into

the motor-lorries of the Mechanical Transport, A.S.C. (Army Service Corps).

Now every division for supply purposes is divided into groups, generally four or five in number: three brigade groups—that is, an infantry brigade, and any sappers, gunners, or other units situated near that brigade—and a divisional troops group, comprising any units that have not been dealt with in one of the brigade groups. The fifth may be a fairly large unit alone—for example, a divisional ammunition column—which for the proper performance of its duties is so far behind the actual firing-line that the mechanical transport lorries can deliver its food to it direct.

At railhead, therefore, the fleet of M.T. lorries is divided into sections corresponding to these groups, and the supplies loaded accordingly. They are then sent out from railhead at an appointed time each day, and deliver supplies to 'refilling point,' where they dump them in the presence of the group supply officer, to whom they are consigned. And it is at refilling point, a spot convenient for the loading of horse transport wagons between railhead and the first line transport lines of the battalions of a brigade, that the S.O.'s duties commence.

There is scope for the exercise of some ingenuity in the selection of a refilling point, a job which falls sometimes on the D.A.Q.M.G. (Deputy Assistant Quartermaster-General), sometimes on the senior supply officer, and less often on the supply officer personally concerned, for it has to suit the convenience of both the horse and mechanical transport, and be large enough for distributing and loading purposes.

To this point, then, at, say, seven A.M., roll up the great three-ton lorries filled with the soldiers' food, and accompanied by an officer in a car (the road officer, M.T.) and a sergeant on a motor-bicycle. They draw up under the direction of the S.O. (Supply Officer), who is absolute master of the ceremonies at refilling point.

Alongside a bit of waste ground at the edge of the road are the loaders and quartermaster-sergeants of the battalions and other units in the brigade group. In addition to the infantry, there may be represented a company of Royal Engineers, a field ambulance, a brigade of gunners, and the divisional cyclist company. Each unit has sent its representatives to refilling point, and these men, together with the mechanical transport loaders, seize upon the boxes and crates, the frozen meat, biscuits and bread, oats and hay, and heave them down upon the side of the road, arranging them under the direction of the supply officers' clerks and issuers, who are checking them over.

Meanwhile the S.O. compares his list of supplies required with the list sent up by the authorities at railhead, and then both lists with those made out by his men who have been checking the supplies actually on the ground

before them. These lists should all agree. If they do not, then the discrepancies are noted, and railhead notified, also the senior supply officer, who will later on make his round of the refilling points.
